PREFACE.

IN the preparation of the INTERNATIONAL YEAR BOOK constant effort has been made not only to state fact accurately and reflect comment fairly, but, what is more difficult, to set forth both fact and comment in their true perspective. The present volume, covering the year 1902, shows, without sacrifice, the editors believe, a greater degree of compression than its predecessors; in concise and logical treatment an advance has been made that renders the book especially useful. Though the plan originally adopted for this series of annuals has been virtually adhered to, each succeeding volume in various particulars has shown some improvement in presentation and scope. Two such departures that may be pointed out in the volume for 1902 are the grouping of Congressional Representatives under that sub-head in the article UNITED STATES, rather than placing them with their respective States, and the itemizing of the State revenues and expenditures, by which the sources and purposes as well as the volume of State moneys are readily seen. The editors are desirous of increasing the usefulness of the work and will welcome suggestions to that end.

A preface cannot be an adequate guide to the numberless topics of interest treated in a volume of this nature. There may be mentioned, however, a few of the more important events of 1902; and these, in some degree, will serve to show how conspicuous a position that year holds in contemporary history. In the UNITED STATES the subject of keenest general interest was the ANTHRACITE COAL STRIKE, provoking Presidential intervention, which in the future may be turned to as an important precedent, and drawing more general attention both to TRADE UNIONS and to TRUSTS. Further thought concerning the problems of organized labor and of organized capital was occasioned by other STRIKES of the year and by the progress of SOCIALISM and the accomplishment of the SHIPPING MERGER. The year was notably a prosperous one. The articles BANKS and FINANCIAL REVIEW show the most important financial conditions and movements, while industry is treated, aside from the articles on the States, under MANUFACTURES and such special titles as IRON AND STEEL, COTTON, SUGAR, etc. Agricultural production, as well as the progress in cultural methods, is treated under AGRICULTURE, DAIRYING, HORTICULTURE, and in the articles on the various crops. The year 1902 saw the establishment of civil government in the Philippines, and, at home, in the sphere of MUNICIPAL GOVERNMENT, the disclosure of most vicious corruption.

In international affairs there was a marked development of already existing tendencies. INTERNATIONAL ARBITRATION was more firmly established. The Anglo-Boer War came to an end and British power in the TRANSVAAL and other parts of South Africa increased. There were concluded an Anglo-Chinese treaty of commerce affecting CHINA proper, and an Anglo-Japanese treaty of alliance designed to maintain generally the prestige of GREAT BRITAIN and JAPAN in CHINA and COREA, while in menace to such prestige was the attitude of RUSSIA in MANCHURIA. Russian designs against PERSIA and British interests there continued to manifest themselves, as well as those of FRANCE against SIAM. While RUSSIA and FRANCE practically reaffirmed their alliance, as an answer to the Anglo-Japanese treaty, FRANCE and ITALY and FRANCE and SPAIN noticeably furthered their cordial relations. The ill-feeling between the English and German peoples showed little abatement in 1902, although at the end of the year the British and German governments were allied in coercing VENEZUELA. The troublesome question of the TRIPLE ALLIANCE was settled by a renewal of that pact. Ominous troubles in the BALKAN PENINSULA,

and especially in TURKEY, continued. Conspicuous in 1902 was the effective position assumed by the UNITED STATES.

In the internal affairs of foreign countries there were many events worthy of note—some for passing but compelling interest, others for far-reaching significance. EDWARD VII was crowned and ALFONSO XIII. enthroned; in GREAT BRITAIN the most vigorously debated question of the year was the quasi-denominational Education Bill, which was enacted, and in SPAIN the proposed anti-clerical reforms, which failed of achievement. In FRANCE, however, under the direction of a new ministry, anti-clerical legislation was rigorously enforced. In GERMANY the Tariff Bill, and in AUSTRIA-HUNGARY the renewal of the *Ausgleich* were the prominent features. The threatening cry of united labor was heard in FRANCE, SPAIN, ITALY, BELGIUM, AUSTRIA-HUNGARY, SWEDEN, and even RUSSIA. RUSSIA, indeed, saw bloody assaults upon the established régime, but in FINLAND the government's policy of "Russification" went steadily on. Almost simultaneous with Alfonso's enthronement was the establishment of his lost colony, CUBA, as an independent republic.

The progress of educational institutions in 1902 and of the science of education itself is shown in the articles on many of the leading colleges and in those under the headings UNIVERSITIES AND COLLEGES and EDUCATION IN THE UNITED STATES, while a statistical treatment of schools is given under SCHOOLS, NORMAL SCHOOLS, and PROFESSIONAL SCHOOLS. A comprehensive treatment of religious progress has been subdivided under the titles of the various denominations, while missionary work in particular is treated under MISSIONS.

In science must be noted the stellar researches of Kapteyn and the light-pressure theory of Arrhenius, in ASTRONOMY; in PHYSICS, the study of radio-active substances, which involves many problems for the further investigation of scientists; the advances made in CHEMISTRY, MEDICINE, and BIOLOGY; the continued effort to solve practically the problem of AERIAL NAVIGATION; and the remarkable progress of WIRELESS TELEGRAPHY. Among the notable engineering topics is the great DAM at Assuan and the GALVESTON SEA WALL. The articles on ARCHÆOLOGY and ANTHROPOLOGY have features of unusual interest. The year 1902 was unique in the number and severity of its volcanic and seismic disturbances. A treatment of these may be found under VOLCANOES and EARTHQUAKES and in the articles on the countries where they occurred, especially MARTINIQUE, St. VINCENT, and GUATEMALA.

Especial care has been taken in preparing the department of biography. The names of many living men who were prominent in 1902 are included. Among the scores of notable dead may be mentioned CECIL RHODES, KOLOMAN TISZA, Lord DUFFERIN, THOMAS BRACKETT REED, RUDOLF VIRCHOW, FREDERICK TEMPLE, EUGENE AUGUSTUS HOFFMAN, T. DE WITT TALMAGE, WILLIAM THOMAS SAMPSON, BRETT HARTE, and EMILE ZOLA.

To this YEAR BOOK is appended an index of the titles in the five volumes 1898-1902.

The International Year Book 1902

ABEL, Sir FREDERICK AUGUSTUS, English chemist, died in London, September 6, 1902. He was born in London, July 17, 1827, and after study at the Royal Polytechnic became a student at the Royal College of Chemistry which was opened in 1845 under the direction of A. W. Hofmann, in the endeavor to establish in London a counterpart of Liebig's famous school at Giessen. In 1851 Abel succeeded Faraday as professor of chemistry at the Royal Military Academy, and in 1854 he was appointed to the newly created office of Ordinance Chemist, later styled Chemist to the War Department. During his long tenure of this office (until 1888), which was identical with the development of the British artillery and rifle systems, he effected marked improvements in the manufacture and application of gun cotton; and as president of a special committee on explosives (1888-91), he conducted investigations which resulted in the patenting, with Professor Dewar, of the substance known as "cordite." At various times he was president of the British Association, the Chemical Society, the Society of Chemical Industry, the Institute of Chemistry, and the Institute of Electrical Engineers; and at the foundation of the Imperial Institute in 1887 he was made organizing secretary and general director. He was awarded a medal in 1887 by the Royal Society, of which he became a fellow in 1860, and in 1897 he received the Bessemer medal from the Iron and Steel Institute. In 1883 he was knighted and ten years later was created a baronet. Among his publications are *Gun Cotton* (1866); *The Modern History of Gunpowder* (1866); *On Explosive Agents* (1872); *Researches in Explosives* (1875); *Electricity Applied to Explosive Purposes* (1884).

ABRASIVES. See MINERAL PRODUCTION.

ABYSSINIA, an independent country of eastern Africa, separated from the sea by British, French, and Italian territory. The capital is Adis Ababa.

Area and Population.—The estimated area of Abyssinia proper, including the four provinces of Tigré, Shoa, Amhara, and Godjam, is about 100,000 square miles, and dependent territories are estimated at about 50,000 square miles. On May 15, 1902, agreements were signed determining the boundaries of Abyssinia with the Egyptian Soudan and Eritrea. The estimated number of inhabitants, who in large part profess a perverted form of Christianity, is about 3,500,000.

Government, etc.—The present emperor, Menelek II., who as king of Shoa became ruler of all Abyssinia in 1889, maintains a sort of feudal political system with the *rases*, princes, under whom are governors of districts and chiefs of villages. Beside territorial troops and irregulars there is an army of 150,000 men made up of provincial contingents. Revenue is derived chiefly from tithes and taxes on commodities. Menelek has a monopoly of the ivory trade and keeps the greater part of the gold output. There is also a revenue from import and export duties.

Industries and Commerce.—The principal industry of the inhabitants is the raising of cattle and sheep. The greater part of the imports consists of cotton goods manufactured in the United States; other imports are woollen goods, cutlery, glassware, provisions, matches, and arms. The exports include coffee, civet, wax, gold, and ivory. For the fiscal year 1900 the trade of Harar and Adis Ababa was estimated at 6,799,650 dollars for imports and 4,947,000 dollars for exports. (The Abyssinian silver dollar in 1902 was worth about forty-seven cents in United States money.)

In the summer of 1902 it was reported that Menelek had sold to an English syndicate for £2,000,000 the Baro gold mines, which it was believed he had promised to grant to French companies, and that he then determined to grant no more concessions to Europeans. The gold-mining grants extend for about 200 miles on both banks of the Baro River.

Communications—The railway which is under construction from Jibouti, on the coast of French Somaliland, to Harar, 186 miles distant, was completed to the 125th mile at the end of 1901. It is thought that this line may be extended to Adis Ababa and ultimately to the projected Soudan section of the Cape-to-Cairo railway. (See SOMALILAND.) There are telegraph and telephone connections between Adis Ababa and Harar. The telephone line, which is much used, was at first frequently cut, but such mischief was stopped by a proclamation of Menelek that any person offending thus would be punished by having his hand struck off, and the district in which injury was done condemned to pay a heavy fine. Early in 1902 it was reported that Menelek had ordered the rapid completion of telegraph and telephone lines between Adis Ababa and Massowah, on the coast of Eritrea.

It is highly probable that were it not for the vigor and shrewdness of Menelek's statesmanship European influence, which is maintained at Adis Ababa by representatives of Great Britain, France, Italy, and Russia, would be a far more positive element in Abyssinian politics than it is at present. The country is of especial interest to Great Britain as one of the sources of the Nile; to France it is the goal, by way of French Somaliland, of commercial enterprise, which if ever the opportunity offers will develop into political activity for the territorial union of her eastern and central African possessions, while Russia, in perhaps not too positive and open a manner, stands ready to second France in such a confounding of the British programme in Africa; and Italy, though unforgetful of Menelek's check to her colonial aspirations in 1896, seems to crave Abyssinian influence and privileges. In 1902 documents published through the indiscretion, it was believed, of Signor Martini, governor of Eritrea, revealed unexpected relations between Italy and Abyssinia. In the preceding year it appears the Eritrean government secured rights to open to Italian enterprise the Abyssinian country south of the Mareb River; and it was also stated that certain lands bordering the eastern Soudan, rights in which Menelek had formerly granted to the Anglo-Egyptian government, had been given over to the Italian authorities. But notwithstanding these disclosures or the special embassy, including the governor of Adis Ababa and the chief of the exchequer, sent by Menelek to St. Petersburg in the summer of 1902, the emperor's relations with Great Britain seemed to continue very friendly. An Anglo-Abyssinian treaty concluded at Adis Ababa on May 15, 1902, was ratified October 28. It obtains for the Anglo-Egyptian government the lease of territory near Itang on the Baro River, as a commercial station, and the permission to construct through Abyssinian territory a railway connecting the Soudan with Uganda. Of most importance, however, as insuring a continued water supply to Egypt, was the engagement of the signatory parties "not to construct, or allow to be constructed, any work across the Blue Nile, Lake Tsana, or the Sobat which would arrest the flow of their waters into the Nile." In 1902 it was reported that Menelek was preparing to make certain civil service reorganizations, to open schools for the teaching of European languages, and to build a new city a few miles from Adis Ababa.

ACADÉMIE FRANÇAISE, founded by Cardinal Richelieu in 1635 and reorganized in 1810, is the first in order and most eminent of the five academies which constitute the Institute of France. The membership of the Académie Française is limited to forty (known as the "Forty Immortals"), who are elected for life and represent literature, science, the fine arts, etc. There was no election in 1902. The members receive an annual stipend of 1500 francs and in addition, the six members of the dictionary committee receive each 1000 francs annually. The Académie distributes 12,000 francs annually in prizes alternately for poetry and eloquence, besides a number of smaller prizes. Permanent secretary, Marie Louis Antoine Gaston Boissier.

ACADEMY, BRITISH, founded in 1902 by King Edward VII. in London, has for its object the promotion of historical, philosophical, and philological studies. Lord Reay, chairman of the London school board and president of the Royal Asiatic Society and of University College, was made the first president. The fellows of the academy are as follows: Lord Reay; the Earl of Rosebery; Viscount Dillon, president of the Society of Antiquaries; Arthur Balfour, M. P.; John Morley, M. P.; James Bryce, M. P.; W. E. H. Lecky, M. P.; Sir William Anson, warden of All Souls' College, Oxford; Sir Frederick Pollock, Corpus professor of jurisprudence, Oxford; Sir Edward Maunde Thompson, director and principal librarian, British Museum; Sir Henry Maxwell-Lyte, deputy keeper of the public

records; Sir Courtenay Ilbert, parliamentary counsel to the treasury; Sir Richard Jebb, M. P., Regius professor of Greek, Cambridge; Dr. Monro, provost of Oriel College and vice-chancellor of Oxford University; Dr. A. W. Ward, vice-chancellor of the University of Cambridge; Dr. Edward Caird, master of Balliol College, Oxford; Dr. H. F. Pelham, president of Trinity College, Oxford; Dr. John Rhys, principal of Jesus College and professor of Celtic, Oxford; Rev. George Salmon, D. D., provost of Trinity College, Dublin, Dr. J. B. Bury, Regius professor of Greek, University of Dublin; S. H. Butcher, professor of Greek, Edinburgh University; Ingram Bywater, Regius professor of Greek, Oxford; E. B. Cowell, professor of Sanskrit, Cambridge; Rev. William Cunningham, D. D.; Rhys Davids, professor of Pali, University College, London; Albert Dicey, K. C., Vinerian professor of English law, Oxford; Rev. Canon S. R. Driver, D. D., Regius professor of Hebrew, Oxford; Robinson Ellis, Corpus professor of Latin, Oxford; Arthur John Evans, keeper of the Ashmolean Museum, Oxford; Rev. A. M. Fairbairn, D. D., principal of Mansfield College, Oxford; Rev. Robert Flint, D. D., professor of divinity, Edinburgh; J. G. Frazer, fellow of Trinity College, Cambridge; Israel Gollancz, university lecturer in English, Cambridge; Thomas Hodgkin; S. H. Hodgson (metaphysician); T. E. Holland, professor of international law and diplomacy, Oxford; F. W. Maitland, Downing professor of English law, Cambridge; Alfred Marshall, professor of political economy, Cambridge; Rev. J. E. B. Mayor, professor of Latin, Cambridge; Dr. J. A. H. Murray, editor of the *Oxford English Dictionary*; W. M. Ramsay, professor of humanities, University of Aberdeen; Rev. Canon William Sanday, D. D.; Lady Margaret professor of divinity, Oxford; Rev. W. W. Skeat, Elrington and Bosworth professor of Anglo-Saxon (Celtic scholar), Cambridge; Sir Leslie Stephen; Whitley Stokes; Rev. H. B. Swete, D. D., Regius professor of divinity, Cambridge; Henry Fanshawe; Rev. H. F. Tozer; Robert Yelverton Tyrrell, University of Dublin; and James Ward, Cambridge.

ACTON, Sir JOHN EMERICH EDWARD DALBERG-ACTON, eighth Baronet and first Baron Acton of Aldenham (County Salop), eminent English scholar, died at Tegernsee, Bavaria, on June 19, 1902. He was born at Naples, Italy, in 1834, studied at the Academy of St. Nicholas du Chardonnet, France, and at the school of Oscott, near Birmingham, during the presidency of Dr. (later Cardinal) Wiseman. Having been refused admission to Cambridge on account of his religion (Roman Catholic), he became a private pupil of Dr. Döllinger at Munich, and there characteristically introduced his more serious studies by reading in a few weeks the forty-five volumes of Michaud's *Biographie Universelle*. In 1857 he travelled with Dollinger in Italy, and shortly afterward visited the United States. He sat in Parliament for Carlow in 1859-65, was returned for Bridgnorth in 1865, but in the year following was unseated. In 1869 he was raised to the peerage and entered the House of Lords, but his legislative career was inconspicuous. He took no part in Parliamentary affairs, he once said, because he agreed with no one and no one agreed with him. It has been asserted, however, that his advice had great influence over Mr. Gladstone. From 1862 to 1864 he edited the noteworthy *Home and Foreign Review*, which was discontinued because of the offence given to the authorities at Rome by its opposition to Ultramontanism and support of Liberal Catholicism. Subsequently he published the *North British Review*—which, rather oddly, had once appeared under the auspices of the Scottish Free Church—in the interests of ecclesiastical and political liberalism. He was at Rome in 1870, and stoutly contested the promulgation of the dogma of papal infallibility. In 1874 he seconded Mr. Gladstone in the well-known controversy on "Vaticanism" by the publication in the *London Times* (November 9, 24, 30; December 12), of four letters presenting the most effective arguments against Ultramontanism ever advanced within so brief a compass. He received the appointment of lord-in-waiting in 1892, and in 1895 that of Regius professor of modern history at Cambridge in succession to Sir John Seeley. Lord Acton was often termed the first scholar of Europe. His erudition was little short of marvelous. He collected a working library of 80,000 volumes, read an octavo a day when in harness, possessed an impeccable memory, and developed an extensive system of notes. In brilliant and learned talk he is declared the equal of Macaulay. Yet he was a notable example of what has been called "the reticence of learning." He wrote comparatively little, and always obscurely. His uncollected writings include a brief list of important articles, such as those on German schools of history and the Massacre of St. Bartholomew, and his Cambridge inaugural, published in 1895 under the title of *The Study of History*. He also furnished the introduction to L. Arthur

Bird's edition of the *Il Principe* of Machiavelli, published by the Clarendon Press. His incumbency of the Regius chair gave a marked stimulus to historical studies in the university.

ADAMS, CHARLES KENDALL, an American historian and educator, died at Redlands, Cal., on July 26, 1902. He was born in Vermont, at Derby, January 24, 1835. was educated at the University of Michigan and in Europe, was assistant professor of history at Michigan in 1863-67, occupied the chair of history in that institution from 1867 to 1885, and held the position of dean of the school of history and political science after its organization. In 1885 he succeeded Andrew D. White (*qv.*) as president of Cornell University, and in 1892 became president of the University of Wisconsin, retaining the latter position until shortly before his death. In 1890 he was president of the American Historical Association, in whose organization he had taken prominent part. Through the foundation of the historical seminary at Michigan in 1869, he was the first to introduce into the United States the German *seminar* method of instruction. He contributed numerous papers on topics of history and education to various magazines, was editor-in-chief of *Johnson's Universal Cyclopædia* (1892), and published *Democracy and Monarchy in France* (1872; in a German version, 1873); a *Manual of Historical Literature* (1882); *British Orations* (1884); and *Christopher Columbus, his Life and Work* (1892).

ADAMSON, ROBERT, a Scottish philosopher, died at Glasgow in February, 1902. He was born in 1852, the son of Robert Adamson, a writer of Edinburgh, and received his education in his native town. When he was twenty-four years of age he succeeded Prof. Stanley Jevons in the chair of logic and mental philosophy at Owens College, Manchester. In 1893 he was elected to the chair of logic in the University of Aberdeen, and two years later accepted the professorship of logic and rhetoric in Glasgow University. He was the author of the article on "Logic" in the *Encyclopædia Britannica*; a volume on Fichte (1881), which appeared originally in the *Blackwood Philosophical Series*; *The Philosophy of Science in the Middle Ages* (1876); *On the Philosophy of Kant* (1879). He had in preparation at the time of his death a *History of Psychology*, and *Kant and the Modern Naturalists*. He held the degrees of Master of Arts and Doctor of Laws.

ADDICKS, JOHN EDWARD, a Delaware politician, again attempted, in 1902, to obtain control of the Republican element in the State legislature which would assure his election to the United States Senate. He was born in Philadelphia, Penn., November 21, 1841, and after receiving a high school education began his remarkable business career as clerk in a wholesale dry goods house. After four years he entered the employ of a flour and feed firm in which he was made a partner by the time he was twenty-one. Early in the 80's he branched out for himself, and his sharp business sense, assurance and persistence brought him success and a reputation as a promoter of business corporations and combines. His first and greatest success was his organization and control of the Bay State Gas Company in Boston. As the scope of his activities extended and his wealth became greater the desire for political power seems to have taken possession of him, and he removed to Delaware, whose legislature he had found tractable in connection with securing control of the Wilmington gas supply. He was laughed at when he first broached his ambition for senatorial honors in 1888, and the Republican majority gave the election to Anthony Higgins. The State went Democratic again in 1892, and it was not until 1894 that he had another opportunity. This time his ambition was thwarted by the Republicans, who supported Col. H. A. DuPont, and there was no choice for the vacancy. The fight disrupted the party, the Addicks faction being known henceforth as "Union Republicans." In 1896 a Democratic legislature sent Richard R. Kenney to the Senate for the last four years of the term. In 1898 the expiration of Senator Gray's term left a vacancy which the split in the Republican party made it impossible to fill. In 1900 there was a repetition of the struggle of former years, but the regular Republicans again prevented Addicks's election. From that time to the close of 1902 Delaware was unrepresented in the Senate. For the renewal of the struggle in 1902 see DELAWARE (paragraph Politics).

ADEN, a British dependency in southwestern Arabia, about 100 miles east of Bab-el-Mandeb. The area, including the small island of Perim, is stated at 80 square miles; the population (1901), 41,222. Aden, which is administered by a political resident under the Bombay government, is invaluable to Great Britain as a coaling station and a *point d'appui* for the Indian trade. The commerce is almost entirely in transit. In the fiscal year 1900 imports and exports amounted to 44,264,556 rupees (32.4 cents each) and 35,244,515 rupees respectively; in 1901, 38,363,909 and 33,554,811 respectively.

Some friction occurred in the fall of 1902 between Great Britain and Turkey on

account of the encroachment of Turkish troops in the disputed Aden hinterland. The Porte held that the troops should remain until the frontier questions were settled, but in November acceded to the British demand that they be withdrawn pending the decision of the Anglo-Turkish boundary commission.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE, organized 1848, includes in its membership the best known scientists of the country. A number of leading scientific societies are affiliated with the association, which serves as a centre for their meetings. The association meets in sections, which are: (a) Mathematics and Astronomy; (b) Physics; (c) Chemistry; (d) Mechanical Science and Engineering; (e) Geology and Geography; (f) Zoology; (g) Botany; (h) Anthropology; (i) Social and Economic Science; (k) Physiology and Experimental Medicine. The annual meetings of the association are held each time in a different city. The association held its fifty-first annual meeting at Pittsburg, Pa., June 28-July 3, 1902, under the presidency of Professor Charles S. Minot, of Harvard University, who delivered the opening address on *The Problem of Consciousness in Its Biological Aspects*. Professor Asaph Hall, also of Harvard, was the retiring president. The total number of members in attendance was 431, which number included an unusual proportion of the leading American men of science. The papers read and the addresses and lectures delivered numbered nearly 350. Among these were a lecture on *The Prevention of the Pollution of Streams by Modern Methods of Sewage Treatment*, by Dr. Leonard P. Kinnicutt; an illustrated lecture on the Martinique eruption, by Mr. Robert T. Hill, U. S. Geological Survey; *The Group Velocity and Wave Velocity of Light*, by Prof. D. B. Brace; *Pre-Historic Porto Rico*, by Dr. J. Walter Fewkes; and a paper on *Applied Botany, Retrospective and Prospective*, by Dr. B. T. Galloway. The financial report showed a balance in the treasury to the credit of the association amounting to \$12,285.83. Seventy-three new members were elected at the meeting. The fifty-second annual meeting of the association was held at Washington, D. C., December 29, 1902-January 3, 1903, under the presidency of Dr. Ira Remsen, of Johns Hopkins University, and was the first held during the newly arranged convocation week as agreed to by 54 prominent American educational institutions. The membership of the association at the close of the Pittsburg meeting showed a total of 3,473. This was augmented by the election of 392 members at the Washington meeting. The association is now the largest and most representative body of scientific men in America. Among the scientific societies affiliated with it are: The American Mathematical Society, the Astronomical and Astrophysical Society of America, the American Physical Society, the American Chemical Society, the Society for the Promotion of Engineering Education, the Geological Society of America, the Botanical Society of America, the Society for the Promotion of Agricultural Science, the American Forestry Association, the Association of Economic Entomologists, the American Psychological Association, the American Anthropological Association, and the American Society of Naturalists, with its special societies. Among the resolutions offered was one urging upon Congress the duty of making full provision for the support of the family of the late Major Walter Reed, surgeon in the United States Army, in appreciation of his far-reaching and invaluable services in solving the problem of the mode of spread of yellow fever and the discovery of methods, already successfully tested in Cuba, of eradicating the pestilence. The next meeting will be held December 28, 1903-January 2, 1904, in St. Louis, Mo., under the presidency of Hon. Carroll D. Wright, U. S. commissioner of labor. Permanent secretary, Dr. L. O. Howard, Cosmos Club, Washington, D. C. See ZOOLOGICAL SOCIETIES.

ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE, founded in 1831, held its annual meeting at Belfast, September 10, 1902, and following days. President James Dewar, in his opening address, discussed exhaustively the efforts that have been made to investigate the effects of extreme low temperatures upon gases. In section A (Mathematics and Physics) Professor Schuster, president of the department of Astronomy and Cosmical Physics, called attention to the waste of power displayed by investigators in meteorology and other sciences by devoting their energies almost exclusively to the collection of observations. As a result, undigested data are accumulating to too great an extent. In the discussion that followed, Dr. Shaw, head of the Meteorological Office, suggested as a remedy the establishment of professorships in meteorology in some of the universities. The question whether motion through the ether causes double refraction of light in transparent bodies was discussed by Lord Rayleigh. In section B (Chemistry) considerable interest was taken in the discussion of two monographs on *Hydro-Aromatic Compounds* and *Aromatic-Diazo Compounds* by Dr. A. W. Crossley and

Dr. G. F. Morgan. These monographs are to be published at length in the annual report. A paper on the *Alkylation of Sugars*, by Prof. T. Purdy and Dr. J. C. Irvine was also presented. In section C (Geology) President C. A. McMahon, F. R. S., dealt with the general principles of rock metamorphism; a paper by Mr. George Barrow on *The Prolongation of the Highland Border Rocks into County Tyrone*, and a lecture by Professor Grenville A. J. Cole on *The Structure of Ireland*, were warmly discussed. A number of other interesting papers in the same line were also presented. In section D (Zoology) President Howes traced the advances made in the knowledge of the animal kingdom and the inter-relationships of its various groups through the application of the morphological method. Papers of great practical importance were presented by Professor McIntosh and Mr. Garstang on the international scheme for the protection and development of the North Sea fisheries. The introduction of more scientific methods in geographical work, especially in the work of exploration, was the theme discussed by Sir Thomas Holdich, president of section E (Geography). His views were in a great measure sustained in papers read by Professor Libbey, Dr. Herbertson, Professor Watts, Mr. Lloyd Praeger, Mr. R. B. Buckley, and others. The address of President Cannan (section F, Economical Science and Statistics), was an application of the theory of rent to the question of municipal housing and other municipal ventures. A paper was also presented from an opposite point of view, which condemned unhesitatingly all productive municipal enterprises. The discussion, however, was not sufficiently long or representative to cover the ground adequately. The possibilities and future of commercial education also came in for a considerable share of discussion. In section G (Engineering and Mechanical Science) the president, Professor John Perry, F. R. S., dealt with the subject of the education of the engineer, insisting on the continual use of experiment by the student himself as distinguished from oral lecture or demonstration by the professor. The address was subsequently made the subject of discussion at a joint meeting of the engineering and educational sections, under the presidency of Professor Armstrong, during which the subject *The Science of the Workshop* was debated. In section H (Anthropology) the discussions evoked by the quality and variety of the papers presented were unusually interesting. The president's address was devoted to the much-debated question of the nature and origin of totemistic observances among uncivilized peoples. A number of archaeological papers were presented and read. In the meetings of section I (Physiology) experimental and morphological contributions received attention and criticism. Professor Halliburton's presidential address emphasized the importance of chemical physiology. A paper on color-vision by Dr. Edridge-Green was read and discussed. A morphological and physiological paper by Dr. John Turner was presented and caused considerable discussion. Prof. J. R. Green in his presidential address (section K, Botany) emphasized the study of vegetable physiology, not merely on account of its intrinsic value in special botanical problems, but as a subject of fundamental economic importance in relation to agriculture. The papers read in this section were of considerable interest. The president of section L (Educational Science) took for the subject of his discourse *The Scientific Use of the Imagination*. In eloquent and forcible language he presented the view that the domination of the schools by the classic and the cleric has led to a serious disuse of the imagination, and he laid down a doctrine of education and an ideal of the function of the school that are far removed from those at present accepted by the great body of schoolmasters. A paper on *Recent Reforms in Irish Education* was presented by Dr. Starkie and caused considerable discussion. A valuable paper presented by Mr. P. J. Hartog on *The Teaching of English* drew attention to the method of teaching style in composition adopted in the principal French schools, and condemned the existing assumption that the only method of teaching English composition and style must be through the medium of Greek and Latin, of which the average schoolboy has not obtained a real grasp. An event of the meeting was an address by Prof. C. S. Minot, president of the American Association for the Advancement of Science, in which he extended an invitation to the members of the British association to attend the meeting of the former association at Washington, D. C., in December, 1902, which was accepted by Professor Dewar on behalf of his association. See ZOOLOGICAL SOCIETIES.

ADVENTISTS, popularly known also as Millerites, a name derived from that of their founder. Varying doctrinal views are held by the six divisions that form the denomination: Evangelical, Advent Christians, Seventh Day Adventists, Church of God, Life and Advent Union, and Church of God in Jesus Christ. In the United States the Adventists number 98,487, with 2402 churches and 1554 ministers. The Seventh Day Adventists, organized in 1844, constitute the most numerous branch of the denomination, having 78,188 communicants, of whom more than 63,500 are in the United States, 2011 churches, and 553 ordained ministers. Under the auspices of this body there are 8 colleges and 15 academies and industrial

schools, and 11 publishing houses, its headquarters being at Battle Creek, Mich. The next session of the general conference will be held in California, March 27 to April 13, 1903. Next in numerical strength after the Seventh Day Adventists are the Advent Christians with a membership approximating 25,000, and churches and conferences in nearly all of the States. They have about 900 organized churches and 1000 ministers. The Advent Christian Publication Society has headquarters in Boston, where the *World's Crisis* is issued, and there are three other denominational publishing houses. Two ministerial training schools, in Boston and in Mendota, Ill., are maintained; and foreign missionary work is conducted through the American Advent Mission Society in China, India, and the Cape Verde Islands.

AERIAL NAVIGATION. Attempts to solve the problem of aerial navigation were notably fewer in 1902 than for several years previous. Mr. Santos-Dumont, whose successful efforts at sustained flight in dirigible balloons have signalized the work of previous years, accomplished little if anything new during 1902. In fact, his visit to the United States, with one of his balloons, from which much was expected by enthusiasts in this particular mode of navigating the air, proved for various causes a sad failure, not a single excursion being made. Another serious check was given to the art by the frightful accident to the Severo aerostat in Paris, which resulted in the death of the inventor and his assistant. Despite its tragic conclusion this experiment was in some respects the most noteworthy of any undertaken during the year. In all of the later balloons designed by Santos-Dumont the motor keel has been suspended some distance below the body of the balloon proper. By this construction greater safety from possible ignition of the gas in the balloon by the gasoline motor or from other causes was secured, but it was had at the expense of several disadvantages in the dirigibility of the balloon. Mr. Severo proposed to overcome these disadvantages by propelling the balloon from its axis, by building the driving and stiffening keel within the balloon. The aerostat constructed by him on this principle had the form of an elongated spheroid with a length of 108½ feet, a maximum diameter of 39½ feet, and a capacity of 2200 cubic meters. Two gasoline motors formed the propelling machinery. One motor weighing 220 pounds and developing 16 horse-power was carried on a light bed formed of steel strips at the front end of the keel. The crank shaft was geared by bevel gearing to two vertical rods, one rising to the axis of the balloon where it transmitted power to the horizontal shaft carrying a displacement propeller, and the other driving two vertical fans placed longitudinally underneath the balloon for steering. At the rear end of the keel there was a 24 horse-power motor arranged in exactly the same way for operating the driving propeller, a second pair of steering fans, and a small compensating propeller at the end of the keel. At the trial the aerostat rose to a height of 1500 feet, with all machinery working well, but soon afterwards the propeller was seen to slacken in speed and the aerostat began to drift with the wind. What happened then to cause the accident can never be known, but suddenly a sheet of flame was seen to envelop the balloon and the ruins of the keel fell to the ground with the bodies of the aeronaut and his assistant entangled lifeless in its wreck. On November 2, 1902, an air ship made by Lebaudy Brothers, of Paris, received its first test, when at a height of 60 feet it was propelled against the wind, making, it is stated, a speed of 25 miles per hour. The machine was restrained by a rope from ascending higher. The Lebaudy balloon is similar to the Santos-Dumont, but larger, it being 33 feet in diameter and 193 feet long. The car is 16½ feet long and holds three persons. A 40 horse-power motor drives the propeller. The record of the year for successful flight is, however, due to the air ship of Mr. Stanley Spencer, an English aeronaut which ascended from the Crystal Palace, in London, on September 19, 1902, and made a trip of nearly 30 miles seemingly under perfect control as to direction. This aerostat is 75 feet long, with a blunt nose and tail, and has its propeller in front and is driven by a 30 horse-power motor. It carries only one person.

AFGHANISTAN. A monarchy lying east of Persia and between British India and the central Asian states under British domination. The capital is Kabul.

Area and Population.—The estimated area of Afghanistan, which extends about 600 miles east and west and about 500 miles north and south, is somewhat over 275,000 square miles. The inhabitants, who comprise several races or tribes, number about 4,000,000, most of whom belong to the Suni sect of the Mohammedans.

Government, etc.—At the head of the government, which is loosely organized, is the ameer, an hereditary ruler whose will theoretically is absolute. The ameer in 1902 was Habibullah, who succeeded to the throne upon the death of his father, Abdurrahman, October 1, 1901. The provinces are administered by governors largely through the medium of feudal nobles. Afghanistan, which is practically under British influence, has no foreign relations except with the government of British India. The annual revenue, the amount of which cannot be determined, is

derived mainly from taxation on production, and its collection is attended with dishonesty and extortion. From the Indian government the ameer receives an annual subsidy of 18 lakhs of rupees (\$583,200). The strength of the regular army, which is supplied with arms and ammunition from the factories established by Abdurrahman at Kabul, is estimated at 44,000 men, but in 1902 it was stated that the ameer purposed to increase this number to 80,000.

Industries and Commerce—Considerable attention is given to agriculture and the raising of live-stock. The important products include cereals, lentils, fruits, and asafoetida. These commodities, together with horses and other live-stock, and raw wool, make up the bulk of the exports, which also include a few manufactures such as silk, carpets, and articles made of camels' and goats' hair. The leading imports include cotton goods, dyeing materials, sugar, and tea. No accurate figures are available for the total trade. In the fiscal year 1901 the commerce of Kabul and Kandahar, the principal trade centres, with British India were valued at 5,133,670 rupees in imports and 5,408,310 rupees in exports. (The rupee equals one-fifteenth of a British sovereign, or 32.4 cents.) The total trade with Bokhara is estimated at nearly 8,000,000 rubles (The ruble is worth 51.5 cents.)

History.—The chief characteristic of Afghan affairs in 1902 was uncertainty. Rumors of plots and counterplots in the court and among the nobles were rife, but on the whole it could not be charged that the new ameer showed himself incompetent or, from the eastern standpoint, of bad intent. In February, 1902, unrest at Kabul was fomented by the reported ascendancy in influence over the ameer of the Hadda Mullah, who, it will be remembered, played a considerable part in bringing about the troubles that necessitated the frontier expeditions of 1897. The ameer Abdurrahman kept the power of the mullahs within clearly definite limits, and it was thought that Habibullah's cordiality toward the Hadda Mullah was due to the assistance that he might render in combating the reported designs of Mahommed Ismail upon the Afghan throne. Ismail is the son of Abdurrahman's old opponent Ishak Khan. In order so far as possible, however, to avoid trouble, Habibullah asked the Hadda Mullah to defer his proposed visit to Kabul until after the royal installation on the Afghan New Year's day, about March 20, 1902. The Hadda Mullah, having made his visit and returned to the Indian frontier, in June was removed, together with Mullah Syed Akbar, to Paghman, a town near Kabul, by Habibullah, whose action seemingly sprung from a desire to show friendship to the British government. In the accounts of the court intrigues during 1902, Bibi Halima, mother of Mohammed Umar Khan, a brother of the ameer, was a prominent figure. She opposed, and seemingly had considerable power in her opposition, a number of administrative policies favored by Habibullah. In March it was reported that the troops, having received no pay since the accession of the new ameer, were dissatisfied, but in June he was engaged in bringing about army reform. Besides improving the uniforms and preparing arms and ammunition, he made definite plans for the disposition of the Afghan forces. The border troops were to be kept separate from the regular army, which should comprise 80,000 men.

Although in September, 1902, it was reported that the ameer was giving not a little dissatisfaction to the Indian government, he nevertheless, as seen in the following month, was evidently desirous of maintaining the *status quo* as to foreign relations. It had been reported that in June the ameer regarded with some favor the request of the Russian governor of Tashkent for a Russian representative at Kabul, but in the fall, replying to a Russian communication, he pointed out that Afghanistan may maintain foreign relations only with the Indian government. On October 22, 1902, Lord Cranborne, the British under-secretary for foreign affairs, said in the House of Commons, that in a similar note the Russian government had proposed to Great Britain that direct relations be established between Russia and Afghanistan with regard to frontier matters. Although Russia denied that these relations would have any political character and stated her intention to maintain her foreign engagements and regard Afghanistan as outside the sphere of Russian influence, it was feared in some quarters that she was designing to repeat the intrigues successfully carried out in northeastern Persia.

AFRICA. The area and population of Africa, most of which is unsurveyed and much practically unknown, are necessarily matters of conjecture. Among the latest estimates about 11,500,000 square miles appears for area and about 157,000,000 for population.

Among the more noteworthy events and developments in Africa during 1902 are the following: The end of the Anglo-Boer war, May 30 (see TRANSVAAL); political unrest in Cape Colony; the continued economic progress of Egypt under British administration, the completion of the great Nile dam at Assuan (see DAMS), and the opening of Gordon College at Khartum; the tribal outbreaks in Morocco and finally the attempted overthrow of the sultan; the partly political and partly religious "Senussi" movement, involving Mohammedan natives from Tripoli to

French Central Africa (see FRENCH SOUDAN); the recurrence of insurrectionary movements on the part of the "Mad Mullah" in Somaliland; the administrative reorganization of French West Africa; trouble with the natives in Nigeria and progress in the British organization of that country, advance of the Cape-to-Cairo Railway (*q. v.*) and of the Jiboutil Railway (see SOMALILAND); and continued administrative outrages in the Congo Free State. With varying detail these and many other subjects pertinent to 1902 are treated in the separate articles on the independent countries, the colonies, and the protectorates of Africa.

In the extension of European sovereignty over Africa little apparently was done in 1902 except in the work of establishing actual control in regions already admitted to be within the "sphere" of one power or another. Abyssinia, Liberia, and Morocco maintain their independence. The first named is strong and jealous of her rights; Liberia is weak and unpromising; Morocco, at the end of the year rent with rebellion, is coveted by the French. The most successful dependencies in Africa, as also in other parts of the world, are British; and on the whole the success of the dependencies is real from both the British and the native points of view. In 1902 the extension of British administrative activity was particularly noteworthy in the former Boer republics, the Egyptian Soudan, and Nigeria. Effective French control is steadily working eastward from Senegal and northward from the Guinea colonies and the Congo; indeed, what France is attempting to do in the western and central Soudan is what Great Britain is doing, or in some respects has accomplished, in the Egyptian Soudan. In both regions the European has encountered the courageous and fanatical powers of Islam, whose activities are always a combination of politics and religion. It must be pointed out that while French political influence is undoubtedly advancing in the central and western Soudan so also is Mohammedanism as a religion; Islam is encroaching upon pagan Africa, westward to the coasts of Senegal and Gambia and southward into the French Congo.

Far less successful than the British and French are the German dependencies. In all German Africa there were in 1901 less than 5600 white residents, and no German dependency in Africa, or indeed in any part of the world, is self-supporting. At home the emperor's policy of *koloniale politik* encounters not only popular disfavor but a strong and active opposition in the Reichstag. In 1902 a German anti-colonial organ said: "The government has no other alternative except to sell its African possessions to Great Britain. It is useless to waste any more money on these colonies. Great Britain has tremendous resources and will bring them to play upon its African territory. Germany has no other alternative except to evacuate." But the supporters of the colonial policy "turn their eyes confidently to the Kaiser." Portuguese and Italian progress in Africa is slow, though Italy is striving to increase her influence in Tripoli (Turkish); and Spanish progress is *nil*, though Spain still claims peculiar rights contingent upon any change of the *status quo* in Morocco.

The most conspicuous African explorations in 1902 were in the Somali and Galla regions south of Abyssinia proper and in the regions lying between the basins of the Congo, Lake Tchad, and the Benué. The former were visited by the Austrian traveler, Count Wickenburg, and the latter by a number of French explorers. Lieutenant Kieffer and later Lieutenant Loeffler visited the Shari system, and Loeffler confirmed the existence, rumored since the time of Barth, of the connection, at least in the rainy season, of the Logone with the Benué. The region of the Upper Sanga, a tributary of the Congo, was explored by M. Kerremans, another French official, and a western branch of the Sanga, the Ja, was explored by Baron von Stein, the governor of Southeast Cameroon. A number of boundary lines were run in 1902. An important addition to the knowledge of Africa was made in 1902 by the publication of Sir Harry H. Johnston's comprehensive two-volume work on *The Uganda Protectorate*.

AFRICAN METHODIST EPISCOPAL CHURCH. See COLORED METHODISTS.

AFRICAN METHODIST EPISCOPAL ZION CHURCH. See COLORED METHODISTS.

AGRICULTURE. Agriculture shared the general prosperity of the country during 1902. The production of most of the staple crops was enormous, new records being made in the case of several crops. This was true, although the season in many parts of the country was abnormal, the excessive rains during summer, in place of the drought of the previous summer, being quite unfavorable to some crops. The corn crop, which was unusually poor in 1901, amounted to two and a half billion bushels, one of the very largest on record. The quality, however, was poor in restricted sections, owing to the rainy season. While the production of wheat was less than in 1901, which was a record year, it was much above the average and

ceeded the record crop of 1901 by 25 million bushels and was nearly double the average for several years past. The permanent damage to the oat crop from the heavy rains during the period of growth was less than anticipated, the main effect being apparent in the quality. The crops of hay and of potatoes were among the very largest recorded, the average yield of hay per acre being unusually heavy. (See the articles on the various crops.) The total farm value of the cereal crops of 1902, as estimated by the United States Department of Agriculture, was \$1,821,805,745. The addition to this of the estimated value of the other staple crops (potatoes, hay, tobacco, buckwheat, and flaxseed) gives a total of \$2,617,895,416, exclusive of the cotton crop of 10,417,000 bales, which would bring the estimated value of the leading farm crops well up toward three billion dollars. The census of 1900 makes the aggregate value of farm products (animal and vegetable) five billion dollars, an increase of two billion in the decade. The terrible drought in Australia which has lasted for over four years has operated favorably on American export trade. Not only has the Australian wheat trade in Asia fallen into American hands, but Australia itself has been compelled to buy wheat from the United States. As a result wheat sold in San Francisco at the close of 1902 at a higher price than at any time within the past four years, and for some months it had not been necessary to consign a single cargo to Liverpool, making the Pacific coast wheat grower independent of the Liverpool market.

The year 1902 was a prosperous one for live-stock and dairy interests as well. The prices for cattle and hogs were unusually good for the most part, and milch cows were in demand at high figures. The prices for beef reached a higher level in the early summer than for twenty years. Steers sold for \$8 to \$8.75 a hundred pounds. The close of the year, however, found the Chicago market glutted with cattle, and prices ruled very low. The value of the exports of animals and animal products for the year ended June 30, 1902, amounted to the large sum of \$244,733,062. There was an increase of about three million dollars in the amount of animal products exported, but the value of the cattle shipped decreased nearly eight million dollars, due to the sharp demand for beef cattle at home. Our total agricultural exports for the year ended June 30, 1902, had a value of about \$860,000,000, and our agricultural imports amounted to \$410,000,000. The number and value of farm animals in the United States on January 1, 1903, as compared with the same date in 1902, is thus stated by the statistician of the United States Department of Agriculture:

	Number.	Ave. price per head.	Value.
HORSES.			
1903	16,557,373	\$62.25	\$1,030,705,950
1902.....	16,531,224	58.61	968,935,178
MULES.

Plant Production.—One of the most noteworthy features of the work in plant production is the attempt to improve cultivated fruits and crops by systematic plant breeding. All our common fruits and agricultural plants have been brought to their present stage of perfection by selection and cross-breeding. While this has long been practiced by seedsmen and others, much interest has been aroused in recent years in conducting such work on a scientific basis and with a definite aim. In some cases the object sought is a strain or variety of greater resistance to drought or cold, or some specific disease, in others one of shorter growing period or greater productiveness or greater richness in composition. The work is of great variety and is being prosecuted enthusiastically by a large number of workers in this country and in

Europe. The large interest in this subject was shown by an International Congress of Plant Breeding and Hybridization, the second of its kind, which was held in New York City at the end of September, 1902. About eighty delegates were in attendance, including several from Canada and abroad. A long programme of papers was presented which dealt with the principles of plant breeding and their application, and reported the results attained in various lines. The fundamental principles underlying plant selection and breeding, and the fixation of desirable qualities, are but imperfectly understood as yet, so that the element of chance enters largely into the work and retards progress. Some very valuable results have already been obtained in this country with a number of crops, and the systematic work that is being carried on by the United States Department of Agriculture and many of the agricultural experiment stations promises much for agriculture and horticulture, in providing varieties of special adaptation to locality and purpose.

The search for new plants and varieties better adapted to particular sections of the country, and the introduction of old plants into new sections, go steadily on with encouraging progress. Macaroni wheat has become an established crop in the drier regions of the Northwest, and yields from one-third to one-half more than the other standard wheats in the same localities. It is estimated that about two million bushels were harvested in the season of 1902, an amount that is inadequate to meet the increasing demand. The growth of emmer or spelt, a grain somewhat like barley, is extending in the semi-arid regions. It is grown in Europe where corn cannot be raised, and is used principally as a feed for sheep, pigs, and other farm animals. It is hardy and resists drought and hot summers. The results with it experimentally have been encouraging, and its growth as a forage crop in regions to which it is adapted is extending. Such leguminous crops as alfalfa, cowpea, and soy bean are spreading more widely every year, and are being grown in the East to save buying such large quantities of expensive feeding stuffs. In Delaware it has been shown that maximum crops of alfalfa yield an amount of protein per acre equivalent to that in one and a half tons of cotton-seed meal, and that a crop of crimson clover and of cowpeas, which could be grown on the same piece of ground during the season, would produce an equal amount. The New Jersey Experiment Station found that alfalfa hay and crimson clover hay each took the place of the grain ration for much cows, and resulted in a considerable saving in cost, showing the practical way in which, under a system of intensive farming such as is followed at the station farm, leguminous crops may be used to take the place of purchased feeds. The Illinois Experiment Station has shown that the bacteria necessary to enable alfalfa to assimilate the nitrogen of the air are usually lacking in the soils of that State, and that even the rich black prairie soil does not contain sufficient nitrogen for maximum crops of alfalfa. The application of nitrogenous fertilizer increased the yield of alfalfa hay from two to four times, and inoculation of the soil with the proper bacteria gave equally as large crops as the use of fertilizers. In the South the velvet bean is being widely introduced as a forage and renovating crop. It makes a luxuriant growth, covering the ground with a heavy mass of vines, leaves, and pods. The vines may be either pastured, cut and fed green, or cut and made into hay. The beans may be ground and fed as a grain ration. All parts of the plant make rich feed and are much relished by animals. The stubble and roots enrich the soil and improve its physical condition. This increasing growth of numerous kinds of leguminous plants is a most important step in the direction of better farming, resulting in the production of larger amounts of feed on the farm, and in increasing the fertility of the land. Aside from the saving in expense for concentrated feeds, it is also relieving the farmer of a portion of the expense for commercial fertilizers, which is a heavy burden in many sections and especially in the South.

Cassava is another crop that has been tried in the South experimentally, and is now being grown to an increasing extent in the Gulf States as a fodder crop. It is raised as a root crop, giving an enormous yield of starchy tubers which are relished by cattle and hogs; and, supplemented with velvet bean, is said to produce beef of excellent flavor, economically. A new method for preserving sweet potatoes has been worked out and tested at the South Carolina Experiment Station, which consists essentially in boiling the tubers before evaporating them. The evaporated product will keep indefinitely and bear transportation to any part of the world at any season. Several varieties yielded from 3000 to 5000 pounds to the evaporated product per acre. Hemp growing is being undertaken in Nebraska, where a new and important step has been taken in cutting the crop with an ordinary mowing machine. A simple attachment, which bends the stalks over in the direction in which the machine is going, facilitates the cutting. The cost of cutting hemp in this manner is 50 cents per acre, as compared with \$3 to \$4 per acre, the rates paid for cutting by hand in Kentucky, where more than nine-tenths of the hemp produced in the United States is now grown. By the methods that can be practiced in Nebraska,

hemp tow, it is said, can be produced nearly equal in value to Kentucky rough hemp, and at a total cost, exclusive of rent of land, of about \$20, instead of \$45, per ton.

There was a considerable extension of sugar beet culture in this country in 1902, the estimated area being 259,513 acres, against 137,925 in 1901 and 132,000 in 1900. The most notable increases were in Michigan, California, Colorado, and Utah, which are credited with about 88 per cent. of the aggregate acreage, Michigan leading California in that respect. The production of beet sugar for 1902-03 is estimated by Willett and Gray at 195,800 tons, which, with the production of sugar from cane (250,000 tons) gives a total of 445,800 tons, an amount equal to about 17 1-2 per cent. of the total sugar consumption of the United States. See SUGAR INDUSTRY.

The growth of Sumatra tobacco under shade in the Connecticut Valley greatly increased during 1902, about 700 acres being grown in this manner in that season, as compared with a total of less than 40 acres the preceding year. The season was quite unfavorable to tobacco in New England, owing to the unprecedented rainfall and the unusually severe wind and hailstorms; but the crop under cover was apparently not injured, and the quality is said to be better than in the previous year. It is estimated that the yield of cured Sumatra tobacco will be about 1,000,000 pounds; and the success of the industry is considered assured.

Considerable interest has been aroused among the grape growers of Austria, Italy, France, and a number of adjoining countries, in a method for protecting crops against hail by means of cannonading. The method consists essentially in sending up vortex rings of smoke and air toward approaching hail clouds, by means of explosives in cannon of special construction. Those who have actually put the method into operation testify with remarkable unanimity as to its effectiveness, the loss from hail being declared much less than before the system of cannonading was introduced. The most systematic organization of cannonading stations is found at Denicé, where 52 cannon, covering an area of 2500 acres, are operated. The movement has attained great importance among practical men, and the installation of the system is rapidly extending, especially in the grape-growing regions of Europe. The idea has been scouted by some scientific men, while others, although unable to explain the action, are impressed with the practical results. An international congress of those interested in the subject was held at Vienna, Austria, in the autumn of 1902, under scientific auspices.

Animal Production.—The year 1902 witnessed a further passing of the scrub and an increased appreciation of well-bred stock. A considerable percentage of farmers hitherto unconvinced of the pecuniary advantage of using good blood in producing market stock have been converted, and purchased pure-bred bulls. On the range there was an evident movement in the direction of better-bred animals such as the market demands; and this, coupled with the shortage of corn, the drought in some sections, and other influences, forced upon the market an unusual number of poorly-bred and inferior cattle. This interest in better stock is evidenced by the auction sales of pedigreed beef cattle during 1902, which amounted to more than two and a half million dollars, an increase of nearly three-quarters of a million over 1901, and by the large private sales. The prices were a matter of much satisfaction to breeders. At 26 auction sales in Chicago, 1789 head of pure-bred cattle were sold at an aggregate sum of \$611,876, a general average of \$342 each. Among the sensational sales of the year was that of the Hereford bulls Crusader and Perfection at \$10,000 and \$9000, respectively; the cow Dolly 2d, of the same breed, for \$7000; the imported Aberdeen-Angus bull Prince Ito at \$9100, and a yearling heifer of the same breed for \$6300. Many more Shorthorns were sold than of any other breed, and these brought a general average of \$260 each, being only exceeded by the Herefords at \$265. The report of the Union Stock Yards at Chicago shows a remarkably heavy year, the total valuation of the stock received reaching the stupendous sum of \$312,884,386, over 30 million dollars more than in 1901, and 50 millions more than in 1900. These receipts included nearly three million head of cattle, 250,000 calves, about eight million hogs, four and one-half million sheep (a large increase), and over 100,000 horses. At both the Kansas City and Omaha stock yards, the receipts of cattle, calves, and sheep were the largest ever recorded for those places.

The question of how to produce beef more economically is one of the most vital importance to the Middle West. The advance in value of farm lands, the competition of the range country, and the higher price of corn and other feeding stuffs have materially changed conditions; and it is often questioned whether the feeder can hope to realize a profit from feeding corn at 55 or 60 cents a bushel. One of the most extensive and valuable experiments bearing on this point ever made was carried on in 1902 by the Iowa Experiment Station, in cooperation with a large stock feeder at the Brookmont Farms, comprising over 7000 acres. Eleven lots of twenty steers each were fed corn, with a variety of other feeds added, and finished for the market. The price received ranged from \$7 to \$7.65 per hundred. The largest net profits per steer, \$17.60 and \$18, were made on rations of corn with

gluten meal or feed, and these lots gave the best results in the slaughter test. The price received for the corn which was fed to the different lots ranged all the way from 70 cents to \$1.04 per bushel, 93 cents being realized when the corn was fed without other grain. The results show that with proper management there are good profits in feeding corn at the prices received for the steers; and that the selection of feeds to be given with the corn is a most important one.

The leading live-stock event of 1902 was the third International Live-Stock Exposition, held at Chicago, November 29 to December 6, inclusive. It surpassed its predecessors in magnitude and in the character of the exhibits. The educational value of these shows is very great, and they attract very large numbers of persons interested in various kinds of stock, who study the progress in animal breeding as exhibited by the specimens of pedigreed animals presented and follow the work of the judges. The Aberdeen-Angus cattle were the leaders at the fat stock show, whereas in 1901 it was the Herefords. Never has a breed accomplished such sweeping victories at a fat-stock show. Two out of three of the breed championships by ages, the grand championship of the show, the grand champion herd and reserve for the herd, fell to the blacks, and the carload lots made almost as sweeping a victory. In the slaughter test, five of the ten prizes for carcasses fell to the blacks, including the championship. Several of the agricultural colleges made fine showings. The Iowa Agricultural College carried off the grand championship of the fat-stock show, and the herd championship, with its Aberdeen-Angus cattle. The showing of carload lots of beef animals surpassed any previous display, no less than 120 carload lots of fancy-fed cattle competing. There was also an unusually fine showing of sheep; but the horses proved the most attractive feature of the exhibition. There was an enormous exhibit of Percherons, and a fair one of Shires and Clydesdales. The contest of draft horses was extraordinary, and evoked the keenest interest. The show called attention again to the merits of the dairy-bred steer for beef, which have also been brought out in trials at several of the experiment stations. These combined results have shown that the dairy-bred steer may profitably be turned to beef, and in many cases makes a very creditable showing as a beef animal. In the slaughter test at the show a Jersey steer three years old occupied fourth place among seventeen animals slaughtered, all the others being of recognized beef type. The present discrimination of the market against the dairy-bred steer is regarded by many as unjust.

A noteworthy event of the year 1902 was an outbreak of the foot-and-mouth disease among cattle in New England during the fall. This disease is quite common in Europe, but has seldom occurred in this country. It is extremely contagious and on this account especially is much feared. It is characterized by eruptions of ulcers or blisters in the mouth, upon the heels, or between the toes, and upon the teats or udder. The appetite is depressed, the milk-flow diminishes, the animal loses condition and becomes lame. After a day or two the ulcers break, peel off, and leave a raw surface that may heal in a few days, or, especially upon the feet and teats, may remain sore for a long time and lead to serious complications. The death-rate is very low, but the disease attacks the whole herd, and many animals are seriously damaged, so that the loss to a herd owner is heavy. A strict quarantine was established, and Congress promptly made an emergency appropriation of \$500,000 to check the outbreak. This work was in the hands of the Bureau of Animal Industry of the United States Department of Agriculture, assisted by local authorities. Some 2500 head of cattle were killed, the owners of which received an indemnity amounting to 70 per cent. of their appraised value. The disease was brought under control by the close of the year, and infected premises were then thoroughly disinfected and in some cases burned. It is thought possible entirely to stamp it out, as the area of infection was quite restricted and the prompt action prevented its spread.

A most important discovery bearing on the relation of human and bovine tuberculosis was reported during 1902. It has resulted in a method for immunizing cattle to tuberculosis by means of a vaccine prepared from the sputum of human consumptive patients. The disease in man and cattle is usually held to be due to the same organism, but the bacillus from man is less virulent in its action on animals than that from cattle. Dr. von Behring of Marburg, Germany, announces that cattle passing through the mild attack induced by the human tubercle bacilli are thereafter immune to bovine tuberculosis. Experiments in immunizing cattle have been carried on by him for five years, and have shown the best methods of preparing and administering the vaccine. The immunization has held for a number of years, and Dr. von Behring believes the method as worked out by him is entirely practical. Similar, but less extensive, results have more recently been announced by Dr. Pearson, of Philadelphia. The method of immunizing cattle to this dread disease, if the expectations of the authors are realized, offers a practical means of controlling its ravages

in animals and constitutes one of the most important discoveries in animal pathology.

Agriculture in the Philippines.—In the report for 1902 of the United States Philippine Commission, Dean C Worcester, secretary of the interior, reviews the present state of agriculture in the islands and outlines some of the opportunities for development. Up to the present time agriculture has been carried on in a very primitive fashion, with rude implements and antiquated machinery, and without the use of fertilizers or the employment of suitable methods of cultivation and management. The results that have been obtained under such conditions afford proof of the favorable character of the climate and the natural richness of the soil. Only a small part of the soil suited to the production of sugar, hemp, and tobacco on a large scale is at present under cultivation. The method of extracting sugar leaves approximately 50 per cent. of the sugar in the pressed cane, and hemp is cultivated in a haphazard way, where it is not allowed to grow practically wild. Though the fibre is extracted by hand, hemp constitutes 62½ per cent. of the total exports of the island. No systematic and sustained effort has ever been made to improve the quality of Philippine tobacco, and the methods of curing it are very primitive. There are large areas of Government lands admirably suited to the cultivation of coconuts, and the demand for copra (dried coconut meat) and coconut oil exceeds the supply. At present there is no true cacao plantation in the archipelago, and the methods practiced are very primitive and wasteful. The cacao now produced in the island of Mindanao is of superior quality and brings an especially high price. There are thought to be unusually fine opportunities for developing the culture of this crop, and also of vanilla in numerous regions. With the exception of the mango, the fruits of the region have been practically neglected in the past, although the conditions of the soil and climate are generally adapted to the growth of bananas and pineapples, and, in selected localities, oranges and other citrus fruits. An especially fine coffee is grown in the mountain regions of Benguet and Bontoc and in the province of Lepanto. The bushes yield heavy crops, and the unhulled coffee at present sells readily in Manila at 35 dollars (Mexican) per cavan (nearly three bushels). Coffee bushes come to bearing in Benguet in three years. The secretary says: "There is no region in the United States which has a more healthful or delightful climate than is afforded by the Benguet highlands, where a white man can perform heavy field labor without excessive fatigue or injury to his health." One of the greatest drawbacks to agriculture in the Philippines at present is the lack of draft animals. Rinderpest has been very prevalent among the carabao (water buffalo) and cattle, and surra among horses. The supply of these animals is so short in some sections that farm work has been entirely abandoned. Efforts are being made through the provincial governments to restock the islands with draft animals, and the Serum Institute is turning out an anti-rinderpestic serum in large quantities. The production of milk and beef offer great opportunities for profitable development, provided disease can be controlled. Milk is very scarce and dear in Manila, and native beef cattle are very high. Fresh meat to the value of over \$600,000 a year is being imported into Manila, exclusive of that used by the army and navy. There are excellent ranges for cattle and a great variety of fodder plants which grow luxuriantly. The secretary is confident that properly conducted cattle ranches would yield very large returns.

UNITED STATES DEPARTMENT OF AGRICULTURE.

Owing to increased financial resources, the work of the department was materially enlarged during 1902. Its efficiency was also increased by the partial reorganization effected during the year, which involved the establishment of the bureaus of plant industry, soils, chemistry, and forestry, and the rearrangement of the work of the office of experiment stations on the same basis as that of the bureaus. The annual appropriation for the department for the fiscal year ending June 30, 1903, is \$4,503,960 (as compared with \$3,862,420 the previous year), exclusive of the regular appropriation of \$720,000 for the State agricultural experiment stations. On July 1, 1902, the number of its paid employees was 3789, of whom 2081 were classed as scientists and scientific assistants. During the fiscal year 1902 it issued 757 publications, aggregating 10,586,580 copies, of which 6,150,000 copies were *Farmers' Bulletins*. It is estimated that the cost of printing and transporting these publications was about \$1,000,000. Among the important features of the work of the department during 1902 are the following: The Weather Bureau extended the distribution of daily forecasts through the rural mail delivery as far as its funds would permit, and continued experiments in wireless telegraphy with a good degree of success. Antemortem inspection of animals by the Bureau of Animal Industry aggregated nearly 60,000,000 animals, and the meat inspection stamp was affixed to over 23,000,000 packages of meat products. An inspection of dairy products offered for export was inaugurated under an act of Congress, passed March 20, 1902. Over 1,500,000

doses of black-leg vaccine were distributed during the year, and reports show that its use reduced the loss of cattle to 0.51 per cent. of those vaccinated. Near the end of the year, as stated above, the bureau was active in preventing the spread of the foot-and-mouth disease in New England. Special efforts were made by the Bureau of Plant Industry to extend the exports of fruits and vegetables. Important practical results were obtained from studies of pear blight and the 'little peach' disease. The development of a variety of cotton resistant to wilt disease is now believed to be an assured fact, and a variety of cowpea was discovered resistant to wilt and to root knot. Several varieties of long staple cotton of good quality and productiveness were produced, and it is believed that these can be made permanent. A simple, cheap and satisfactory method of growing and distributing root-tubercle bacteria for all the important leguminous crops was perfected. Encouraging success was attained in efforts to extend the growth of alfalfa in the Northern States, where a substitute for clover is desired. Successful efforts were made to reduce the cost of tea production on the experimental plantations at Summerville, S. C., and better grades of tea were produced by improved factory methods. Nine thousand pounds of commercial tea were produced, most of which ranks with the high-grade imported kinds. The success of the experiments with macaroni wheat has already been mentioned. Extensive experiments were inaugurated to determine the best methods of fruit storage, and methods were discovered by which the injury through 'scald' in storage may be materially lessened. Agricultural explorations were continued in India, China, Japan, and other countries. Among the valuable recent introductions are hardy Russian varieties of winter wheat, Egyptian or berseem clover, and the Jordan almond. The Bureau of Forestry furnished working plans for nearly 400,000 acres of private lands, and has become the official adviser of the secretary of the interior in matters of forest policy for the national forest reserves covering over 60,000,000 acres (see FORESTRY). A less injurious method of turpentine orcharding than that hitherto employed was discovered. The Bureau of Soils surveyed and mapped during 1902 over 14,500 square miles, or about 10,000,000 acres. Over 14,500,000 acres have been surveyed in all, the work having been done in twenty-five States and Territories and in Porto Rico, at a total cost of less than \$3 per square mile. The methods of analyzing soils in the field have been perfected. The continued success of the experiments in growing Sumatra tobacco under shade has already been mentioned. The Bureau of Chemistry continued the study of adulterated foods and undertook an elaborate investigation to determine the effect of borax and other preservatives on the nutritive value and healthfulness of foods by digestion experiments with human subjects. The Division of Entomology studied the San José scale in Japan and China, with special reference to the importation of its ladybird enemy. Other important investigations were those on the Mexican cotton-boll weevil, codling moth, and forest insects. The culture of the Smyrna fig in California with the aid of the fig-fertilizing insect, has proved successful. Silk culture is again being systematically investigated. Work under the Lacey act, for the protection and preservation of game, was continued by the Biological Survey. Studies on the nutritive value of cereals, meats, and fruits, and experiments with men in the Atwater-Rosa respiration calorimeter, with special reference to the relation of diet to muscular energy, were continued by the Office of Experiment Stations. The same office enlarged its studies on irrigation. (See IRRIGATION.) It also began investigations on drainage, the use of various kinds of power in agriculture, farm machinery and other subjects included in agricultural engineering. The Office of Road Inquiry was active in its propaganda to stimulate public interest in the building of good roads in different parts of the country.

AGRICULTURAL EDUCATION.

The most important feature in the progress of agricultural education in the United States during 1902 was the successful institution of a graduate school of agriculture, which held its first session during July at Columbus, O., under the auspices of the Ohio State University and in cooperation with the United States Department of Agriculture and the Association of American Agricultural Colleges and Experiment Stations. Dr. A. C. True, director of the United States Office of Experiment Stations, was made dean of the faculty, which consisted of thirty-five instructors, of whom twenty-six are professors in agricultural colleges, seven are leading officers of the Department of Agriculture, and two are officers of the New York State Experiment Station. The seventy-five students drawn from twenty-eight States and Territories included twenty-seven professors or assistant professors in agricultural colleges, and thirty-one assistants in colleges or experiment stations. Courses were given in agronomy, zootechny, dairying, and breeding of plants and animals, and conferences were held on important topics connected with the more definite formulation of the science of agriculture and agricultural pedagogics. It is believed that the influence of this school will be felt throughout our whole system of

agricultural education and research, and it is hoped to make it a permanent feature of the American system of education in agriculture.

Among the agricultural colleges there was considerable progress during 1902 in strengthening and specializing the courses in agriculture. At the University of Illinois the College of Agriculture has a faculty of twenty-six instructors and investigators in agronomy, horticulture, zootechny, dairying, and veterinary science, and there are special courses in farm machinery, drainage, soil bacteriology, breeding, etc. The Minnesota College has added a new line of work—instruction and laboratory exercises in cutting and curing meat. Courses in agricultural economics have been given at the University of Wisconsin and in rural sociology at the University of Michigan. College extension work, largely through correspondence courses, is receiving increased attention at the agricultural colleges. These institutions are also issuing a constantly increasing number of popular bulletins, press bulletins, leaflets and periodicals. The State legislatures meeting in 1902 made unusually liberal appropriations for maintenance and new buildings at these colleges. Universities and colleges receiving the benefits of the acts of Congress of July 1, 1862, and August 30, 1890, are in operation in all the States and Territories, except Alaska, Hawaii, and Porto Rico. The total number of colleges maintaining courses in agriculture is sixty-three; the aggregate value of the permanent funds and equipment of the land-grant institutions in 1902 was \$67,544,888, of which \$3,484,200 was added in 1902; their income was \$9,166,272. Out of a total attendance of 46,699 students, 6299 were in courses in agriculture.

Interest in the movement for the establishment of secondary agricultural schools and courses continues to increase. In Wisconsin the law passed by the legislature in 1901, authorizing county boards "to appropriate money for the organization, equipment and maintenance of county schools of agriculture and domestic science," has already borne substantial fruit. Two schools, established under this act, opened their doors to students in October, 1902. One is located at Menomonie in Dunn County. It is equipped with a substantial brick main building, erected by the county for the joint use of this school and the county teachers' training school, and a frame building for shopwork, which with the grounds surrounding the school cost \$5,000. The farm work is done on the county asylum farm, one mile away. The regular course of farm study occupies two years, and, besides many of the subjects ordinarily pursued in high schools, includes the following: For boys—soils, fertilizers, plant life, horticulture, field crops, animal husbandry, dairying, poultry, economic insects, farm accounts, blacksmithing and other metal work, carpentry and rural architecture; for girls—sewing, cooking, home economy and management, drawing, domestic hygiene, chemistry of foods, dairying, poultry, farm accounts, and horticulture. About fifty students were in attendance at the first session, coming with few exceptions from the country schools. The other agricultural school is located at Wausau in Marathon County. The buildings and equipment for this school cost \$20,000, and the school grounds cover six acres. Over sixty students are in attendance.

The agricultural high schools connected with the agricultural colleges in Minnesota and Nebraska continue to be largely attended. At Winona Lake, Ind., an agricultural and technical institute of high school grade has been opened, and at Groton, Mass., a school of horticulture and landscape gardening for women has been established. The Briarcliff School of Practical Agriculture and Horticulture has been moved to a farm of 415 acres near Poughkeepsie, N. Y. Instruction in agriculture was given in the three normal schools of Missouri in 1902 to about 300 students. Practical courses in agriculture are being given with increased efficiency in a number of institutions for negroes in the Southern States, notably at Hampton, Va., and Tuskegee, Ala. The course of study for the Indian schools conducted by the United States government has been changed to include the teaching of the theory and practice of agriculture in all the grades. The committee on methods of teaching agriculture of the Association of American Agricultural Colleges has published a report (Circular 49, U. S. Office of Experiment Stations), in which tentative agricultural courses for the public high schools are outlined.

Marked progress has been made in the movement for the consolidation of the rural common schools, and along with this there is much agitation for the introduction of simple lessons on agricultural subjects in these schools whenever the employment of competent teachers makes it possible to enrich the course of study. School gardens are being established in many places, but more especially in towns and cities. The United States Department of Agriculture is making a special distribution of seeds for such gardens. The University of Illinois has organized a number of young people's clubs to cooperate with the college of agriculture in various lines of agricultural practice and experimentation. In 1902 these clubs tested seed corn and growing corn or flowers, in competition for premiums. The records of these tests are sent to the college for tabulation and report.

Farmers' institutes were held during 1902 in forty-four States and Territories,

including Hawaii. In all, about 2700 institutes were held, with a total attendance of about 800,000 persons. A successful meeting of the American Association of Farmers' Institute Workers was held at Washington, D. C., in June, 1902, the proceedings of which were published by the Department of Agriculture. A central agency for the promotion of the interests of the Institutes has been established in the United States Office of Experiment Stations.

AGRICULTURAL EXPERIMENT STATIONS.

The Office of Experiment Stations published in 1902 a bulletin containing accounts of about 720 agricultural experiment stations, and kindred institutions in fifty countries outside of the United States. This demonstration of the world-wide extent of the experiment station movement is especially interesting in view of the fact that during the same year the station at Moeckern, Germany, which was the first regularly organized under government auspices, celebrated the fiftieth anniversary of its foundation. These scientific agencies for the promotion of agriculture, which for the most part are government institutions, are now in operation in every country of Europe except Greece and Turkey. In Asia there are stations in Russian territory and in Japan and British India. Africa has a rather large number in the British, French, and German colonies. In South America there are stations in Brazil, Argentina, Chile, Paraguay, and British Guiana. There are none in Mexico or in Central America, except in British Honduras, where a botanic garden is located. Canada, Australia, New Zealand, and the British West Indies, have a considerable number of stations. The United States has sixty stations, including those recently established in Alaska, Hawaii, and Porto Rico. The largest number of separate agencies for experimentation in agriculture are found in Russia, where there are over 100 such establishments. Many of these, however, consist chiefly of small demonstration fields, for the instruction of the peasants or the introduction of new agricultural industries. Germany has eighty stations, France seventy-one, Austria forty-one, Sweden twenty-six, Belgium fifteen, but in all these countries the work of a number of the stations is confined to the control of fertilizers, seeds, etc. In the British Isles there are twelve institutions that may be regarded as experiment stations, seven botanic gardens, and ten other institutions that conduct some agricultural experiments.

The Department of Agriculture and Technical Instruction for Ireland, organized under the act of Parliament of 1899, has begun to issue reports of its operations. These show that, in addition to a variety of duties pertaining to technical education, lands, fisheries, control of animal diseases, etc., the department is directly promoting education and research in agriculture, largely in cooperation with the different counties and boroughs. In England the Aynsme Agricultural Experiment Station has recently been established at Grange-over-Sands as a private enterprise. Other new enterprises are the seed-control station for forest seeds at Eberswalde, Prussia; an agricultural experiment station at Augustenberg, formed by the union of the chemical and botanical stations formerly located at Karlsruhe; a dairy station at Gembloux, Belgium; and an agricultural physiological station at Prague, Austria. The initial number of a year book summarizing the work of the Russian experiment stations has been issued by the ministry of agriculture and imperial domains of that country; and the British imperial department of agriculture for the West Indies has begun the publication of a fortnightly review, entitled *Agricultural News*.

In the United States during 1902 the sixty stations employed 710 persons in the work of administration and inquiry, of whom 344 did more or less teaching in the agricultural colleges. The total income of the stations was \$1,328,847, of which \$720,000 was received from the national government and \$608,847 from State governments, fertilizer analysis fees, sales of farm products, etc. In addition, the Office of Experiment Stations had appropriations from Congress amounting to \$139,000. The value of additions to the permanent equipment of the stations in 1902 is estimated at \$262,829, including \$175,763 for buildings. The station in Porto Rico has been permanently located at Mayaguez, on a farm of 235 acres, purchased with funds granted by the insular government and the municipality of Mayaguez. A new station has been established in the Copper River region in Alaska, where there are large tracts of land believed to be suitable for agriculture. The Kansas Experiment Station has recently come into possession of 3500 acres of the Fort Hays Reservation, and has established there a sub-station, supported by State funds. In a similar way new sub-stations have been established at Troupe, Tex., and McNeill, Miss. An interesting enterprise of a novel character is the experiment station conducted by the company publishing the *Agricultural Epitomist*, on a farm of 500 acres near Spencer, Ind. Evidences of the influence of station work in improving the agricultural practice of the country continue to multiply. A few examples, selected from a large number recently collated by the Department of Agriculture, may serve to illustrate the importance of these research institutions as factors in the economic progress

of the United States. The origination and introduction of improved varieties of cereals through the agency of the stations in the chief grain-growing regions, co-operating with the department, is resulting in a great increase in the grain-producing capacity of this country. For instance, a single variety of oats, imported by the department and improved by the Wisconsin Station, has been widely distributed, with results which indicate that its general introduction will be followed by an average increase of yield amounting to from three to five bushels per acre. One of the results of the successful work of the Illinois Station in breeding corn so as to vary its content of protein, oil, and starch, according to the requirements of different industries, has led to the formation of the Illinois Seed Corn Breeders' Association, pledged to select and grow their seed corn according to definite rules formulated by the station, and thus far the demand for these improved varieties of corn has far outrun the supply. The influence of the station investigations is also being widely shown in the grain-growing region by the introduction of rotations of crops, to conserve soil fertility, a matter of immense economic importance, in view of the rapid depletion of the soils of that region through the continuous grain cropping heretofore generally practiced. The beneficial effects of the work of the stations in the older States on fertilizers are every year becoming more apparent, as shown in the economical purchase and intelligent use of fertilizers by farmers. The home mixing of fertilizers in accordance with instructions issued by the stations is becoming an important factor of progress in this line. The recent introduction of the inspection of feeding stuffs under station auspices is proving an effective means of protecting farmers against fraud, and is increasing their attention to the economical purchase of concentrated feeds and the balancing of rations with the cheaper home-grown products. The rapid extension of the use of silage and the very general adoption of the round silo are directly traceable to experiment station influence. Through the efforts of the department and the stations, the application of insecticides and fungicides, as means of protection against injurious insects and plant diseases, has become general, and the benefits and profits resulting from this practice are no longer questioned by intelligent farmers. In Wisconsin, for example, a method of formaldehyde treatment of oat smut, proposed by one of the stations, was almost immediately put into use by over 25,000 farmers in that State alone. The demonstration by the Utah station that certain lands lying above the irrigation ditches could, by careful methods of tillage, be made to produce crops without irrigation, has led to a system of 'dry farming' on large tracts formerly regarded as fit only for grazing and this, together with the studies now being made by the stations in the West and in the Office of Experiment Stations regarding the amounts of water actually required by various crops, will be an important factor in the agricultural development of the arid region.

The first report of the Bureau of Agriculture of the Philippine Islands has recently been published by the War Department at Washington. The bureau is under the direct management of Prof. F. Lamson-Scribner, formerly agrostologist of the United States Department of Agriculture. With him are associated experts in botany, soils, plant culture and breeding, farm machinery and farm management, fibres and tropical agriculture, and investigations along these lines have been begun. Seed distribution has been undertaken, and a station for the testing of seeds and the growing of introduced plants and trees, has been established at Manila. Experiments with cocoanuts, abacá, manila hemp and cacao have been undertaken at San Ramón farm, in the district of Zamboanga, Mindanao, with a view to demonstrating that the island lands may be profitably used for growing staple crops. In co-operation with General Bell in Batangas province, demonstration experiments are being made in the use of American machinery and farm methods for the growth of alfalfa, teosinte, cotton, tobacco, sugar, and other staple crops. At Bagnio, preliminary experiments with American vegetables are being made with reference to the desirability of establishing a station there, since the climate is said to be suited to a great variety of tropical, sub-tropical, and temperate zone plants. An experiment station for rice will be established near the centre of the great rice-producing region, extending from Manila to Dagupan. The publication of bulletins in both English and Spanish has been begun.

AIR-SHIP. See **AERIAL NAVIGATION.**

ALABAMA, one of the Gulf States of the United States, has an area of 52,250 square miles. The capital is Montgomery. Alabama was organized as a territory March 3, 1817, and admitted as a State, December 14, 1819. The population in 1900 was 1,828,697, while in June, 1902, as estimated by the government actuary, it was 1,894,000. The population of the three largest cities in 1900 was: Mobile, 38,469; Birmingham, 38,415; Montgomery, 30,346.

Finance.—The balance in the treasury, at the close of the fiscal year ending September 30, 1901, was \$501,359.30. The receipts for the fiscal year 1902 were \$2,908,-

714.37, and the disbursements \$2,680,721 81, leaving a balance of \$729,351.86. The main items of revenue and the amounts derived therefrom were: State taxes of 1901, \$2,171,680.46; other State taxes of former years, \$259,638 81; solicitors' fees, \$39,277.92; insurance fees, \$66,981.48; a privilege tax on express, telegraph, and sleeping car companies, \$11,339.32; from the secretary of state, \$161,367 53, license fees on railway companies, \$12,205.14; and from the hiring out and earnings of convicts, \$194,412 58. As the cost of maintaining the convict department was only \$94,388.12, a balance of \$100,024.46 remained, applicable in accordance with a legislative act of 1901 to the uses of the State treasury. At the end of the year, the bonded debt of Alabama was \$9,357,600, bearing annual interest of \$148,680.

Agriculture and Industries.—This State, known as the "Cotton State," showed during 1902 a greater development in its manufacturing, mining, and commercial industries, than in the production of cotton and other agricultural products. The cotton crop, however, with apparently poor prospects, reached a production estimated at 1,200,000 bales, as compared with 1,078,000 in 1901. The acreage of corn was 2,764,717, with a total production of 23,233,623 bushels. Oats at 109 bushels per acre, amounted to 2,320,141 bushels, being about 80 per cent. of the average crop. The Department of Agriculture estimated the value of the State's farm animals on January 1, 1903, as follows: Cattle, \$7,347,670; sheep, \$330,558; swine, \$5,102,500. Other industries showed considerable development. The construction of new railway lines opened up new mining territory in the north. With new iron-ores available and a good market for iron and steel products, new mills were speedily erected and coal mines were called upon for increased output. The coal mines were worked steadily during the summer of 1902, except for a short strike of two weeks' duration in July, and the output for 1902 exceeded 10,000,000 tons. In coke production Alabama was exceeded only by Pennsylvania. The iron-ore mined amounted to 3,500,000 tons, and the normal increase in production of pig-iron was doubled. The city of Mobile increased greatly in importance as a commercial centre. The Mobile, Jackson and Kansas City Railroad pushed north to Hattiesburg, Perry county, Miss., and considerable new timber and mining territory was opened up thereby. If the line is continued farther west, quantities of grain will soon be exported via Mobile. Three new ocean steamship lines were established in 1902, with Mobile as a terminal port. Fruit was a principal item in Mobile's imports, over 300 cargoes entering in 1902. The textile industry continued to expand, and the manufacture of cloth is rapidly superseding that of yarn. Five new cotton mills and several new knitting mills were built in 1902. Employment of children in these mills is more and more decried, and many employers say they would welcome its prohibition, if made general throughout the South. (See CHILD LABOR.) In Alabama, the manufacture of steel rails was begun on a large scale in 1902, as well as that of several small iron products formerly manufactured only in the North and East. Three furnaces, with a capacity of 300 tons of pig iron a day, were started, and the Republic Iron and Steel Company began the construction of a furnace, the capacity of which will be 1000 tons a day. The latest improved machinery was installed in many plants and the cost of labor reduced 20 per cent. in all. The Tennessee Coal, Iron and Railroad Company expended \$1,000,000 for new machinery, and \$1,500,000 for a modern street-car system in Birmingham. The sum of \$2,000,000 was invested in the large power plant on the Alabama River, near Montgomery, and \$3,000,000 in new cotton mills at Huntsville. The Alabama Steel and Wire Company expended \$10,000,000 in the construction of a new steel plant at Gadsden, and \$250,000 in a furnace at Valley Head. The iron and steel industry was very active in the Birmingham district, the payrolls of the district having increased 15 per cent. over 1901, and the volume of wholesale and retail trade fully as much.

The miners employed at Blockton by the Tennessee Coal, Iron, and Railroad Company, about 3000 in number, struck on October 6, 1902, because the company would not discharge certain members of the Miners' Union, who had refused to pay \$1 per month toward the support of the Pennsylvania Anthracite strikers. The company also refused to take that amount from the wages of the men, as demanded by those who were willing to pay. The strikers were strongly condemned in many quarters for their action, and finally returned to work without gaining their point.

Political.—Under the suffrage provisions of the new State constitution, a great change has been wrought. The State contains nearly as many negroes as whites, but in the August registration about 180,000 white voters registered, and only 2500 blacks. In Montgomery County, with 52,000 negro inhabitants, only 27 negroes registered. Ex-Governor Joseph F. Johnston endeavored to obtain the Democratic nomination for Governor on a platform that opposed negro disfranchisement, but was badly defeated by Governor William D. Jelks, who represented the sentiment in favor of the new constitution. One of the most significant events of 1902 was the endorsement, in effect, by the white Republicans, of the suffrage provisions of the

new constitution. The Republicans held a meeting on August 4th, at which they resolved that "Only those shall be permitted to participate in the State and County Conventions who are duly qualified voters under the new Constitution of Alabama." In September, at the Republican State Convention, this resolution was approved and accepted. In November, President Roosevelt appointed Joseph O. Thompson, collector of internal revenue for the District of Alabama, to take the place of Julian H. Bingham, removed for activity in organizing the "Lily White" Republican party, whose State Convention excluded negro delegates, supposedly only on account of their color. Postmaster-General Payne, in defining the President's attitude in this case, said that "Neither the administration nor the Republican party in the North will stand for the exclusion of any section of our people because of their race or color."

Conventions and Platforms.—The Democratic primaries were held on August 25th, the majority of Jelks over Johnston being 20,000. The Republicans nominated J. A. W. Smith for governor. The Republican platform indorsed the President and urged his renomination; favored the organization of labor for its legitimate protection and the enactment of laws for the peaceable and fair settlement of disagreements by arbitration. The convention favored legislation regulating the labor of children in cotton mills; condemned the "spirit which seeks to arouse a prejudice of the people against the railroads"; advocated the "enactment of laws so regulating the railroads as to adequately protect the interests of the people," but expressed opposition to any drastic measures; endorsed the Dingley tariff law; advocated legislation to secure an inter-oceanic canal, and praised the bravery and heroism of our soldiers and sailors in the Philippines.

Elections.—At the regular quadrennial State election held August 4, 1902, a full Democratic State ticket was elected. For governor, Jelks (Dem.), received 67,763 votes; and Smith (Rep.), 24,342. The State legislature in 1902 was overwhelmingly Democratic. The legislature for 1903 consists of 138 Democrats and two Republicans, both members of the lower house.

Other Events.—Fire in the wholesale business section of Mobile, on January 25, 1902, destroyed property to the value of \$300,000. The State suffered from the effects of the great storm that swept over the South in February; winds and floods did an immense amount of damage. Gadsden and vicinity were visited in March by the severest storm known in years. Some sections of the city were completely under water, the power-house was flooded, and the city thrown into utter darkness. At Tuscumbia, on April 6th, Will Reynolds, a negro, was killed after shooting nine of the sheriff's posse. His body was then burned. An excursion train on the Southern Railway, near Birmingham, going at the rate of thirty miles an hour, on September 1, was derailed and plunged down an embankment; twenty-one men were killed and eighty injured. During the session of the National Negro Baptist Convention at Birmingham, at which Booker T. Washington was speaking, on September 19th, a panic and stampede caused the death of 115 persons and injuries to a much larger number. At Littleton, on October 19th, a race riot, in which eight negroes and three whites were killed, occurred.

State Officers.—For 1902: Governor, William D. Jelks; secretary of state, R. P. McDavid; treasurer, J. Craig Smith; auditor, T. L. Sowell; attorney-general, C. G. Brown; superintendent of education, J. W. Abercrombie; commissioner of agriculture, R. R. Poole; commissioner of insurance, E. R. McDavid—all Democrats. For 1903: Governor, William D. Jelks (elected for four years, term ending January, 1907); lieutenant-governor, R. M. Cunningham; secretary of state, J. T. Heflin; treasurer, J. Craig Smith; auditor, T. L. Sowell; attorney-general, Massey Wilson; superintendent of education, I. W. Hill; commissioner of agriculture, R. R. Poole; commissioner of insurance, E. R. McDavid—all Democrats.

Supreme Court in 1902, and until November, 1904: Chief justice, Thomas N. McClellan; associate justices, Jonathan Haralson, John R. Tyson, Henry A. Sharpe, and James R. Dowdell—all Democrats.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

ALASKA, an incompletely organized Territory of the United States acquired by purchase from Russia in 1867, and governed under a civil code passed by Congress in 1900. The total area of Alaska is approximately 599,446 square miles, or one-sixth of the whole territory of the United States. The population in 1890 was 32,142, and in 1900, 63,592, of whom 25,536 were natives. In June, 1902, the population was estimated by the government actuary at 73,000. There were, in 1900, four cities of more than 1000 inhabitants; namely, Nome, 12,486; Skagway, 3117; Juneau, 1864; and Sitka, 1396. Alaska constitutes, by act of 1900, a federal judicial district with three divisions. No delegate is sent to Congress, neither is there any local legislature. The seat of administration is Sitka.

Agriculture, etc.—Experiments carried on during 1902 showed that rye, flax, and wheat can be grown successfully in Alaska. Potatoes and garden vegetables mature well. Hardy varieties of apples, pears, and small fruits thrive well. The United States government has introduced the reindeer into Alaska as a draft and food animal, and the Eskimos have been taught to care for them properly. The total number of domestic reindeer in Alaska, June 30, 1902, was about 7000.

Mining.—The gold-mining industry in Alaska made steady progress during 1902, although the working season was dry and the lack of water for sluicing was a considerable handicap. Pumping plants have been installed, and a small canal, 22 miles in length, to cost about \$1,000,000, was surveyed, to carry water to the diggings on Ophir Creek. Placer grounds of great importance were discovered on the tributaries of the Copper and Nazina rivers, and at Rampart, a settlement on the Yukon. Reports from all parts of the country were favorable, and it was estimated that the gold output for the year 1902 would amount to \$7,823,793. The gold quartz lodes in the Nome region, in the district around Dawson and on Douglas Island, are being successfully developed. See GOLD.

Valuable deposits of copper have been discovered, and during 1902 a large number of new claims were developed on Prince of Wales Island. Bodies of rich copper ore have been discovered beyond the coast range, especially in the Copper River Valley, but their development is not likely to be undertaken until after the construction of a railroad through the region, as it would be impossible at present to haul the ore to a place of shipment. Tin ore has been discovered near Cape York on the Seward peninsula. Deposits of coal are well distributed through the territory, but are not mined to any extent as yet. Petroleum has been discovered on Comptroller's Bay and in the region around Lake Iliamna on the Alaskan peninsula, and prospects for its becoming a valuable product are said to be good. In his annual message for 1902, Governor Brady recommended the establishment of a department of mines for the Territory, with a commissioner and staff of mineralogists and assayers, in order that exact and comprehensive information regarding the mineral deposits of the Territory may be obtained.

Other Industries.—One of the most important industries of the Territory is its fisheries. The salmon pack for 1902 exceeded in value the amount of the original purchase price of Alaska. Much attention was given to the breeding of salmon in order that the numbers may not be depleted. On the fur seal islands, St. George and St. Paul, 22,304 seals were killed in 1902. The great growths of timber in Alaska are hemlock, spruce, yellow cedar, and red cedar. In the southeast the hemlock and the spruce grow everywhere on the mainland and upon the islands. Only a small percentage of the lumber which is now used in Alaska is cut in the Territory. The total value of the skins—bear, otter, mink, fox, lynx, beaver, and wolf—taken annually, is large. Fox farming is tried in many places, but the blue fox is the only one which can be domesticated.

Public Lands.—The difficulty of securing titles to land is hampering progress in general, and is a great check to the development of agriculture. Even railroad companies hesitate to build, as no encouragement is given to people for settling on the lands. The homestead laws of the United States apply only to lands which have been surveyed, and thus far not an acre has been marked out for settlement. In 1901 the sum of \$5,000 was apportioned to Alaska for public surveys. The law fixes the maximum price for this kind of work, but no surveyor who is acquainted with the conditions in that part of the country felt that he could afford to undertake the survey even at the highest rate allowed. The coal-land laws were extended in June, 1900, but, like homesteads, coal must be located upon surveyed lands. At Cook Inlet coal fields, and at Comptroller's Bay and elsewhere, large amounts have been invested in the development of mines and the building of wharves, railway tracks, etc., but there is no assurance of title nor security of tenure. In reference to the homestead laws, it is the governor's opinion that there is no reason why a man, who is enterprising enough to strike out to Alaska should be limited to eighty acres, when everywhere, since the homestead laws were created, a settler has been allowed at least 160 acres. According to statistics, 50,000 people from Minnesota and the Dakotas have emigrated into Manitoba—people who might have gone to Alaska had the laws offered any security of title.

Communications.—General corporations were formed in 1902 for the construction of railroads. Preliminary filings were made with the secretary of the interior under the law of May 14, 1896, providing for right of way for railroads in Alaska. One company selected Valdez as one terminal, and proposes to build a standard-gauge road with branches along the Copper River Valley and across the divide to Eagle City. Preliminary work was begun during the season of 1902 by surveyors and engineers. Another company has projected a road from Resurrection Bay on the southern coast of Kenai Peninsula cutting across toward the Yukon. Two rival companies made arrangements to start in at Iliamna Bay near the entrance of Cook

Inlet and run lines in a northwesterly direction toward Nome and Bering Strait. The railroads will be a great factor in the development of Alaska. At present the charges by pack trains from supply depots on the coast to interior camps, run as high as \$1.25 per pound. A military telegraph system connects the principal towns and posts in the Territory.

Education.—The schools in the incorporated towns during 1902 were doing well, as the law provides sufficient money to conduct them up to a certain standard. There are twenty-eight public schools in the Territory. The school work was placed under the care of the United States Bureau of Education and Congress made appropriations each year for their maintenance until 1901, when the House Committee on Appropriations refused any more money for this purpose. The civil code, approved June, 1900, provided that license fees should be exacted from the various business concerns operating in the Territory. Outside of incorporated towns, one-half the amount of these licenses minus the expenses for the maintenance of their courts was to be used for educational purposes. This has hampered the schools outside of the incorporated towns owing to the uncertainty of the amount of the license money. The economical policy has been discouraging, and the bureau has had to turn a deaf ear to all petitions for new school buildings and teachers for distant communities where children are sadly in need of instruction.

Needs of the Territory.—The most urgent need of Alaska is the granting of general land laws so as to encourage the homeseeker and the industry of agriculture. This would bring the base of food supplies within Alaska's own borders instead of 1000 miles away, as is at present the case. The great majority of the people believe that Alaska should be represented by a delegate to Congress to persist in bringing measures for Alaska's welfare before the committees, look after the interest of her citizens before the Department of the Interior, and occasionally enlighten the House when it has Alaskan matters before it. The governor strongly advises a commission to settle the titles at Sitka. There has been no accurate survey from any initial point since the date of the transfer. The people are holding their possessions upon certificates which were signed by the commissioners twenty-five years ago, and which they had no authority to sign. The growth of the town is thereby naturally hampered.

The work of the coast and geodetic survey needs to be extended, and more aids to navigation, furnished by the lighthouse board, are imperatively demanded. Railways, wagon-roads, and trails are much needed, and the people are anxious to have the government open new roads. What the government has already done through the War Department in the making of the Trans-Alaskan military road from Port Valdez to the crossing of the Tanana River, a distance of 265 miles, has been an immense help to all prospectors, miners, and traders in that region.

Judiciary Scandal.—The scandal in which Judge Noyes was involved in 1901 was ended on January 6, when he and others who entered into a conspiracy with Alexander McKenzie, president of the East Alaska Gold Company, to take possession of the richest Nome mine were sentenced. The fine imposed on Judge Noyes for contempt was \$1,000. District-Attorney Joseph K. Wood was sentenced to four months' imprisonment, and his assistant, C. A. S. Frost, was sentenced to imprisonment for one year.

Other Occurrences.—During April and May there were several eruptions of the Mount Redoubt volcano, which is situated to the northwest of Cook Inlet. The ashes were carried to a distance of 50 miles. Mount Blackburn also became active. Earthquakes resulting from this cracked the surface of the Muir Glacier. During the summer, the remains of a mammoth were found at Keewalik, 300 miles northwest of Nome; the tusks were 12 feet long and weighed 170 pounds each.

ALASKAN BOUNDARY QUESTION. Reports, in December, 1902, of the renewal of negotiations at Washington between John Hay, secretary of state, and Sir Michael Herbert, the British ambassador, looking toward a settlement of the long-standing dispute over the Alaskan boundary, foreshadowed the probable early signing of a treaty satisfactory to both Canada and the United States. The conflicting claims of Great Britain and the United States as to the boundary line between Canada and the Alaskan territory centre in the interpretation of two clauses in a treaty entered into between Russia and Great Britain in 1825. These articles—numbers 3 and 4 of the treaty—defined the boundary between the Russian and British possessions in America, article 3 describing the course of the line, and article 4 containing a more explicit statement as to the interpretation of article 3. It is upon the interpretation of this interpretation that the whole question rests. The article reads as follows:

"Article IV.—With reference to the line of demarcation laid down in the preceding article, it is understood—First, that the island called the Prince of Wales Island shall belong wholly to Russia. Second.—That wherever the summit of the mountains, which extend in a direction parallel to the coast, from the 56th degree

of north latitude to the point of intersection of the 141st degree, shall prove to be at the distance of more than ten marine leagues from the ocean, the limit between the British possessions and the line of coast which is to belong to Russia as above mentioned, shall be formed by a line parallel to the windings of the coast, which shall never exceed the difference of ten marine leagues therefrom."

In 1867 Alaska was purchased from Russia by the United States, who thereby assumed, in regard to the boundary, the position formerly occupied by Russia. Up to that time there had never been any suggestion of a difference of opinion as to the boundary line, a situation possibly due to some extent to the fact that the region was then but little known. Very soon after the purchase by the United States, however, steps were taken looking toward a demarcation of the boundary line. In 1872 the legislative assembly of British Columbia passed a resolution requesting the Dominion government to take steps toward starting a survey of the line, and in December of the same year President Grant, in his annual message, recommended the appointment of an international commission to define the boundary. No action was taken on either the legislative resolution or the President's recommendation, however. In 1886 a joint commission was again proposed, and in 1888 conferences were held between representatives of the United States and Canadian governments, and finally, in 1892, a convention was entered into for a joint survey in order to ascertain the data necessary for the permanent delimitation of the boundary line. The surveys were completed, but no recommendations made as to the boundary line. It was not until after the rush to the Klondike gold fields in 1896, that the matter appeared of enough importance to the Canadian authorities to call for a formal protest against the American occupation and control. By the protocol of May, 1898, the matter was one of the subjects referred for settlement to the Joint High Commission, which, however, adjourned without coming to any agreement. On December 20, 1899, a *modus vivendi* was agreed upon providing for a temporary boundary line. By the terms of this agreement which was, on the whole, to the advantage of the United States, the line was placed at 22½ miles above Pyramid Harbor, which shut off the Canadians from a shipping point on the Lynn Canal, and made no concessions for a free port or free transfer of Canadian goods through American territory. On this *modus vivendi* of 1899, the matter has rested.

The dispute turns principally on the interpretation of the words "a line parallel to the windings of the coast," contained in article 4 of the Anglo-Russian Treaty of 1825. The United States claim rests upon a literal interpretation of the words, assuming that the treaty gave Russia control of all the coast of the mainland, and that the coast-line followed the windings of the coast, even to the head of the longest inlets. And this contention seems to be borne out by a perusal of the existing accounts of the negotiations preceding the Treaty of 1825, by both British and Russian maps of the region, and by the complete acquiescence of the British and Canadian authorities in the American occupation until after the opening of the Klondike. The British and Canadian contention is based on their assertion that the line as designated in the Treaty of 1825, was not meant to follow the actual windings of the coast, but rather to follow the general trend of the coast, cutting across the headlands of some of the bays and inlets, particularly the Lynn Channel, and thus giving them access to the tide-water. The Canadian government has pressed for a settlement of the question by arbitration, in which they were willing to make the concession that arbitration should be based on the same principle as that in the Venezuelan case—namely, that title should be considered as being made good by a proof of fifty-year holding, the term "holding" to be regarded as meaning political administration whether the region was actually settled or not. The United States has consistently refused to arbitrate, declaring that the Venezuelan and Alaskan questions were not comparable, and furthermore that it was against the policy of the United States to arbitrate a question involving territory that had been so long occupied by American citizens and tacitly acknowledged as belonging to them.

ALBANIA, a region of European Turkey lying between Macedonia and the western coast. See **TURKEY** (paragraph Albania).

ALBATROSS EXPEDITION. See **ZOOLOGICAL EXPEDITIONS**.

ALBERT, FRIEDRICH AUGUST, King of Saxony, died at Dresden on June 19, 1902. He was born April 23, 1828, at Dresden, and began his military career at fifteen years of age as an ensign. Afterwards he entered the University of Bonn, and was a diligent student, especially of military science, until 1848, when he rejoined his regiment. In 1849 he took part in the Danish war, and won high praise for bravery. Upon the accession of his father, John, in 1854, he became crown prince and president of the council. As commander-in-chief of the Saxon forces he took the field in the war between Prussia and Austria in 1866, when Saxony allied with Austria, and commanded with distinction at the battles of Münchengrätz and Königgrätz. On the formation, the same year, of the North German Confederation, Sax-

ony was included, and the army formerly commanded by the Prince Albert became the twelfth corps in the army of the confederation. In the Franco-Prussian war his services were highly important. At the battle of Gravelotte he led a brilliant and successful attack upon a difficult French position and commanded the army of the Meuse, which cooperated with the two other German armies in closing upon Sedan. In 1873 he succeeded his father as King of Saxony, and throughout his reign was as ardently devoted to the interests of peace as he had formerly been vigorous and active in the field. He married Caroline, daughter of Prince Gustav of Vasa in 1853. He was succeeded in the kingdom by his brother George (*q.v.*).

ALCOHOL continued in 1902 the subject of much experimentation, chiefly in the direction of determining its food value in health and disease. The consensus of opinion seems to be that while alcohol possesses a certain value in retarding tissue waste, in febrile or wasting diseases, its use in health is unnecessary. Dr. A. Ott, of Germany, after studying its effects in tuberculosis, concludes that alcohol in fever, as in health, tends to decrease the destruction of albuminous tissue to a degree equal to that of iso-dynamic amounts of carbohydrates, and that it is not a satisfactory food-stuff because we have better at our command; but when used in moderate amounts in febrile subjects it has no unfavorable effect, and particularly in chronic diseases of the lungs, when associated with depression, may do good. Arthur Clapp, of Berlin, conducted some experiments to show the effects of alcohol assimilation and found that it consumed nitrogenous materials, and that it had no appreciable effect upon the absorption of food in the intestines. F. S. Bennett, of England, finds that alcohol does not influence nitrogenous metabolism when given in moderate amounts any more than does fat, that it frequently protects the body proteids and fat from consumption, and that in moderate doses it retards many vital processes. Ch. Valentino shows that alcohol acts on the organism as (1) a fluid, (2) a poison, and (3) a dehydrant. As a fluid, it causes a rise in blood pressure and acute dilatation of the heart; as a poison, it is toxic (as shown by Rabuteau, Dujardin-Beaumetz, and Audigé) in proportion to the number of CH_2 groups contained; its dehydrating action is particularly manifested in acute alcoholism, drunkenness being the result of its toxic and coma of its dehydrating action. He concludes that it is much more dangerous to drink a given amount of alcohol without water than well diluted. R. W. Jones, of England, as the result of his investigations into mental dissolution in relation to alcohol, finds that the forms of insanity that result most frequently from drinking are: (1) amnesic; (2) delusional; and (3) chronic varieties which end in dementia.

ALEXANDER, Mrs. ANNIE, the pen-name of Annie Alexander Hector (*q.v.*).

ALFONSO XIII., King of Spain, was enthroned on May 17, 1902, having attained his majority on that day. He was born May 17, 1886, six months after the death of his father, Alfonso XII. His education, under the supervision of his mother, Queen Christina, who acted as regent during his minority, was thorough, and he began his reign under the political tutelage of Señor Sagasta, the veteran statesman whose last term as prime minister was in large part devoted to smoothing away the initial difficulties of the young ruler. His self-control during the enthronement festivities, when several anarchists were arrested for plotting against him, and also during the excitement of the attempted assassination of his grand chamberlain in a royal procession, produced a reassuring impression that has done much to discredit stories about his eccentricities. Since his accession there has been much political agitation, not only because of the industrial difficulties of Spain resulting from the Spanish-American war, but on account of popular dislike of the religious orders. Thus far the popular unrest has not produced any apparent designs against the throne and person of the young king or diminished his popularity. Until the last few years Alfonso's health was delicate, but since coming to the throne his appearance has indicated a more robust constitution. In manner he is frank, though somewhat imperious, and his disposition is said to be kindly. Of his mental capabilities the tests thus far have not been adequate to warrant an opinion as to whether he has the shrewdness and decisive character to deal wisely and fairly with the troubled conditions in Spain; but the presumption afforded by the excellent manner in which he has conducted himself in his youth is altogether in his favor. After his enthronement he visited a number of the Spanish cities.

ALGERIA, a country of northern Africa, on the Mediterranean Sea, between Tunis and Morocco, is usually regarded as a colony, but is administratively a province of France. The capital is Algiers, with 120,000 inhabitants. The three organized departments, Oran, Algiers, and Constantine, comprising Algeria proper, have an estimated area of about 184,474 square miles, but the southern boundary is not well defined and a part of the Sahara, with an area of something like 125,000 square miles, is, for the purposes of administration, attached to Algeria. The total population of the three districts was, in 1901, 4,774,042, divided as follows: Algiers, 1,631,-

476; Oran, 1,103,108; Constantine, 2,039,458. The population of Algiers, the principal town, was 120,000 (1900); Oran, 85,081 (1896); and Constantine, 51,997 (1896). The French population in 1896 numbered 318,137, but has increased very rapidly since that time. In that year there were also resident in the country 446,343 natives of other foreign nations. The population of the Sahara region numbered about 50,000, comprising practically independent nomad tribes. The native population is entirely Mohammedan.

The government is administered by a civil governor-general (M. Paul Revoil since 1901), acting in constant communication with the French ministry. He is assisted by a consultative council and a superior council, composed of delegates chosen by each of the departmental councils, which discusses and votes the annual colonial budget. The legislative power is exercised by the French parliament, in which each department is represented by a senator and two deputies. The colonial revenue, derived largely from customs, direct taxes, and monopolies, amounted, according to the budget estimate for 1902, to 56,470,947 francs, and the expenditure, excluding that for war and marine, to 54,384,662.

The country is largely agricultural, the acreage of the principal crops in 1900 being as follows: Barley, 3,635,995; wheat, 3,293,550; vines (1901), 375,136; oats, 97,836. There are 695,058 acres of cork forests belonging to the State. Silk culture is in a thriving condition, the weight of cocoons produced in 1899 being 25,688,250 pounds. Other important products are olives, esparto, dates, and flax. There are valuable mines of iron, zinc, lead, silver, copper, and coal.

The commerce of the country is largely in the hands of the French. The special commerce in 1900 reached a value of 313,330,000 francs for imports, and 229,364,000 francs for exports. The chief export is wine, the value of which exported to France in 1900 was 50,433,000 francs. In the same year France took cereals to the value of 37,844,000 francs. In 1901 there were 1818 miles of railway open for traffic, and 99 miles of tramway.

History.—The anti-Semitic feeling which, in 1901, resulted in considerable rioting, seemed to have died down considerably during 1902, but a writer in the *Nouvelle Revue* declares that as a purely political movement, it is gathering force. At the same time the Jewish population is increasing at a much greater rate than the French. Elections to the legislative assembly took place on April 27 and May 11, 1902, and resulted in a Republican victory, thus assuring a continuation of the present policy which controls French-Algerian relations. A decree of March 31 marked a step toward a reorganization of local administration by the establishment of rural agricultural boards, with varying and peculiar powers, elected on a classified suffrage including women. During the year 1902 there was considerable discussion in official circles of the proposal to divide Algeria into a northern (civil) and a southern (military) division, allowing the latter practical autonomy. During June a punitive expedition was undertaken against the Tuaregs in southern Algeria, whose depredations had been causing considerable loss to merchants and traders.

ALLMERS, HERMANN LUDWIG, a Frisian poet and well-known figure in the "marshland," died March 9, 1902, at Rechtenfleth, on the lower Weser, where he was born February 11, 1821. His artistic inclinations led him to abandon the approved farming life of the region, and at an early age he left home to study in Berlin, Munich, and Nuremberg, and to travel later in Switzerland and Italy, as well as in Germany. On his return to Rechtenfleth the fostering of local art and history became his chief care, and his ancient homestead gained renown for the patriarchal hospitality there dispensed. His *Marschenbuch* (1858) depicts his native region. Others of his works are: *Dichtungen* (1860); *Römische Schlendertage* (1869); *Electra*, a drama (1872); *Dichtungen zu von Dörnbergs kulturgeschichtlichen Bildern aus dem Nordsee-Marschen* (1882); and *Fromm und Frei*, religious poems (1889). A complete edition of his works was published in 1891-95.

ALTGELD, JOHN PETER, ex-governor of Illinois, died at Joliet, in that State, March 12, 1902. He was born near Berlin, Germany, December 30, 1847, and when three years of age was brought by his parents to the United States. After a childhood spent on a farm near Mansfield, Ohio, with but meagre education, he enlisted as a volunteer in the Union Army, in 1864. At the close of the war he obtained enough education to secure him a teacher's certificate, after which he removed first to St. Louis, and then to Savannah, Mo., where he taught school and studied law at the same time, being admitted to the bar of the State in 1870. In 1874 he became the prosecuting attorney for Andrew County, Mo., and in 1875 removed to Chicago. There he worked obscurely as a lawyer for nine years before his name was first brought out in a political nomination. In 1884 he was the Democratic candidate for Congress in the Fourth Illinois district, but was unsuccessful. Two years later he was elected a justice of the Cook County Superior Court. In 1890 he became chief justice of that court, and in 1892 left the bench. In the meantime the radical sec-

tion of the Democratic party in Chicago had fixed upon him as a promising leader. His advocacy of their views brought him the Democratic nomination for the governorship of Illinois, to which office he was triumphantly elected in 1892. His term as governor was one of the most notable in the history of Illinois, owing to the attention attracted by the application of his doctrinaire principles. During the Chicago railroad strike of 1894, the holding up of trains by the strikers interfered with transmission of the mails, and he refused tacitly to suppress the mob. President Cleveland's decision to send federal troops into Illinois to prevent stoppage of the mails evoked from Governor Altgeld a long and elaborate protest, which, however, was disregarded. The pardon of three condemned anarchists, who were undergoing sentences for their connection with the murder of policemen caused by the bomb-throwing in Haymarket Square, Chicago, on May 4, 1886, raised a storm of indignation against Altgeld throughout the country. To this the reply was that the pardon was granted exclusively on legal and technical grounds. He held that the pardoned men had not been justly convicted. At the convention which nominated William Jennings Bryan for the Presidency in 1896, he was able substantially to influence the character of the party platform, and the planks denouncing judicial injunction, interference with State rights, and advocating the free coinage of silver were in large part due to his activity. In 1896 he was again a candidate for governor, but was defeated by John R. Tanner, the Republican candidate, by a plurality of more than 100,000. Three years afterward he sought election as mayor of Chicago on an independent ticket, but was defeated by Carter Harrison. The later estimate of Altgeld, while it denounces him as governor, yet recognizes the honesty and marked ability of the man, as well as the moral earnestness which accompanied his political idealism.

ALUMINUM. See MINERAL PRODUCTION.

ALVES, FRANCISCO DE PAULA RODRIGUEZ, was elected president of Brazil, in March, 1902, as successor to President Campos Sales, and was inaugurated on November 15, the anniversary of the proclamation of the country's independence. Dr. Alves is a lawyer by profession as well as a capable financier, and at the time of his election was governor of the state of Sao Paulo. He is said to be a safe and conservative republican, of excellent administrative ability, and has for several years been prominent in politics and recognized as a probable president. His election is said to have strengthened the position of Brazil in European financial circles. See BRAZIL (paragraphs on History.)

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE. See POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF.

AMERICAN BOARD OF COMMISSIONERS FOR FOREIGN MISSIONS, the oldest foreign missionary society in the United States, founded 1810 and incorporated two years later. Its first missionaries, to India, were sent out in 1812, and since that date, the board has commissioned 2384 persons. There are now 20 missions, including 101 stations and 1301 out-stations, in Africa, Turkey, and Bulgaria, India and Ceylon, China, Japan, Hawaii, Micronesian Islands, Mexico, Spain, Austria, and the Philippines. During 1902 37 persons were added to the missionary force; 19 new churches were established; and the board entered the Philippines, where, probably, the work will be centralized in Mindanao. The churches, under the auspices of the American Board number 524, with 55,645 members, an increase of 5609 during the year; there are 1266 educational institutions of various grades, having 60,964 pupils, 167 being students for the ministry. The 873 Sunday-schools are attended by 60,321 scholars. The missionary force includes 4130 workers—549 missionaries from the United States and 3581 native laborers. Native contributions, so far as reported, aggregated \$167,512. The American Board is supported by voluntary contributions of churches and individuals and by legacies; it began the fiscal year 1902 without debt, and its total receipts were \$845,106. Through the state department \$57,933 was received, this sum being 25 per cent. of the total award made to the board for property losses during the Boxer outbreak of 1900 in China. Miss Ellen M. Stone, whose capture by brigands in Macedonia, September 3, 1901, excited much interest, was released on February 23, 1902, on payment of a ransom of \$68,200, contributed by friends in America, the amount originally demanded having been \$110,000. The hostile criticism aroused by Miss Stone's action in publishing the story of her experiences and in entering the lecture field was met by the statement that she hoped to devote the money received to reimbursement of those who assisted in raising her ransom, and to missionary work. In Hawaii, the missions, though still aided by the board, will probably be soon transferred to the care of the Hawaiian Evangelical Association, which in 1902 assumed a part of the expense. It was voted at the annual meeting of the board to allow the Prudential Committee to transfer the Micronesian Mission, excepting Guam, where a new station has been successfully opened, to the London Missionary Society, which possesses

missionary vessel, or to a German society, since the islands belong to Germany. The ninety-third annual meeting of the American Board, held October 14-17 at Oberlin, Ohio., was signalized by the laying of the corner-stone of a memorial arch to the eighteen missionaries who lost their lives in China in 1900. Several of these missionaries were educated at Oberlin College. One of the interesting features of the session was an account of the deputation that visited the missionary fields in India during 1901. President, Samuel B. Capen, LL.D.; district secretaries, Rev. Charles C. Creegan, D.D., Fourth Avenue and Twenty-second Street, New York City, and Rev. A. N. Hitchcock, Ph.D., 53 La Salle Street, Chicago. Headquarters, Congregational House, Boston, Mass.

AMHERST COLLEGE, Amherst, Mass., founded 1821. The attendance during 1901-02 was 404, under a faculty of 35 instructors. The income for the year was increased to \$109,000, during which period gifts to the amount of \$100,000 were received. The college now owns property to the value of \$2,800,000. Plans were completed in 1902 for the erection of an astronomical observatory, costing \$50,000. Students may complete the course in three years by having two term credits at entrance and taking six courses a year, and in three years and a half by taking six courses a year after the Freshman year. President, George Harris, D.D.

ANÆSTHESIA. Investigations into this subject during 1902 were chiefly in the direction of improving the technique and perfecting the use of spinal anæsthesia. This method, suggested in 1885 by Dr. J. L. Corning, of New York, has only recently been generally adopted by the medical profession, in cases in which on account of cardiac or pulmonary disease general anæsthesia is contra-indicated. Medullary narcosis is obtained by injecting the anæsthetizing substances into the spinal canal between the second and third or the fourth and fifth lumbar vertebrae. More or less complete anæsthesia is thus secured in the lower extremities and lower portion of the trunk, and obstetric, gynecological, and other operations are thus made possible without loss of consciousness on the part of the patient. In place of cocaine, which was originally used, eucaïne and tropa-cocaine have lately been employed, with the object of avoiding certain disagreeable manifestations of the former drug. Friedrich Neugebauer, of Vienna, who has used tropa-cocaine in a large number of operations upon the lower portions of the body, reports favorably on its action. The longest operation lasted one and a quarter hours, and the drug had to be repeatedly injected. That this procedure is not without danger is pointed out by different observers, who mention sudden death, attacks resembling apoplexy, syncope, profound weakness, severe vomiting, and headache, as results of the operation, independent of the drug used. For new local anæsthetics, see the following article and NERVOCIDINE.

ANÆSTHESIN (Ritsert's) is the para-amido benzoic acid ethylester. It is white, odorless, and almost tasteless powder, and causes, when applied to the skin, a transitory burning sensation. While the substance is a local anæsthetic, it is not intended to be used like cocaine, since its anæsthetic properties are slighter; but when it is applied to wounds or raw surfaces, it diminishes the pain, and, according to Speiss, promotes rapid healing. Its main usefulness, however, is for irritative effusions of the mucous membranes, and accordingly it is of value in whooping cough and particularly in coryza. Von Noorden has given it for gastric hyperæsthesia, angina, dysphagia (difficulty in swallowing), laryngeal hyperæsthesia, painful hemorrhoids, irritation of the bladder, and pruritus. Leg ulcers also are benefited by it.

ANAM, or ANNAM, a French protectorate on the China Sea, extending from Tonquin on the north to Cambodia and Cochinchina on the south, forming a part of the French colony of Indo-China. The area is about 52,100 square miles, and the estimated population (1898) 6,394,250. The capital is Hué, with a population of 50,000. The administration of internal affairs, nominally in the hands of the native king (Than Thai) and his officials, is in reality managed by the French resident. The customs and finances are in charge of French officials. The local budget in 1901 amounted at 2,081,416 piastres, and the expenditure of France on Anam and Tonquin combined, amounted (budget of 1901) to 1,084,913 francs. (The franc is worth 19.3

cents and the piastre about 2.4 francs.) The principal products are rice, maize, spices, tobacco, sugar, bamboo, and coffee. There are native manufactures of raw silk, coarse crêpe, and earthenware, and valuable deposits of coal, iron, copper, zinc, and gold, still very little developed. The imports in 1899 were valued at 4,173,567 francs, and the exports at 6,567,491 francs. Since that date the customs department has been combined with that of Cochín-China (*qv.*). A railroad, 65 miles in length, from Hué to the seaport of Turan, is projected. See **INDO-CHINA**.

ANARCHY. See **UNITED STATES** (paragraph **Anarchy**).

ANDRADE, JOSE, a prominent Venezuelan diplomat, died in New York City, March 20, 1902. He was born in the state of Losandes, Venezuela, in 1838, and some years after entering public life became speaker of the Venezuelan Congress. From 1893 to 1899 he was minister to the United States, representing his country at the time of the Venezuelan boundary dispute in 1895. He accompanied President Harrison to England and assisted him in conducting the negotiations which ultimately secured a settlement of the difficulty by arbitration. Señor Andrade was at different times the representative of his country at Paris, Madrid, Rome, and Berlin.

ANDREW AND PHILIP, BROTHERHOOD OF, established in 1888 for "the spread of the kingdom of Christ among men," is an interdenominational order, having members in some 20 denominations. The brotherhood is found in 35 States, where its enrollment includes 550 chapters, with a membership of 15,000. It is officially represented by the *Brotherhood Star*, published monthly in New York City. President, Rev. Rufus W. Miller, D.D.; general secretary, Rev. J. G. Hamner, Jr., 189 Garside Street, Newark, N. J.

ANDREWS, CHARLES BARTLETT, former governor of Connecticut, died September 12, 1902, at Litchfield, in that State. He was born November 4, 1834, at Sunderland, Mass., graduated at Amherst College in 1858, and received the degree of LL.D. from Amherst, Wesleyan, and Yale. In 1863 he settled in Litchfield and became active in politics as a Republican. He served in the State senate in 1868 and 1869, in the house in 1878, and was governor from 1879 to 1881. He was chief justice of the supreme court of Connecticut from 1889 until he resigned on account of failing health in 1901. His eminence as a jurist and the esteem in which he was held were attested by the constitutional convention, held in Connecticut, January, 1902, in choosing him unanimously for presiding officer.

ANEURISM. A new treatment has been proposed and carried out with success in cases of aneurisms of the large arteries, particularly of the thoracic and abdominal aorta, that are not amenable to operation. These huge blood tumors have hitherto been treated by the introduction of foreign bodies such as wires and needles, in the hope of promoting clot formation and gradual solidification of the tumor with, however, but indifferent results. Recently advantage has been taken of the hemostatic properties of gelatin in the treatment of this condition. This substance is dissolved in an artificial serum and injected into the loose tissue of the thigh at intervals of two or more days. After from three to twelve injections are given, over a period of one or two months, the aneurism diminishes in size and becomes hard, while pain, discomfort, and inability to make any exertion disappear. Cases of complete cure by this method have been reported by K. Barth, of Germany, Surgeon-General Dusolier, of France, and others. The operation is called after Lancereaux, who first suggested it.

ANGLICAN CHURCH, or the Anglo-Catholic Church, a term applied in particular to the Church of England, but, in a wider sense, including also the churches derived from the established church of England. See **ENGLAND, CHURCH OF**; **IRELAND, CHURCH OF**; and **PROTESTANT EPISCOPAL CHURCH**.

ANGOLA, or PORTUGUESE WEST AFRICA, a dependency of Portugal on the Atlantic between the Congo Free State and German Southwest Africa, has an estimated area of 484,800 square miles and an estimated population of 4,119,000. The seat of government is St. Paul de Loanda, where the administration is carried on by a governor and his subordinate appointed by the crown. The estimated revenue and expenditure for the fiscal year 1901-02 was 1,844,075 milreis and 1,994,072 milreis respectively; for 1902-03, 1,743,413 and 2,026,212 respectively. The value of the gold milreis and the face value of the paper milreis are \$1.08. The most important product is rubber, but production is impeded by lack of internal communications. In 1899 imports and exports in milreis amounted to 6,314,846 and 7,035,414 respectively; in 1900, 7,267,239 and 5,369,818 respectively. The imports, principally textiles, are largely of British and German manufacture; the exports, chiefly rubber and coffee, are in great part sent to Portugal. Economic conditions are unfavorable on account, to a considerable extent, of the customs tariff favoring Portuguese trade. The Ambaca Railway, which is in operation from St. Paul de Loanda to the Lucalla River, 225 miles, will be extended, it is

hoped, to Malange, about 124 miles farther. A line about 20 miles long connects Benguella with Katumbella, and a project has been approved for building a railway from Benguella to a point in the interior about 500 miles distant. In the summer of 1902 the Portuguese had considerable difficulty in curbing several native revolts.

ANTARCTIC EXPLORATION. Excellent progress was made by the three scientific expeditions that worked in the Antarctic regions during 1902; and in addition a fourth expedition, also for scientific purposes, started to the far south in the summer of that year. The investigation of magnetic problems is, of course, the main object of all these enterprises, and all the expeditions are thoroughly equipped with apparatus to this end. They are also provided with equipment for other scientific observations, but in this matter there has been some specializing among the various parties. The Swedes, for example, were fitted to do specialized work in geology, and the new Scottish expedition, which meant to remain at sea, was provided with a fine set of apparatus for meteorological and oceanographic investigation. Magnetic stations have been established all around the world. The series of stations consisting of the Bristol observatory in Victoria Land, the Argentine station in Staten Island, and the German station in Kerguelen has been supplemented by a second German station at Samoa. The observations in all these stations will be continued until March 1, 1903.

The National Antarctic Expedition.—At the end of 1902 nothing had been heard of the British ship *Discovery* since she left Port Chalmers, New Zealand, for Victoria Land, December 24, 1901; but during 1902 reports of defects in her construction contained both in letters from members of the advance party who accompanied her to the far south, and in reports from members of the Royal Geographical Society who left the ship at New Zealand, were published in various periodicals. According to these reports the *Discovery* not only leaked badly but also rolled heavily in the slightest seaway. Meanwhile, in 1901-02 the Royal Geographical Society collected £23,000 for a relief expedition. The ship purchased was the whaler *Morning* of Tonsberg, Norway. The vessel displaces 450 tons, is 140 feet long by 31½ feet beam, and draws about 19 feet of water. The commander of the expedition was Captain William Colbeck of the Royal Naval Reserve. He was captain of the *Montebello*, a Wilson line steamer, and was a member of the *Southern Cross* expedition under Mr. Borchgrevink in 1900. The other officers of the *Morning* were Rupert England, E. K. Y. Evans, Gerald S. Doorly, George A. Mulock; J. S. Morrison was engineer and George Adams Davidson was surgeon. The *Morning* had a crew of eight petty officers, nine seamen, and three firemen. The relief party set sail July 9, 1902, for Lyttleton, New Zealand, to refit and take in supplies. It arrived in that port November 16. Captain Scott of the *Discovery* had planned to leave records in zinc cylinders at Cape Adare, Possession Island, Cushman Island, Wood Bay, Franklin Island, Cape Crozier, and at the spot in the ice barrier at which Borchgrevink landed in 1900, and from which he pushed across the ice to the farthest south (78° 50'). The *Morning* was instructed to visit all these places. Should the *Discovery* be found, Captain Colbeck was to work under the orders of Captain Scott until the two vessels shall return to Lyttleton, where they were expected in the spring of 1903. Should the *Morning* not meet the *Discovery* the relief party is instructed to lay down depots of supplies at Cape Adare, at Wood Bay, and at Cape Crozier, before returning to New Zealand. If no trace of the *Discovery* shall be found the assumption is that she has passed beyond the great ice barrier to the eastward of the 164th meridian, and the *Morning* is instructed not to search for her.

The German Antarctic Expedition under Dr. Erik von Drygalski, which left Kiel, August 11, 1901, on the *Gauss*, and arrived at Cape Town November 23, was detained there longer than was anticipated. The ship was somewhat foul and leaked badly; she was therefore recaulked. The ventilating arrangements had to be amplified, and laboratory and other breakable articles were replenished. On October 12, 1901, a supply ship, the steamer *Tanglin*, left Sydney for Kerguelen carrying coal and supplies for the *Gauss*, as well as for the Kerguelen party, and the Siberian dogs, a private gift to the expedition. Two of the scientific members of the expedition, Herr J. J. Enzensprenger and Dr. Luyken, were aboard the *Tanglin*. On November 9, 1901, after a hard trip, Kerguelen was sighted. Beri-beri broke out among the crew, which was composed mostly of Chinese; two of them died, and others were more or less affected. The crew then mutinied and the captain and the scientific staff had to do the work of landing supplies and building houses. It was also found that the theodolite and other magnetic instruments had been left behind, so no observations could be taken before the arrival of the *Gauss* with instruments. The *Gauss*, meanwhile, had left Cape Town December 9, and reached Kerguelen January 2, 1902. In spite of bad weather she had taken thirteen soundings in this region where no soundings had before been made. Instead of finding the *Tanglin* at Three Island Harbor in Royal Sound, as had been agreed, Dr. von Drygalski found a letter direct-

ing him to the station that had been established in Observatory Bay near the position occupied by the English transit of Venus expedition. There the party landed by the *Tanglin* was found in poor quarters. The vessel had already gone, leaving the coal and supplies on the beach. When the *Gauss* arrived at Kerguelen, she was again leaking so badly that the sound of the water slopping about under the plates of the engine-room floor could be plainly heard; this leak was repaired, however, and on January 31, 1902, the *Gauss* sailed for the far south leaving a party of five at the Kerguelen Station, consisting of Mr. J. J. Enzensprenger, Dr. Luyken, Dr. Werth (the biologist), and two sailors. They were to remain there until March 20, 1903, for the purpose of carrying on meteorological and magnetic observations in cooperation with the stations at Staten Island, Samoa, Victoria Land, etc.

The *Gauss* was provided with food to last until 1904. She had 400 tons of coal aboard. The condition of the ship was satisfactory to the leader, and the dogs were in good condition, only three having died on the way to Kerguelen. The first destination of the party was Termination Island, seen by Wilkes in 1840, which the *Challenger* party failed to find, however, in 1874. The expedition will then follow the ice barrier westward until it finds open sea and is able to penetrate to the south. The leader will attempt to discover whether there is any connection between Victoria Land, Kemp, and Enderby Lands. If there is no connection he expects to emerge in the South Atlantic. After the sailing of the *Gauss* the plans of the expedition were enlarged. It was then estimated that the expedition would cost £75,000 instead of £60,000 as was first planned. These figures do not include the work of the Kerguelen Station. Complete official reports of the work of this station to April 2, 1902, as well as the voyage of the *Gauss* from Kiel to Cape Town and thence to Kerguelen, were published in the *Veröffentlichungen des Instituts für Meeres Kunde und des geographischen Instituts*, Berlin.

The Swedish Expedition.—After leaving Buenos Ayres on December 20, 1901, Mr. Otto Nordenskjöld's party on the *Antarctic* sailed for the Falkland Islands. They arrived at Port Stanley on December 31 and thence went to the Argentine Observatory on Staten Island for the purpose of comparing instruments. They arrived January 6, 1902, but were unable to make comparisons, as they found the observatory uncompleted. The first Antarctic land sighted (January 11) by the expedition was King George Island of the Shetland Group, and the party made their first far southern landing at Harmony Cave, Nelson Island. The *Antarctic* sailing westward, proceeded to the mainland and ascertained that the coasts of Louis Philippe Land and Graham Land are connected. The previous supposition had been that Louis Philippe Land was an island. On February 12, 1902, the supplies for the winter party were unloaded at Cape Seymour, on the east side of Graham Land, Admiralty Inlet, near Great Snow Hill Glacier. The wintering party comprised Dr. Nordenskjöld; Dr. G. Bodman, meteorologist and magnetician; Lieutenant Sobral, who joined the *Antarctic* at Buenos Ayres, assistant magnetician; Dr. E. Ekeläf, physician and biologist; and two sailors. Sledge journeys were to be made during the fall and spring as far south as possible. The *Antarctic*, under Mr. T. G. Andersson, the geologist, as acting scientific leader, left Cape Seymour February 21, 1902, for the Falkland Islands, and reached Port Stanley, March 26. The wintering party was to be called for about January 1, 1903. Dr. Nordenskjöld had made plans for a winter's trip by the *Antarctic* party to South Georgia for hydrographical and zoological work. For this purpose the *Antarctic* left the Falklands April 11, and arrived at Cumberland Bay, South Georgia, on the 22d. Soundings were taken, the last one showing a deep sea between Shay Rocks and South Georgia and no connecting marine ridge. On May 1 Mr. T. G. Andersson, Mr. Dure, Mr. Scotsberg, and one of the crew landed to investigate the country while the *Antarctic* made a two weeks' cruise across to Possession Bay and the Bay of Isles. On May 12 the vessel returned and remained in Cumberland Bay until June 14, making daily trips to sound and dredge the bay. During the expedition's stay in Cumberland Bay a surrounding area of 300 square miles was surveyed and mapped. On June 15 the *Antarctic* sailed for the Falklands and arrived July 4. It was Dr. Nordenskjöld's intention to remain a second winter in the south.

The Scottish Expedition.—The fourth important Antarctic expedition in the field in 1902, the Scottish National Antarctic Expedition, also called the Bruce-Robertson Expedition, under the leadership of Dr. W. C. Bruce, Captain Robertson being in command of the vessel, sailed in the steamer *Scotia* from Troon, Norway, November 2, 1902. The expedition reached Funchal, Madeira, November 20, where the coal given the expedition by the Union Castle Line was taken aboard; it then left for the Falkland Islands, November 23, where more coal and supplies were to be shipped. From Port Stanley the *Scotia* was to sail eastward 1000 miles, investigate the Sandwich Islands, and then turn southward. The only other explorer who has visited this Antarctic region is Capt. James Weddell, also a Scotchman, who

sailed from Leith in 1823 and in the following year, in an open sea, made a higher southing than any one before the day of Ross, and saw open water before him. Great care will be used in the investigation of the region in $68^{\circ} 34' S.$, $12^{\circ} 49' W.$, where Ross got the sounding 4000 fathoms and no bottom. The Scotchmen will also ascertain whether the "deep" reported by the *Valdwia* between the Bouvet Islands and Enderby Land extends far toward the westward. The ship used for the expedition, the *Scotia*, was formerly the whaler *Hecla*. She was thoroughly overhauled by the Ailsa Shipbuilding Company at Troon under the supervision of Mr. G. L. Watson. The *Scotia* is a barque-rigged, auxiliary screw steamer, of about 400 tons, 140 feet long by 29 feet beam, drawing 15 feet of water. She was equipped with new engines and boiler and it was expected that her speed would be seven knots an hour. A special deck-house amidships was provided for scientific work, the after part of which forms the galley. A large laboratory designed for zoological work lies below the deck-house, and a very complete dark room adjoins it. While scientific researches of all kinds are to be carried on, the party is especially equipped for oceanographic and meteorological work. The vessel carries two large drums, each containing 6000 fathoms of cable, for trapping and trawling at great depths. The cable is led up on deck to a specially constructed 40-horse-power steam winch. There is also a specially constructed motor engine for reeling in the large kites, which carry meteorological instruments to great heights in the air. Besides this, there are nets of all kinds for taking plant and animal life from the sea, as well as apparatus for procuring seals and whales. Hourly meteorological observations will be taken during the entire time.

The master of the vessel is Capt. Thomas Robertson, of Peterhead, who has already been in the Antarctic regions and has had twenty years' experience in the Arctic. The scientific staff consists of six men. The leader, Mr. W. S. Bruce and Mr. Wilton, will carry on the zoological work; Mr. R. N. Rudmore-Brown is botanist; Mr. R. C. Mossmann, meteorologist and magnetist; Dr. Y. H. H. Pirie, geologist and medical officer; a taxidermist and artist also accompany the expedition. The *Scotia* sailed with thirty-seven people all told, aboard. Dispatches received from Madeira said that she had proved herself a good sea boat and economical of coal, but that she rolled heavily. Mr. Bruce does not intend to allow the *Scotia* to be frozen in the ice if it can be avoided, for in his opinion his purposes can be better accomplished if the ship sails free. There will be no landing party, as not sufficient funds were contributed. The length of time that the Bruce-Robertson party remain in the far south will depend entirely on what provision the Scottish Geographical Society may be able to make for it.

Rumors of Expeditions.—Mr. C. E. Borchgrevink took out citizenship papers in the United States in 1902, and according to rumor was to lead an expedition under the patronage of various authorities in the Smithsonian Institution, to explore the Antarctic regions. It was said that Capt. Adrien de Gerlache, who headed the expedition of the *Belgica* in 1897-99, was planning to lead another expedition into the Antarctic regions.

ANTHROPOLOGY IN AMERICA. The year 1902 witnessed a steady increase of interest in various departments of anthropologic science, especially in the United States. This interest was manifested partly in growing activity among institutions devoted to the science. The most noteworthy movement was the founding of the American Anthropological Association as a national organization designed to promote investigation and publication, and by these means, as well as by meetings, to bring the anthropologists of the country and the world into closer union. The initial steps were taken at Chicago during the Convocation Week of 1901-02; the association was formally founded at Pittsburg on June 30, 1902; and the first regular meeting was held in Washington during the Convocation Week of 1902-03. The timeliness of the movement and the recognized need for such an organization are sufficiently indicated by the fact that all the leading anthropologists of the country were practically united in its support. The officers chosen comprise W J McGee, of Washington, president; F. W. Putnam, of Cambridge, Franz Boaz, of New York, and W. H. Holmes and J. W. Powell, of Washington, vice-presidents; George A. Dorsey, of Chicago, secretary; Roland B. Dixon, of Cambridge, treasurer; and F. W. Hodge, of Washington, editor. At the Washington meeting an arrangement was effected whereby the publication of the *American Anthropologist*, the leading journal of its class in the western hemisphere and one of the foremost in the world, was turned over to the association. Other voluntary organizations have continued in vigorous activity both in this country and abroad. The Anthropological Society of Washington held bi-weekly meetings during 1902, except in the summer months, closing the year by the election of Miss Alice Cunningham Fletcher as president, Joseph D. McGuire and Walter Hough as secretaries, and P. B. Pierce as treasurer, with a strong corps of vice-presidents. The American Ethnological Society, domiciled in New York, held frequent meetings during the winter

months at which numerous papers and addresses were presented; the officers at the end of the year were Morris K. Jesup, president; General James Grant Wilson and Professor Franz Boas, vice-presidents; Livingston Farrand and M. H. Saville, secretaries, and George H. Pepper, treasurer. The section of anthropology in the American Association for the Advancement of Science held important meetings at Pittsburg June 30-July 3, 1902, and at Washington December 29, 1902, to January 2, 1903; in both meetings the American Folk-Lore Society cooperated, and in the second the American Anthropological Association also; and at them opportunity was given for the presentation and discussion of more than a hundred contributions to the various branches of the science of man. The Pittsburg meeting was held under the chairmanship of Dr. Stewart Culin, of Philadelphia, with Dr. George A. Dorsey as secretary; at the Washington meeting Dr. Dorsey was chairman, and Dr. Roland B. Dixon, of Cambridge, secretary. One of the notable events of 1902 was the session of the International Congress of Americanists held in New York October 20-25, primarily at the instance of the Duc de Loubat and under the special support of Mr. Morris K. Jesup. The committee on arrangements for the meeting included the leading American anthropologists, with Prof. F. W. Putnam as chairman, and Dr. M. H. Saville as secretary. The congress brought representatives from about a score of countries as well as from all sections of the United States; and some eighty communications relating to the anthropology and early history of the western hemisphere were presented and discussed. While Mr. Jesup was president and the Duc de Loubat honorary president of the congress, the international character was emphasized by having vice-presidents from different countries preside at the daily sessions. These vice-presidents were Juan B. Ambrosetti, for Argentina; Alfredo Chavero, for Mexico; Leon Lejeal, for France; Karl von den Steinen, for Germany; Hjalmar Stolpe, for Sweden; and F. W. Putnam, for the United States. Out of compliment to the country of meeting, most of the communications and discussions were in English (though French is the official language of the congress), while Spanish, German, and Swedish were used also, especially in the informal discussions which formed the most attractive, if not the most useful, feature of the congress.

The chief unofficial anthropologic serials in this country remain the *American Anthropologist* (New York), the *American Folk-Lore Journal* (Cambridge), the *American Antiquarian* (Chicago), and the *Proceedings of the American Association for the Advancement of Science* (Washington); but it is a sign of the times that an increasing number of articles prepared by anthropologists are produced in the standard magazines. The leading organizations and publications in which the science is fostered abroad are, as during past years, the Anthropological Institute of Great Britain and Ireland, with its quarterly *Journal* and the excellent journal *Man*; the Berliner Gesellschaft für Anthropologie, Ethnologie, und Urgeschichte, with its two serials, viz., *Verhandlungen*, and *Zeitschrift für Ethnologie*; and the *Société d'Anthropologie de Paris*, with its *Bulletin* and *Mémoires*.

The leading official institution devoted to researches concerning mankind in this country is the Bureau of American Ethnology, which has continued field researches among Indian tribes and concerning related antiquities in a number of States and Territories as well as in portions of Canada and Mexico. Noteworthy expeditions were those of Dr. J. Walter Fewkes, early in 1902 to Porto Rico and in the autumn to the same island and Haiti where interesting aboriginal remains abound and where certain aboriginal customs and institutions have been preserved; also that of Dr. Frank Russell, who in June brought to an end a residence of nearly a year among the Pima Indians of Arizona, in the course of which he gained important information concerning the industries, social organization, and beliefs developed under conditions of extreme aridity. The bureau has continued the publication of annual reports and bulletins, of which several volumes were distributed through the year. It remains unique among official institutions, though scientific men of both the British and German empires have striven for years to have similar work undertaken in their colonies and dependencies. Its nearest analogue was developed during 1902 under the title, Bureau of Non-Christian Tribes in the Philippine Islands; the office being modeled after the American Bureau by the Philippine Commission, and entrusted to the direction of Dr. David P. Barrows, formerly of California. During the year the bureau suffered the great loss, by death, of its founder and director, Major J. W. Powell. The important ethnologic and archæologic researches of the Jesup North Pacific expeditions have been continued vigorously. These expeditions, supported by Mr. Morris K. Jesup in connection with the American Museum of Natural History in New York, and conducted under the general direction of Prof. F. W. Putnam and the more immediate supervision of Professor Franz Boas, were designed primarily to trace evidences of ethnic relation between the peoples of northwestern America and northeastern Asia; but, in addition to throwing much light on the subject of immediate inquiry, they have

yielded abundant data relating to the characteristics of various more primitive tribes. Among the important contributions may be noted the records of observation by Professor Waldemar Bogoras; certain of his observations on ceremonies and traditions are startling, in that they seem to indicate conclusively a migration in relatively early (i. e., pre-Eskimo) time from America to Asia. Although these indications are directly counter to prevailing suppositions, they are in harmony with various other determinations; thus, our most definite knowledge of human migration across Bering Strait is that of the westward passage of a branch of the Eskimo during late prehistoric times; while several migration routes of birds cross the strait from breeding grounds in Alaska to winter feeding grounds stretching southward from Kamchatka. These indications are also in striking accord with certain inferences made during 1902 by Prof. O. F. Cook, of the United States Department of Agriculture, concerning the origin and distribution of cultivated plants, including the banana and perhaps the cocoanut; he finds evidence (not yet conclusive though highly suggestive) that the original home of these plants was in South America, and that they must have come under cultivation there before they were transported across the Pacific, where they were afterward brought under still higher cultivation. Some of the material obtained through the Jesup expeditions is published in the *American Anthropologist*, but the greater part appears in the two serials (*Memoirs and Bulletins*) issued by the American Museum of Natural History. Under the guidance of the head of the Department of Anthropology (Dr. George A. Dorsey), the Field Columbian Museum, of Chicago, has recently made important studies of the ceremonial life as well as the sacred objects of several tribes, notably, the Pawnee, Cheyenne, and Arapaho; those in the first named tribe being a continuation of researches previously carried forward by Miss Fletcher with the support of the Bureau of American Ethnology. Dr. Stewart Culin, of the Free Museum attached to the University of Pennsylvania (Philadelphia), also made important researches in connection with strictly museum work; many of his observations relating to games and gaming devices, which play so prominent a rôle in the lives of the more primitive peoples. Among the more notable advances of recent years is the establishment of a department of anthropology in the University of California through the benefactions of Mrs. Phoebe A. Hearst; and especially notable among the events of 1902 in anthropology are some of the results of the work in this department, including that of Dr. A. L. Kroeber and Dr. Roland B. Dixon on the distribution and characteristics of the aboriginal languages of the Pacific region, and that of Dr. Max Uhle on the antiquities of South America. The studies of Kroeber and Dixon throw much light on one of the more interesting problems connected with the development of our aborigines. It has long been known that while some four-fifths of the area of North America north of Mexico was occupied by tribes of only half-a-dozen linguistic stocks, the remaining one-fifth along the Pacific coast was occupied by tribes of fifty or more distinct stocks. Ethnologists were long at a loss to explain the singular persistence of the Pacific coast languages, and, while McGee three years before had detected an important factor growing out of the use of speech as the ostensible basis of social organization in many of the tribes, it remained for the authors named to discover linguistic evidences of actual differentiation of the stocks, presumably due (at least in part) to the abandonment of words connected with deceased individuals of the tribes. Professor Frederick Starr, of the University of Chicago, continued his researches in Mexican anthropology during 1902, and conferred a boon on critical students by the issue of an immense album of aboriginal types found in Mexico; the album being made up of photomechanically reproduced portraits, in full face and section, of carefully selected types, all on the natural scale, i. e., life size. The year witnessed also another notable contribution to the anthropology of the neighboring republic in the two-volume work *Unknown Mexico*, by Dr. Carl Lumholtz. Primarily this is a record of five years' exploration in the less known districts of Mexico, yet it contains one of the fullest and most sympathetic accounts ever written of the social customs and ceremonial observances of primitive peoples. A large body of material for a prospective contribution to knowledge of the aborigines of Mexico was gathered during 1902 by Dr. Ales Hrdlicka in the course of extensive journeyings in which he visited several surviving tribes, collecting anthropometric data as well as photographs and osteologic material.

The recognition of anthropology in the higher institutions of learning continues to make satisfactory progress. Most universities begin with the introduction of special branches, usually those connected with social and economic problems, less commonly with those connected with physical anthropology and hence with biology; but several leading universities now have more or less definitely established departments of general anthropology. Prominent among these are Harvard, Columbia, California, and Chicago, all of which have become centres for active diffusion of the science.

ANTIGUA. See LEEWARD ISLANDS.

ANTIMONY. The mining of antimony ores in the United States received a severe check during 1902 by a tariff decision that placed crude antimony (partially refined sulphide) on the free list. Following this decision the single producer of refined antimony from domestic ores in the United States closed its works, and it is probable that operations will not be resumed so long as the present conditions continue. The supplies of antimony are derived from imports of the metal and from foreign ores that are smelted and refined in this country. See MINERAL PRODUCTION.

ANTITOXIN. Since the benefits of antidiphtheritic antitoxin (the first to be employed) became known, several other serums have been prepared. Among these are serums for dysentery, scarlet fever, snake bite, pneumonia, exophthalmic goitre, typhoid fever, bubonic plague, whooping cough, erysipelas, and streptococcic infections. The value of antidiphtheritic antitoxin in saving life is now universally admitted, and during 1902 much fresh testimony as to its worth was gathered. Thierry and Bertail, of France, report a series of 79 cases of diphtheria treated with the serum, with only 2 deaths; and in Berlin its use resulted in the lowest death rate from this disease ever recorded. Professor Behring's serum is employed in all but one hospital. Prior to its use the number of deaths from diphtheria was from 1300 to 2600 a year, while in 1901 the number was only 469. Antitoxin has also been tried in other diseases. In croupous (lobar) pneumonia reports as to its effects have been conflicting, but on the whole favorable. In whooping cough, it has been tried by I. K. Konarzsherski, of Russia, who found that two or three injections of 1000 units each limited the disease to two weeks' duration, and prevented severe paroxysms of coughing. The antitoxin was found in addition to be a certain prophylactic against infection. See SERUM THERAPY.

ANTIVIVISECTIONISTS. See VIVISECTION.

ANTOKOLSKI, MARK MATVEYEVITCH, a Russian sculptor, died July 9, 1902, at Hamburg, Germany. He was born in 1842, in the ghetto of Vilna of poor parents, and received only meagre education. When a child he evinced wonderful skill in making clay images, and although the Jewish religion does not encourage this form of art he was apprenticed to a marble cutter. At the age of twenty-two he was admitted as a free "listener" to the Academy of Fine Arts in St. Petersburg. He soon produced the original studies including "The Jewish Tailor" and "A Dispute over the Talmud," which won him a gold medal and the means to study in Italy for three years. "Ivan the Terrible" was completed in 1871 and raised him to the rank of an academicien. Among his other great pieces may be mentioned "Peter the Great" (1872), "Christ Before the People" (1874), "The Death of Socrates" (1876), "Spinoza" (1882), "Yermak" (1900), and one of his earlier works, "The Inquisition," representing the appearance of an inquisitor among the Spanish Jews observing a secret holiday. He was recognized not only as a national, but as the first of Russian sculptors. Realism was his fundamental principle, and he followed neither school nor master, but was always absolutely original. He suffered much from neglect in Russia, and the anti-Semitic press was very hostile to him, but at his death his genius was fully acknowledged, and all the leading newspapers and societies of St. Petersburg were represented by committees at his funeral.

ARABIA, a peninsula in southwestern Asia, has an area estimated at from 1,000,000 to 1,230,000 square miles, and a population from 4,000,000 to 12,000,000, the lower estimates for inhabitants being probably more nearly correct. Politically the peninsula may be divided in four parts: Turkish territory, comprising the vilayets of Hedjaz and Yemen on the Red Sea, while a strip along the Persian Gulf as far south as Oman is nominally under Ottoman authority; the sultanate of Oman in the southeast, independent but under British influence; Aden (*q.v.*); and the interior, which has not been annexed by any country and is largely unknown.

The estimated area of Hedjaz is about 96,500 square miles and its estimated population about 300,000; of Yemen, 77,000 square miles and 750,000. A railway is under construction from Damascus to Mecca.

The insurrectionary movements in Yemen, headed by Essid Hamid Eddin, continued against the Ottoman authorities in 1902.

The Red Sea Piracies.—Piracy in the Red Sea, which for some time had been of frequent occurrence, led to vigorous action on the part of Italy in the fall of 1902, while Great Britain entered protest against the neglect of the Turkish authorities to suppress this form of outrage. Italy's interest was aroused by a number of piracies in the vicinity of Massawah (Eritrea), and a naval demonstration at Hodeida followed. In the latter part of October three Italian warships, with a number of Turkish troops aboard, appeared off Midi, an island near the Yemen coast, whither the pirates had fled. A number of Italian dhows were attacked by the pirates and the Italian Commander Arnone shelled the island. Finally, on November 11, the Turkish authorities agreed to destroy or to hand over to Arnone

all of the blockaded pirate dhows; to punish those pirates who were Turkish subjects; within two months to deliver at Massawah such Eritrean pirates as Commander Arnone should designate; to suppress piracy in the future; to pay an indemnity of 15,000 francs to the families of two Italian sailors killed at Midî and one of 19,600 francs to Eritreans who had suffered loss from piracy; and to accord the same treatment to Eritrean dhows as to the most-favored foreign vessels. It was asserted that prior to the shelling of Midî the Turkish officials had connived at the crimes of the pirates, who were both robbers and procurers for the slave trade. Perhaps the most important phase of the whole matter was that Italy treated directly with the so-called rulers in Arabia rather than with the imperial authorities at Constantinople.

Koweyt.—During 1902 there was continued interest in the status of Koweyt as an important factor in the general question of the Persian Gulf. Koweyt, a town near the head of the gulf, is the capital of a small autonomous territory under the rule of Sheikh Mubarakh. Though claimed by the Turkish Sultan as a part of his domain, Koweyt is practically, though not technically, under the protection of the British government. In order to aid her in maintaining the political neutrality of the Persian Gulf and her supremacy in the trade of southern Persia, Great Britain has striven to preserve the existing status of Koweyt. Turkey is desirous of exercising administrative authority over the territory in the interest of her own revenue and, as seems probable, in order to make Koweyt a possible terminus for the projected Bagdad railway, which is largely a German enterprise. Russia also, in furthering her Persian policy, wants the port of Koweyt, and in 1902 two Russian consuls, on Russian ships, visited Mubarakh; he, however, seemed to stand firm in his preference for British friendship and protection, which according to British writers alone keeps the shores of the Persian Gulf from lapsing into anarchy. The feud between Mubarakh and Ibn Rashid, the ruler of Nejd (in the interior) continued during 1902. Against the latter also in that year arose Abdül Aziz bin Feysul, a descendant of the old Wahabi amers, who with about 2000 men captured by strategy the town of El Riad in February. A number of inter-tribal conflicts followed. In November, 1902, it was stated that the success of his Wahabi allies secured Mubarakh's position from invasion by Ibn Rashid, while he had little cause to fear any direct aggression from the Ottoman government so long as British ships remained in the vicinity of Koweyt. The chief danger at this time seemed to be in conspiracies fomented against Mubarakh in the neighboring Turkish territory. An attempted raid was stopped by a British warship in September. Although it is practically certain that this expedition was organized on Turkish territory, the Turkish authorities took no measures for punishing the offenders; indeed, the obstructive attitude of the vali of Basra seemed due to instructions from the Porte.

Oman.—In 1902 the ruler of Oman was the Sultan Seyyid Feysal bin Turki, who succeeded his father in 1888. A British political agent resides at Muscat, the capital. The annual revenue amounts to about 250,000 dollars. (The dollar is about equal to the Mexican dollar.) In the fiscal year 1901 the imports, chiefly rice and other provisions, arms and ammunition, and cotton goods, were valued at 3,365,883 dollars, and the exports, largely dates and mother-o'-pearl, 1,359,893 dollars. The trade is principally with India and Great Britain.

ARBITRATION, INTERNATIONAL. The year 1902 was a notable one in the history of international arbitration. This was manifested in the more general acceptance of the theory that arbitration is a practical means of settling international disputes; in the recognition of the principle of arbitration by the incorporation of clauses in several treaties negotiated, providing for its use in cases of dispute; in the large number of disputes decided by, or referred to, arbitration during the year; and, perhaps of the greatest importance of all, the utilization by some of the great world powers of the International Court of Arbitration at The Hague for the settlement of their difficulties and misunderstandings. It is significant that it was not until two American republics, the United States and Mexico, had set the example that the Old World powers, who have looked on the international court which they themselves helped to create with lack of confidence if not actual distrust, agreed to submit their differences to its decision. No purely European dispute was submitted to the arbitration, either of the Hague tribunal or other arbitrator, but before the end of the year Germany, France, and Great Britain had all recognized the court by agreeing to the submission to it of cases in which they were interested. Aside from this movement toward the utilization of the international tribunal, by far the most interesting development was the movement that found expression in numerous influential societies and organizations favorable to the conclusion of a permanent treaty of arbitration between Great Britain and France. During the year died one of the world's foremost advocates of international arbitration, M. Jean de Bloch (*q.v.*), of Warsaw, Poland.

The Pious Fund Decision.—On September 15, 1902, hearing was begun at The

Hague on the first case to be referred for adjudication to the International Court of Arbitration. The question at issue was that arising between the governments of the United States and the republic of Mexico over what is known as the "Pious Fund of the Californias." The history of the matter in dispute is as follows: The "Pious Fund" was established in the seventeenth century for the support of the Jesuit missions in both Upper and Lower California. When, at the close of the eighteenth century the Pope attempted to suppress the Jesuits, the administration of their estates and the mission fund was taken in hand by the existing Mexican government. After the establishment of the republic in Mexico, the new national government continued in possession, and agreed with the church authorities to pay them interest on the fund at the rate of 6 per cent. annually. As a result of the war between Mexico and the United States the Mexican province of California was divided, Mexico retaining the lower peninsula and the United States securing what is now the present state of California. After the restoration of peace the Mexican government, holding that the annual 6 per cent. interest which it owed should be paid only to the Catholic Church in Lower California, refused to continue payments for the support of such missions and congregations as lay in the region acquired by the United States. The United States government, on behalf of the Roman Catholic Church in northern California, contended that the payments should be continued to the church in that section, irrespective of the fact that the sovereignty of the region had been transferred. No agreement was reached until 1868, when a formal claim for a distribution of the accumulated interest was made by the Catholic diocese of California to the United States-Mexican Mixed Claims Commission, and by them referred to Sir Edward Thornton, British ambassador at Washington, for arbitration. In 1869 he gave his award declaring that the Mexican government was bound in justice and equity to pay to the United States the arrears of twenty-one years' interest upon one-half of the property in question. In accordance with this finding Mexico paid the sum of \$904,700 (Mexican), but after that refused to make further payments, denying that the award bound it for the future. The American contention has been that the award rendered the question at issue *res adjudicata* and settled once and for all the justice of their claim to one-half the property originally left to the Jesuits. After years of futile negotiations a protocol was finally signed at Washington by representatives of the two governments on May 22, 1902, by the terms of which the case was submitted to the Hague tribunal. The protocol provided that the arbitrators should first decide whether or not as a consequence of the former decision the claim was governed by the principle of *res adjudicata*. If it was, the contention of the United States was established. If not, the whole matter would have to be dealt with as though no decision had ever been reached in regard to it. The United States named as arbitrators M. de Martens, of St. Petersburg, probably the greatest living authority on international law, and Sir Edward Fry, formerly lord justice of the British Court of Appeal. The choice of Mexico fell upon Dr. Asser, the famous Dutch jurist, and Dr. Savornin Lohman, former minister of justice in the Netherlands. These arbitrators met in September and chose a fifth member in the person of Dr. H. Matzen, president of the Danish Landsting. Hearing was begun on September 15, the American case being presented by William L. Penfield, solicitor for the United States State Department, and Jackson H. Ralston, the Mexican case by M. de Beernaert, an eminent Belgian international lawyer, and Señor Pardo. The decision announced on October 14, 1902, was unanimously in favor of the United States, the finding of the tribunal being: (1) that the case was governed by the principle of *res adjudicata* in virtue of Sir Edward Thornton's decision; (2) that in conformity with that decision Mexico must pay to the United States the sum of \$1,420,682.67 (Mexican currency) to cover the arrears of interest from 1869 to 1902; and (3) that Mexico shall pay to the United States the sum of \$43,050.99 (Mexican) annually forever.

Other Cases before the Hague Tribunal.—The appearance of Mexico and the United States before the Hague tribunal seemed to give the nations renewed confidence in this new medium for the settlement of disputes, and it was announced at Paris on October 28, 1902, that Great Britain, Germany, France, and Japan had agreed to refer to the Hague tribunal the treaty clauses relative to perpetual leases under which foreigners are allowed to possess property in Japan. On November 12 it was announced that Germany had assented to the proposal made by the United States and accepted by other nations, to submit to the Hague tribunal the question as to whether the Chinese indemnity shall be paid in gold or silver. Both of these, however, it will be noted, concerned non-European disputes. Just at the end of 1902, what threatened to be the most serious international complication of the year, gave promise of a peaceful settlement, when Italy, Great Britain, and Germany agreed to submit their claims against Venezuela to the Hague court, a proposal to which President Castro of Venezuela consented on December 31. Late in December

a London paper stated that as many as seventeen cases would be submitted to the court in the near future, at least six of which were South American disputes.

American-Russian Sealing Dispute.—The award in the American-Russian sealing dispute was announced at Washington on July 1, 1902. The arbitrator, Dr. Asser, the eminent Dutch authority on international law, gave his decision in favor of the American contention. The United States asked indemnity from Russia for the seizure of five sealing vessels in 1891 and 1892, and an agreement arranging for the submission of the dispute to Dr. Asser was signed at St. Petersburg in 1900. Dr. Asser's award declares that the annual average catch should form the basis on which damages should be assessed, which was the exact contention of the United States. The exact amount of damages due from Russia was left for future determination. The dispute, although decided in accord with the code of the Hague tribunal, was not submitted to that body.

Other Awards, and Arbitration Treaties.—Among other awards of importance during 1902 were those of King Oscar, of Sweden and Norway, in the Samoan damage suits (see SAMOA); the award of a British commission in the Argentine-Chilian boundary dispute (see CHILE). Arbitration treaties were signed or ratified between Argentina and Paraguay, Argentina and Chile, and Bolivia and Peru. Articles providing for the settlement of disputes by arbitration were included in treaties negotiated during the year between the Netherlands and Germany, and between Denmark and the United States.

The Pan-American Conference.—At the Second International Conference of American States, generally spoken of as the "Pan-American Conference," which was held in the City of Mexico from October 22, 1901, to January 22, 1902, action of considerable importance was taken in regard to international arbitration, to which a greater part of the time of the session was given up. Of the twenty-three measures of various sorts passed, one providing for the compulsory arbitration of international disputes, incorporated in the form of an arbitration treaty, was signed by representatives of Argentina, Bolivia, Guatemala, Paraguay, Peru, Salvador, Santo Domingo, and Uruguay. A protocol declaring the adherence of the signatory states to the Hague conventions was signed by Argentina, Bolivia, Colombia, Costa Rica, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Paraguay, Peru, Salvador, Santo Domingo, Uruguay, and the United States. See MEXICO (paragraph Pan-American Conference).

Central American Arbitration.—A convention was signed at Corinto, Nicaragua, on January 20, 1902, by the presidents of Costa Rica, Honduras, Nicaragua, and Salvador, for the maintenance of peace in Central America, and the establishment of a permanent court of arbitration, to which the contracting states bind themselves to submit all difficulties and disputes that may arise between them. See CENTRAL AMERICA.

Lake Mohonk Conference.—The eighth annual conference on international arbitration was held at Lake Mohonk, N. Y., at the end of May, 1902. The conference was the largest in point of numbers thus far held, and the greatest interest was manifested in its sessions. Particularly noteworthy was the large attendance of prominent business men, who participated actively in the sessions, and discussed at length, the ways and means of enlisting commercial, mercantile, and industrial organizations in the movement for international arbitration. John W. Foster, former secretary of state, presided at the conference and delivered an address in which he reviewed the growth of the arbitration idea, and predicted its further development.

ARBITRATION, LABOR. The long continuance of the miners' strike in Pennsylvania in 1902, stopping the production of anthracite coal for some five months and causing widespread fear of a winter coal famine, brought about a renewal of the discussion in the United States as to the advisability, or, more correctly, as to the necessity of devising some method by which employers and employees might be compelled to adjust their differences. Mainly the argument in favor of this was expedient and ethical, and not of a kind recognized in the principles of Anglo-Saxon jurisprudence. It was said that the anthracite industry, like that of transportation, was basically of a *quasi* public nature; it had been built up and was sustained by the public, who bought and used the coal. The stoppage of production, like the holding up of trains or of the mails, affected the dependent public as much as, or more than, it affected either the employees or the capitalists concerned.

In other words, there were not two parties to the strike, but three, and the third party ought to be enabled, in its own interest, to declare a form of settlement binding upon the other two. But as to just what form this settlement should take there seemed to be no substantial agreement. Voluntary arbitration, whether conducted by the representatives of the employers and employees or by disinterested outside arbiters, would be open to the objection that it was likely to break down

precisely when most needed, and compulsory arbitration would seem, among other things, to violate the right of freedom of contract. Assuming, however, that by constitutional amendment or otherwise, the legal difficulty of compulsory arbitration could be overcome, there would still remain the rooted dislike to it of both employers and employees and the practical impossibility of forcing employees to work when they do not so choose, or of making employers hold capital invested against their will. Where great vested interests already obtained, as in the anthracite industry or in the large trunk line railways, no immediate discernible action by capitalists would probably result from a compulsory decree against their interests. Nevertheless fear of a recurring unfavorable decision would operate gradually to withdraw, or at least to prevent, an increase of the capital invested, and this action would be accelerated if the decision should operate to reduce returns below that in other industries. From the point of view of the employees, compulsory arbitration would, in the first place, tend to freeze out the non-union workers; for it would inevitably occur that the labor union leaders would come to represent all the employees and that the non-union workers, as isolated units, would have even less standing than at present with their employers, the latter being subject, as it were, to an arbitration board, before which only two bodies could naturally appear, that is to say, the employers and the organized representatives of the laborers. But a further objection and a much more germane one, especially in extensive strikes, involving great bodies of men, where alone presumably compulsory arbitration would be resorted to, would lie in the lack of hold that any decree would have upon a body so volatile as will as a labor organization. Unless the union were incorporated and were liable to legal dissolution, or suit for damages, or both, it might in case of acute irritation, and undoubtedly would, break with impunity an unfavorable ruling. But as was officially stated on a very opportune occasion by labor leaders, the unions are unanimously opposed to incorporation. The nominal reason given for this was that the judiciary by inheritance and training is prejudiced against labor and favorable to capital. The real reason, however, seems undoubtedly to lie deeper and to consist in the fact that in normal circumstances intimidation and the boycott are necessary to the successful issue of union strikes. But such intimidation and boycott, whether or not ethically justifiable, are unquestionably illegal and would uniformly so be held. Therefore if unions should incorporate they would not only throw away their most effective weapon in labor disputes, but would at the same time be obliged, as they are not at present, to feign acquiescence in the unfavorable arbitration ruling. The alleged but nevertheless doubtful success of the compulsory arbitration law in New Zealand, enacted in 1894, has even been brought forward as an example that the United States should follow. As the United States Industrial Commission, however, point out in their final report in 1902, the effect of such laws in a country of low industrial development can by no means be taken as indicative of their action in a country of highly complex and fully organized industries, running as a usual thing upon a comparatively narrow margin of profits. A further objection to arbitration *ex-cathedra*, whether compulsory throughout or whether both sides agree voluntarily to accept the decision rendered, follows from the ignorance of the arbiters of the subject matter in dispute. Where, as often happens, the questions raised relate to the interpretation and fulfilment of existing agreements or contracts, this ignorance of the industrial conditions affecting the dispute is not usually of moment, since the premises are clearly outlined; but where, as more frequently happens in strikes of considerable magnitude, the questions to be settled relate to future conditions of labor, and require for their determination a thorough understanding of all sides of the business, the arbiters lack the prime qualification of adjudicators. Neither side is likely to have confidence in the equity of any decision rendered; and the side defeated is fairly sure to protest against it. It has been noted, furthermore, as a rule of general application, that the weaker party to a trade dispute—the one that would naturally be picked out as the loser either because of relative weakness or on the merits of its contentions—is, in nearly all cases the only party that demands arbitration. In such an event the hope is relied upon that the arbitration board, out of general good feeling toward all concerned, will “split the difference”; that is to say, will grant part of the demands of the weaker party and effect a compromise greatly to the advantage of that party. A noteworthy example of the demand of this one-sided form of arbitration was that made by Mr. John Mitchell, president of the United Mine Workers of America, in 1902. For under conditions of the dispute, which were that definite and extensive concessions be made to the miners by the operators, the operators might lose and could not win by any decision rendered, and the miners might win and could not lose; hence the strategic plea of one party for the determination of the pending dispute by a body of disinterested men, and the sullen contention of the other party that there was “nothing to arbitrate.”

To a certain extent, the result that has attended the establishment of boards of

arbitration in various other States may be taken as indicative of the difficulty of devising any generally acceptable system of *ex-cathedra* arbitration. It is true that some of the boards have been poorly paid, appointed for political reasons, and vested with insufficient powers. Nevertheless their nearly uniform inefficiency is significant. Boards of arbitration have been created in the States of New York, Massachusetts, California, Colorado, Idaho, Illinois, Louisiana, Montana, Minnesota, Ohio, Utah, Wisconsin, New Jersey, Michigan, Connecticut, and Indiana. These boards usually consist of three members: one an employer, one an employee, generally appointed on the recommendations of labor organizations, and the other, a "citizen," i. e., a non-partisan. The board may act on its own motion and it may be invoked by authority of both parties to the dispute. Where both parties agree to submit their differences to the board, the decision is usually made binding. Generally the board has authority to summon witnesses, and if no settlement is reached, to publish a statement of the case fixing the blame for the dispute and indicating a proper basis of adjustment. In six other States—Pennsylvania, Maryland, Iowa, Kansas, Texas, and Missouri—which have no central boards, laws have been enacted authorizing the establishment of either temporary or permanent local and trade boards of arbitration. And in these six latter States, as stated by the Industrial Commission, the law seems to be a dead letter, and "in several of the States, whose laws provide for State boards of arbitration, they have never been actually appointed, while several other States have been almost absolutely inactive." Only in Massachusetts, New York, Illinois, and Indiana, the boards appear to have acted in a number of controversies with more or less success, and even in these States, the work of State boards of arbitration consists in practice, almost entirely, of mediation and conciliation—of uniformly conferring with the parties to disputes and influencing them to an amicable agreement between themselves. Very rarely are laws submitted to formal arbitration. In most cases, moreover, the intervention of the State board takes place on its own initiative without application of the parties, while in nearly all the remaining instances the application comes from one party only. It follows that the board can take steps towards mediation only after a strike or lockout has actually begun. And the Industrial Commission goes on to say that these limitations in the work of the State boards are to a considerable degree inherent, and that they cannot take the place of boards established within the trades themselves, readily acceptable, representing the employers and employees directly familiar with the prevailing conditions. The apparently utter failure of the State boards of arbitration would seem to indicate that the only feasible way of settling labor disputes is along the familiar line of joint conferences by the parties in dispute. An arbitrarily imposed tribunal with power to enforce its decrees would mean the annihilation of individual liberty, the enslavement of laborers, or the socialization of capital. Any of these is equally bad. Professor John B. Clark, of Columbia University, however, favors compulsory arbitration. In an article, "Authoritative Arbitration," in the December (1902) number of the *Political Science Quarterly*, he said: "If the question whether or not arbitration shall be insisted on is to be decided on broad grounds of equity, and if the rights of the public are to be considered, the reasoning which proves that we must have such arbitration is short and conclusive. The people have a right to continuous service. In enforcing this right they must see that justice is done between employers and employed. . . . We must provide every needed safeguard for the interests of employers and employed, but we must no longer allow them to rend society by their quarrels. . . . Wages kept down by the hardest action of competition we shall not tolerate. Wages sustained by crude force we are, within limits, tolerating. As between courts and mobs we are relying on mobs, but this is only because we have not ourselves proved the efficacy of courts. The evidence is in favor of their efficacy and there is little doubt that we shall ultimately have them." See STRIKES.

ARCHÆOLOGICAL INSTITUTE OF AMERICA. The regular annual meeting of the council was held in New York, May 10, 1902, and as usual the two preceding days were occupied with the meetings of the managing committees of the schools at Athens and in Rome. At that time the total membership of the institute was 1052, of which 135 were life members. Two members of the council, Professor James C. Van Benschoten, of Wesleyan University, and Professor J. Henry Thayer, of Harvard University, died in 1902. Two new societies, at Washington, D. C., and in Iowa, were organized, so that there are now twelve of these local subdivisions. The three schools affiliated with the institute in their annual reports show successful years, though the Roman school was seriously hampered by lack of funds, and the Athenian school greatly needed a permanent endowment for the continuance of its work. The School for Oriental Study and Research in Palestine had not yet had time to develop any settled policy, or to attract many students, but its success seemed assured, and it promised to prove of decided value to those who intend to specialize in Old Testament languages and related fields.

The fourth general meeting of the institute for the reading of papers was held during "Convocation Week" at Princeton, N. J., and proved thoroughly successful from every point of view. Thirty-one papers were presented, dealing for the most part with highly specialized topics from many different fields of archaeological study. Special mention may be made of Dr. Peters' account of the painted tombs at Marissa visited by him in July, 1902 (see *ARCHAEOLOGY*, paragraphs on Syria and Palestine) and Mr. Weller's report of his investigations on the Acropolis of Athens, which had enabled him to add much to our knowledge of the great gateway which preceded the present Periclean Propylæa.

The officers of the institute for 1902-03 are as follows: President, Professor John Williams White, of Harvard University; honorary presidents, Professor Charles Eliot Norton, of Harvard University, and Hon. Seth Low, of New York; vice-presidents, Charles P. Bowditch, of Boston; President Daniel C. Gilman, of the Carnegie Institution; Prof. W. J. McGee, of the Bureau of American Ethnology; Martin A. Ryerson, of Chicago; and Professor Thomas D. Seymour, of Yale University; secretary, Professor Francis W. Kelsey, of the University of Michigan; treasurer, James H. Hyde, of New York; editor-in-chief of the *American Journal of Archaeology*, Professor John H. Wright, of Harvard University. The American School at Athens has the following officers: Chairman of the managing committee, Professor James R. Wheeler, of Columbia University; secretary, Professor Horatio M. Reynolds, of Yale University; treasurer, Gardiner M. Lane, of Boston. For the American School in Rome the chairman of the managing committee is Professor Andrew F. West, of Princeton University; the secretary, Professor Samuel B. Platner, of Western Reserve University; and the treasurer, Cornelius C. Cuyler, of New York. The officers of the American School in Palestine are: Chairman of the managing committee, Professor George F. Moore, of Harvard University; acting secretary, Professor Charles C. Torrey, of Yale University.

ARCHAEOLOGY. The year 1902, like its immediate predecessors, was characterized by the active prosecution of exploration and excavation in the east as well as in classic lands. In the latter the work for the most part was on a comparatively small scale, and the results, though often of great interest to archaeologists, were not remarkable. An exception is of course found in the discoveries on Crete, so long closed to scientific exploration, where every report brings new evidence of the civilization and power of the rulers of the island more than three thousand years ago. In the east, the undertakings are more striking, as the discoveries are more likely to modify accepted views, and deal with persons and places better known by name. The most important single undertaking is perhaps the German exploration of Babylon, but Egypt still continues to occupy the largest number of excavators, and to yield the most generous returns. The results obtained or made public during 1902 can be most conveniently described in geographical order.

Babylonia and the East.—The chief place is naturally taken by work of the German *Orient-Gesellschaft*, for whom Dr. Koldewey is excavating the mounds that cover the site of ancient Babylon. Near the village of Jumjuma, in a group of mounds called by the Arabs Nischan-el-aswad, the Black Hills, was found a temple of Ninib or Adar, the patron god of the Babylonian physicians. This building, called E-sibatila, the House of the Shepherd of Life, was restored by Nabopolassar, father of Nebuchadnezzar, who deposited in it four copies of an inscription in which he refers to his revolt from Assyria, and ascribes his success to the special favor of Merodach. At El-Kasr the uncovering of the palace of Nebuchadnezzar showed that it consisted of a great number of small courts surrounded by rooms, united with each other and the great courts by corridors and doors. On one side of a large court was the great hall of the palace with three doors on the side of the court and a recess in the opposite wall. The decorations were peculiar in that they represented a row of columns with large volute capitals, though in the whole palace there is not a single occurrence of the column as an architectural member. Of course they were known to the Babylonians of the seventh and sixth centuries B. C., but for some reason they evidently preferred to use doors. Among the most striking results of the excavations are the reliefs in enamelled brick which formed the chief decoration of the walls. A large number of these ornaments including lions and other animals as well as merely decorative patterns had been put together from fragments, and at last a wall of twenty courses has been found with the glazed tiles still in place. The excavations have shown that the great palace was part of a plan for raising the general level of that part of the city as well as the great street of processions which led to the east. The palace was to cover the entire southern part of the city including the superseded palace of the king's father. The last report relates the discovery of the great gate of Ishtar, a strongly fortified post with towers, court and double gates. The walls are still 12 metres high, and covered with animals in relief. Excavations undertaken at Fara some distance to the south of Babylon led to the discovery of a very early

settlement, yielding stone knives and other primitive objects, including a number of tablets with a very ancient form of Babylonian writing. The place was evidently deserted early, as nothing belonging to the later civilization was found. The interest aroused in Germany by these discoveries has been increased by a lecture delivered in the presence of the emperor by Professor Delitzsch on *Babel and Bible*, in which he expressed very radical views as to the influence of Babylonia in the formation of the Hebrew religion. The publication of the lecture excited naturally a sharp controversy and the views expressed were vigorously attacked by the more conservative critics.

The University of Pennsylvania's excavations at Nippur were temporarily suspended, but the director, Dr. Hilprecht, was presented by the sultan with a great part of the tablets from the temple library which will now form part of the university's collection. The decipherment and publication of the thousands of documents here contained will occupy Assyriologists for many years. The gift was made in appreciation of Dr. Hilprecht's services in cataloguing the Babylonian antiquities in the museum at Constantinople.

The French excavations at Susa, conducted by de Morgan, brought to light many relics of the early time when Elamite invaders plundered Babylonia and brought the spoil to their capital. Among the booty was a stèle which King Hammurabi, a contemporary of Abraham, had erected in Sippora, containing a long code of laws for the government of the Babylonians. They show in general an advanced civilization and well-established legal forms, and furnish many interesting parallels to the Mosaic code; in particular the *lex talionis* is most rigorously enforced. The extensive trade and long journeys of the Babylonian merchant are indicated by the numerous provisions relating to the rights and duties of his wife and heirs in event of his failure to return within a reasonable time. A German version of the code was published by Dr. Winckler, and an English translation has appeared.

Susa has also yielded some interesting relics of the wars between the Persians and Greeks. A bronze astragalos contained a Greek dedication to Apollo in the alphabet of Miletus, and it can scarcely be doubted that it was part of the plunder of the famous sanctuary of Didyma, which Herodotus says was burned by the Persians under King Darius about 494 B. C. To the invasion of Xerxes seems due the presence of a Greek vase of the early fifth century, apparently a product of the time between the battle of Marathon and the capture of Athens, which may well have formed part of the booty of a Persian soldier.

Syria and Palestine.—The Palestine Exploration Fund after a year's delay at length obtained its firman from the Turkish government, and Mr. R. A. Stewart Macalister began work at Tell-*ej-Jezari*, long ago identified by Clermont Ganneau with the Biblical Gezer. The first campaign showed that the place was inhabited from very early times. Four strata were distinguished, of which the first is neolithic, while the other three belong to the bronze age. The fortifications of the town during these three periods can be definitely fixed, for on each occasion the circuit was extended, though the details of alteration and repairs cannot as yet be stated with certainty. Two places of burial were found. The first seems to have been used by the neolithic population for burning their dead, and the charred bones point to a non-Semitic race. Later the Semites of the bronze age used the cavern for interments. The other sepulchre was an old cistern, containing fifteen bodies and "the finest deposit of bronze weapons yet found in Palestine." Other remains belong to a megalithic structure in which human sacrifices of children seem to have been offered. Thus far the indications of date are confined to some scarabs and impressions belonging to the Middle Empire of Egypt about 2000 B. C.

At Taanach not far from Joppa the Austrians uncovered a Canaanite fortress and place of worship with a number of columns for sacrifice and some images, apparently of about the same period as the remains of Gezer. To a later period belongs a fortress of the type commonly attributed to King Solomon, in which were also idols and other objects connected with religion, including what is described as "an earthenware altar in the form of a throne adorned with cherubim and lions." The detailed account seems to show that the cherubim bear a strong resemblance to sphinxes. Still later this fortress was replaced by another, and finally, about the time of Haroun-al-Rashid, an Arabian castle was built on the hill.

Since August, 1900, a German expedition under the direction of Dr. Puchstein has been at work at Baalbek, where they have concentrated their attention very largely on the great temple of the sun, in whose court a Christian church and a Saracen fortress were later built. The greater part of this structure seems to be due to the Romans. The early centre of the worship was the great rock altar, around which the Romans built up platforms for a series of colonnades and courts. A flight of steps led to a great gateway, beyond which lay an hexagonal court forming an approach to the great court, in which stood the altar, with lustral basins on either side. Around the court was a great colonnade, facing a series of chambers.

Across the western end of the court rose the great temple; the excavation of which has not yet been reported. The so-called Temple of Jupiter has been repaired and secured against immediate danger of collapse, and the Round Temple, and a similar structure on Lebanon have been carefully studied with important results for the internal arrangements of these sanctuaries.

One effect of archæological activity in Palestine has not been wholly desirable. The natives have discovered that the objects found have a commercial value, and as a result a great deal of clandestine excavation, especially of tombs, is carried on. Needless to say, the objects found either find their way to the hands of dealers, who have every reason for concealing their provenience, or, if of no commercial value, are destroyed. At Tell-Sandahannah the excavations of Dr. Bliss have stimulated the natives to unwonted activity, and they have found the ancient necropolis containing many tombs of the Hellenistic period. Two of these were opened last summer just before the arrival of Dr. Hermann Thiersch, of Germany, and Dr. John P. Peters, of New York, who were thus enabled to examine and photograph or copy their decorations and inscriptions. Both tombs consisted of a sort of vestibule from which opened burial chambers, in which the dead were placed in niches or *loculi*. The inscriptions showed that one tomb contained at least six generations. Most interesting were the painted decorations, partly on stucco and partly on the stone itself. Prominent among them was a frieze of animals, in many cases with the names duly inscribed, showing an elephant, hippopotamus, crocodile, lion, lynx, and many others, for some of which the architect was indebted to mythology, while others seem to have been evolved from his inner consciousness.

Egypt.—Among the numerous excavations of which Egypt is now the scene, the first place seems fairly taken by the work of the German *Orient-Gesellschaft* at Abusir. Here, a little south of the Pyramids of Gizeh, are the pyramids and temples of the kings of the Fifth Dynasty. Though much smaller than the huge structures of the preceding kings, they are marked by very elaborate reliefs belonging to the very best period of the early Egyptian art. Moreover these kings were devoted worshippers of the Sun, and each regarded it as his duty to build a new temple to that deity, adorned with a great obelisk. One of these temples, erected by Ne-user-Ra (c. 2500 B. C.), occupied Dr. Bocharadt and his assistants from 1898 to 1901. Their investigations resulted not only in the complete recovery of the plan of the sanctuary, in itself a novelty in Egyptian architecture, but in the discovery of an extremely interesting and valuable series of colored reliefs, of which some relate to the founding of the temple, others to the celebration of the thirtieth anniversary of the king's accession, when the great obelisk nearly two hundred feet high was built, and a third series to the seasons of the year and the occupations and scenes, both in human life and in the world of nature appropriate to each. In 1902, work was begun on the excavation of the pyramid and temple for the worship of the same king. The approach which led from the valley to the temple was first cleared, which led through a gate to a court paved with basalt, on either side of which lay storerooms. From this court a door led into another court containing originally sixteen granite columns, made in imitation of the bundles of papyrus, of which fragments were found. Beyond the court was a long and narrow room with a niche at one end from which led a narrow passage. The actual shrine and the pyramid itself are to form the subject of next season's work. The small objects found are numerous and of great value for the history of Egyptian art. Around the temple is a mass of graves, partly those of the nobles who wished to be buried near the king, partly from the Middle Empire (about 2100 B. C.) belonging chiefly to priests and others connected with the temple service, and partly to later times. The latter are for the most part those of the poor inhabitants of the village near by. Later yet the Greek settlers used part of the graveyard. They followed the Egyptian burial customs, but used Greek decorations and buried articles of Greek manufacture with their dead. Here was found the most important classical papyrus of the year—a strip containing six columns from the lost *Persians* of Timotheus of Miletus, a poet of the early fourth century B. C., famed for his many musical novelties. More than two-thirds of the writing is well preserved, though the scribe has not been very careful and the text offers many difficulties to the commentator. The poem was a *Nomos* or solo to be sung to musical accompaniment. It deals with the defeat of the Persians at Salamis, and contains a comic element in a Phrygian who begs for mercy in exceedingly broken and incorrect Greek. At the close the poet appeals to Apollo against the Spartans in defense of his musical novelties, which included a cithara with eleven strings. The poem is the only work of the author and of its kind which we possess, and is also said to be the oldest Greek papyrus, belonging to the later fourth century, and probably not much more than fifty years later than the original publication.

For the Egypt Exploration Fund, Mr. Petrie turned his attention from the tombs

of the early kings at Abydos to the ancient town, and especially the great temple of Osiris, which has been hitherto very imperfectly known. The work proceeded systematically, but by the close of the year only the level of the Eighteenth Dynasty had been reached. The earliest structures are now under water till late in the spring, and their exploration promises to be very difficult and expensive. Two large tombs of the Twelfth Dynasty were also found containing huge sarcophagi of red granite; as they seem to have escaped the early plunderers, there is good reason to expect valuable discoveries when they are cleared. In fact the work of the past year was so promising that nine workers (an unusually large number) planned to take part in next season's campaign. The society's archaeological survey was continued by copying the scenes in the tomb of Aba, a Theban noble, at Luxor, and later by a very complete reproduction of the decorations in the tomb of Meryra, one of those to the north of Tell el Amarna. These are important, as they belong to the reign of Khuenaten (Amenophis IV.), the "heretic" king, in whose reign Egyptian art shows such unique characteristics.

For the Egyptian Research Account two new workers, Messrs. Caulfield and Christie, made a renewed study of the temple of Sety I. at Abydos; a site chosen so that these novices could have the benefit of the advice of Mr. Petrie. The excavations led to the discovery of the enclosing wall of the sacred precinct with a great pylon on the desert side from which a road led toward the tombs of the early kings. This has led to the belief that the temple was really the chapel to this cemetery, like the shrines in front of other royal tombs, and this view is confirmed by the long list of his predecessors which Sety inscribed on its walls.

At Naga ed Deir Messrs. Reisner and Lythgoe continued their work for the University of California by the careful excavation of a large necropolis containing a continuous series of graves from prehistoric times to the Eleventh Dynasty. At Bet Khallaf and Reqaqnah Mr. Garstan continued his study of early tombs of the Third and Fourth Dynasties with interesting results for the history of the architectural forms and burial customs. Near Thebes Messrs. Newberry and Titus have excavated the palace of Amenophis III. at Malgata, discovering a building not unlike in plan and decoration the celebrated palace of his successor at Tell el Amarna. Unfortunately the walls were very poorly preserved, and the chief artistic results were the painted floors.

For the later period the Græco-Roman branch of the Egyptian Exploration Fund has been represented as usual by Messrs. Grenfell and Hunt, who report a successful search for Ptolemaic papyri, partly at some sites in the Fayum, and partly at Hibeh, a little further south on the east bank of the Nile, where in mummies of the third century B. C. papyrus was frequently found used as a substitute for cloth. The first volume of the Tebtunis papyri has been issued jointly by the University of California and the Fund; it contains very little that is literary, but a very large number of interesting documents throwing much light on economic and social conditions during the later Ptolemaic period. A valuable appendix discusses the ratio of copper to silver during this time, and reaches the conclusion that, in the second century B. C., a copper drachma stood to a silver drachma in a ratio varying from 1 to 375 to 1 to 500; the old ratio had been considered 1 to 120.

Asia Minor.—Dr. Belck has continued his exploration of Cappadocia, visiting little known sites and collecting information as to the Hittite monuments of the region. Especial attention was given to the ancient Comana Cappadocia, hitherto considered a Hittite sacred place, but which proved to have no Hittite monuments, and is believed by the explorer to be a foundation of the Indo-European Cimmerians, dating from about the eighth century B. C. It is, however, on the coast that the greatest activity has been manifested, and at sites which have already been explored; Miletus, where Dr. Wiegand was still at work in 1902 for the Berlin Museum, Pergamum, where the German Archæological Institute, with Professor Dörpfeld as director, has entered upon a thorough exploration of the lower city, and Ephesus, where the Austrians under Dr. Heberdey are still at work.

At Miletus the excavations are beginning to show more satisfactory results than were possible at the outset, when the natural hindrances due to marshy soil and heaps of rubbish had to be overcome. The strong city walls with their towers and gates have been found in many places, and the road lined, as usual near an ancient city, with graves and sepulchral monuments has been traced on its way to the sanctuary of Apollo at Didyma. Within the city there seem to be two important discoveries. At the end of the Roman aqueduct has been found the great fountain on the Agora. It was two stories high, with elaborate architectural decorations and statues, of which many fragments have been found, enabling it to be restored in part. It seems likely that at least 18 were originally used. The reservoir was above, and water poured in cascades over the façade into a great basin, and thence overflowed into a smaller basin from which it could be drawn by the people. This is the first example of the great Roman fountains, to which the name *septizonium*

or *νυμφαῖον* is sometimes given. The other discovery is that of a large Agora south of the Bouleuterion. Its length is as yet uncertain, but its breadth is given as 120 m., and it was surrounded by a colonnade 14 m. wide, with a double row of marble columns from which open a series of large rooms, probably shops. The work here seemed likely to be suspended for a time, as the government did not propose an appropriation for 1903, preferring to support at present the more promising work at Pergamum, a site for which, since their excavation of the Great Altar and the Acropolis, the Germans have rightly felt a special responsibility.

For this place we now have a full preliminary report of the work which has been carried on during September, October, and November for three years. Starting at the great south gate in the city wall, which presents some unusual features due to its situation on a somewhat steep ascent, the excavators followed the course of the winding street which led up the hill toward the Acropolis. The street was well paved with large blocks, and beneath the surface were drains and water pipes. It led past an agora or market-place built on a terrace. The street passed along the substructures on the south and east sides, and here were stores in the basement. Entered on the upper level at the northeast was an open square surrounded by a colonnade behind which on the north, west, and probably east, were rooms for shops; Dorpfeld believes that the south side was an open porch for promenading and enjoying the fine view over the valley. On the north and west the buildings were two stories high, and from a rock-cut cistern further up the hill a tunnel brought water to a fountain on the north side. Three large rooms on the west are so well preserved that they have been roofed over and are now used as a local museum. Beyond the market-place the street was lined with buildings, which have not yet been excavated, and finally passed a large fountain, where the waters poured into a basin 21 metres long and 3.15 metres broad, and covered by a heavy roof supported by two rows of columns. Near by was a curious gateway in the form of a quadrant, from which two doors and steps led to higher terraces. These were obviously connected with the gymnasium of the city. The lower terrace seems to have contained the training school of the boys; on the second terrace was a Corinthian temple whose walls had contained many inscriptions; while on a third terrace above was the great gymnasium of the young men, built in Roman times, and already identified by Carl Humann. It is to this quarter that the next campaign is to be directed. Among the numerous inscriptions is one of peculiar interest. It is a copy of the royal ordinance which defined the duties of the *Astynomi* and of the public in regard to the public ways and places. The law requires the officials to see that the streets are not obstructed, and to enforce the regulations regarding repairs and cleaning. It seems that these charges were assessed upon the abutting property owners. The repair and use of party walls are regulated, and provision made to prevent injury to a neighbor's rights. The commissioners also had charge of the public fountains, and it is expressly forbidden under heavy penalties to use them for washing or for watering cattle. In another inscription a Roman emperor, probably Hadrian, regulates certain disputes which had arisen between the traders and the city bank, which alone had the right of changing money, and fixes a definite commission.

At Ephesus the work has centred on the system of streets in the part of the ancient city near the harbor and the theatre. About the latter very little has been reported, as a complete publication of the whole building is shortly to appear. The systems of streets investigated were late Roman, and satisfactory evidence that they were over the streets of the earlier city was lacking. The chief street, leading from the port to the theatre, is shown by an inscription to have been called the *Arcadiane*, and must have been named in honor of the emperor Arcadius (395-408 A. D.). It was about 11 metres broad, and well paved. On either side were colonnades about 5 metres wide, and back of them doors opened into shops. The testimony of an inscription shows that there were arrangements for lighting it at night. Two streets seem to have run parallel to it, and a third crossed it at right angles. The building which has hitherto figured as the "large gymnasium" is now proved to have been the "Baths of Constantine." It was connected with the *Arcadiane* by a fine open place, with colonnades on three sides, and three doors opening on the street. Among the lesser objects discovered were some fine remains of Ionic architecture, apparently belonging to an altar, and with them a relief containing the upper part of the Amazon of Polyclitus.

To Asia Minor may also be reckoned the islands immediately adjacent, and on two of them important excavations have been begun, though detailed reports have not yet appeared. At Cos, Dr. Herzog has at last found the celebrated sanctuary of Asclepius, scarcely second to Epidaurus as a place of healing. The temple was 30x17 metres, and it is said the architectural remains are sufficient to show all the details; there are, however, no traces of the pediment sculptures. The complete ex-

cavation of the sacred precinct is likely to be a long task. At Samos the Greek Archæological Society has secured permission to excavate the famous temple of Hera, and in the first season's work has satisfactorily determined that the temple was decastyle, and 109 metres long by 54.5 metres broad. It is also said that there were three rows of columns across the ends and two along the sides.

An important publication of the year has been the first part of the *Investigations at Assos, Plans, Drawings, and Photographs* (Cambridge, 1902), made by the American expedition to Assos twenty years ago. Two earlier reports have been issued among the papers of the Archæological Institute of America, but this at last shows in satisfactory form the important results of the first expedition of the institute. The brief text is by Francis H. Bacon, to whom many of the plans and architectural drawings are due. This part includes the agora, stoa, and bouleuterion, while four more parts will contain the account of tombs, baths, theatre, and walls, as well as the lesser objects. With this must be named the final and authoritative account of the long series of excavations at Troy, which closed in 1894. *Troja and Ilion*, by William Dörpfeld, with many collaborators (Athens, 1902), must always remain the official record of this work, though the interpretation of the results will doubtless continue to call forth discussion.

Crete.—The chief excavations on the island have been those carried on by the English Cretan Exploration Fund at Cnossus, by the British School of Athens at Palæokastro, and by the Italians at Phæstos. At the latter place the exploration of the Mycænæan palace has been continued with better results, so far as decorations and smaller finds are concerned. The palace was a large building extending over various terraces, with fine cut stone walls and broad staircases. The plan is naturally somewhat complicated, but shows analogies to the larger buildings at Cnossus. It was built over an earlier building, for beneath the floors were found walls and passages choked with rubbish, but showing through the characteristic pottery that they belonged to the pre-Mycænæan, "Kamarais" or Minoan period. From this palace the Italians turned to the necropolis, which, however, turned out to be chiefly of the later geometric period, though their native superintendent did discover twelve tombs with a fine collection of bronze swords, vases, and other objects belonging to the very end of the Mycænæan period. Still later they turned their attention to another summit of the ridge on which Phæstos lies, near the modern chapel of Hagia Triada, and here came to light another smaller Mycænæan palace, containing two shrines with many votive offerings, five inscribed tablets, many seals, and a very fine steatite vase with decorations in relief, representing a procession with music and dancing, which has been variously interpreted as a triumphant return from war or a harvest home. Some of the rooms of the palace contain well preserved frescoes, representing animal life.

At Palæokastro, Mr. Bosanquet had a site in eastern Crete which for some reason was abandoned after the fall of the Mycænæan power. He was fortunate in discovering a Mycænæan town of some size, and near it a group of better houses, one of which was fully cleared. It was at first only one story high, but later a second story reached by two staircases was added and the lower rooms used in part for storage. Near by a cemetery was excavated, throwing much light on the burial customs of the people, which seem to have differed somewhat from those in vogue on the mainland. The bodies seem to have been disinterred after a time and the bones collected in clay chests, while in one place there was an enclosure surrounded by a wall and divided into compartments, each containing a mass of skulls, bones, and vases, apparently in complete confusion. The vases were of the Kamarais type, so that this seems to represent the pre-Mycænæan custom.

At Cnossus the work of excavating the palace of Minos is still continuing, largely at the expense of Mr. Arthur Evans, as the subscriptions to the Cretan Exploration Fund are far short of what is required. The discovery of staircases and colonnades, which need to be supported or repaired, makes the work one of great difficulty, though the results more than pay for the trouble. This season has added a new series of rooms on the eastern side, but the end is not yet. The palace was provided with an elaborate system of drainage, including sanitary conveniences, with pipes for flushing, and stone shafts leading from upper stories to sewers below the surface. At last a shrine has also been found containing an altar with the sacred horns, between which was a small double axe, and a clay image of a goddess with a dove upon her head. As in the other images of this period, the lower part of the body is a cylinder. More frescoes have been found representing plants, and also a painting representing fish swimming. A whole series of porcelain plaques contain a representation of a town, and though much damaged it is clear that there were houses with two or three stories, and windows containing frames which must have contained some substitute for glass. Ivory figurines of very graceful carving are a new form of Mycænæan art. Many more inscribed tablets have been found, and Mr. Evans is confident that the numerical system is at last intelligible. The Oxford University Press has

had cast a set of types so that the inscriptions may shortly be printed in approximate facsimile.

Greece.—The attention of the Archæological Society and the foreign schools has been largely directed to works outside of Greece proper, and the most important of these undertakings have already been described. The Greek Society is very active in the establishment of local museums and the preservation of the local antiquities. The report (*Praktika*) published in 1902 shows that in 1901 work was carried forward at eleven different places, though in none on a large scale. The chief excavation now in progress is at the Heræum on Samos, but a very extensive scheme for the restoration of ancient monuments is planned. The repairs on the Parthenon having been completed, the scaffolding has been moved to the Erechtheum, where it is proposed to rebuild the Ionic porch on the north, and replace the half-columns of the west front. These portions of the temple were ruined during the War of Independence, and the material for the most part is now on the ground. New material, steel trusses and iron bolts, are to be used only when absolutely necessary. The principle involved is one already accepted, for a good deal of the present building is due to repairs made in 1844 and 1846, while the little temple of Athena Nike was entirely rebuilt from the material found in a Turkish bastion. The names of the committee who recommended the new work are a guarantee that nothing rash is proposed, and there seems no good reason why the results should not be satisfactory. The Ephor-General Kavvadias has also begun the restoration of the temple of Apollo at Phigalia, where the walls, overthrown by earthquakes, can be easily rebuilt. The society intends likewise to reconstruct the great Lion of Chæroneia, which marked the spot where the sacred band of Thebes made their last stand against Philip of Macedon. The monument survived until the last century, but during the War of Independence was blown up by a Greek leader who believed it contained treasure. As the fragments lie almost where they fell, the work of restoration should be easy. Other works which the society has in view are the complete excavation of the great temple enclosure at Athens sacred to Olympian Zeus, and the removal of the masses of earth which were thrown outside the walls of Mycenæ during the excavation of the citadel. When these plans have been carried out, and the excavations at Samos and elsewhere completed, a great archæological congress is to be held at Athens.

The French School has now completed its work at Delphi, and is engaged in arranging the museum and clearing away the debris from the ruins. Members of the school, however, have been active at several places. At Delos the heaps of rubbish which were piled up in the sacred enclosure are being removed, and back of the "small portico" an agora, surrounded as usual by a colonnade on the other three sides, has been cleared. At Tenos H. Demoulin has found the temple of Poseidon and Amphitrite surrounded by many other buildings, and has in his first campaign secured a number of inscriptions and some interesting sculpture. More important apparently are the results at Argos, where the low hill anciently called *Aspis* (The Shield) has been explored, and remains of walls and houses of a very early, apparently pre-Mycenæan period, discovered. The cyclopean walls, and also a Greek wall forming part of the later fortifications of the city, have been traced. Tombs of the Mycenæan period have been found between the *Aspis* and the lofty Larissa, and there are reports of a senate-house, and small temple with inscriptions relating to the worship of Apollo, as well as terra-cottas, vases, statuettes, and other small finds.

Besides the work at Pergamum, Dr. Dörpfeld has continued his work at Leucas, which he regards as the Homeric Ithaca, and has at last found traces of a considerable prehistoric settlement, and an ancient conduit through which water was brought in earthenware pipes, recalling the fountain near the palace mentioned in the *Odyssey*.

The chief excavations in Greece are, however, those of the American School at Corinth, where the campaign of 1902 has been better rewarded than that of the preceding year. The work this season continued from the beginning of March to June 14, an unusually long period, and cost \$3200, for which, as usual, it was necessary to depend on private subscriptions. On the south side of the temple hill a Greek stoa, some 350 feet in length, was cleared. The back was formed by a retaining wall of the temple terrace, and in some places the rock was cut away to make room for it. It was provided with a double row of columns, Doric in front, and half as many Ionic columns in the interior. The architectural remains are sufficient to make possible a complete restoration on paper. In later Roman times a row of vaulted chambers opening on a new portico was built in front, and for these the remains of an old Greek building furnished a foundation. At the east of the temple hill was found another similar row of chambers, at right angles to those on the south, and back of them up the hill was an open space bordered by a very late stoa. Under this building were found the foundations of a much older Greek stoa of great size. Beneath these buildings were several conduits for water, and in one of them were

found about 200 lamps, many of them with inscriptions. The small objects include bushels of early pottery, a large number of figurines, some of which are fine examples of archaic art, and a number of inscriptions, including one of the sixth century B.C. in the local alphabet. As heretofore, these results have required enormously deep digging and the removal of large masses of earth. A trial trench at the theatre resulted in the discovery of a complicated series of walls at a depth of more than twenty-five feet. It is planned to attack this building as a part of the next season's work, provided the necessary funds can be secured.

An earlier undertaking of the American School is recalled by the appearance of *The Argive Heraeum*, by Charles Waldstein and others (Vol. I: Boston and New York, 1902), containing an account of the excavations on that site from 1892 to 1895. This volume contains the general account of the excavations and detailed discussion of the geology of the region, and the sculpture in marble, the architecture and the inscriptions, with a large number of very fine plates. The second volume is to follow soon, and will contain the vases, terra-cottas, bronzes, and smaller articles generally.

Italy and the West.—In this region the reports for 1902 are a decided contrast to those from the East, and to those of earlier years. Not that there has been any decrease in activity, for the *Notizie degli Scavi* of the Italian government bear witness to numerous undertakings, and the French, Germans, and English are not neglectful of ancient remains within their borders. The results, however, are by no means sensational, and very few striking discoveries have been made. In Italy the prehistoric period has received additional light by the opening of tombs at many places, notably at La Pretara, near Attri, where were found three groups containing objects of bronze and iron, and a series of rather poor vases, chiefly remarkable for their large number of handles. At Torre Annunziata, a coast suburb of Pompeii, excavations brought to light a portico and shops, with many small articles and a number of skeletons. The discovery of a fine bronze statue representing a seated Heracles, and probably to be referred to the time of Lysippus, has also been reported from this region. In Pompeii the houses recently opened, though containing some interesting paintings, have not yielded any very striking objects. In Rome itself the work at the Forum has continued, especially about the temple of Castor, which has proved to be peripteral, and in the Atrium Vestæ, where more traces of the older house have been discovered. The earlier course of the Sacra Via has been further traced, and it now seems clear that its line was altered somewhat by Hadrian to make room for the temple of Venus and Rome. Much interest was aroused by the discovery between the temple of Antoninus and Faustina, and that of Romulus, son of Maxentius, of three prehistoric graves, the first ever found in this vicinity, and probably belonging to the necropolis of the early settlers of the Palatine. The first found contained a large urn or *dolium*, with a conical lid, and in this a "hut-urn" containing the ashes and several rude vases. The other graves were similar, and all resemble in all essentials the early cemeteries of the Esquiline and the Alban mountains. There is nothing in these discoveries to cause any surprise, and the accepted views as to the early settlements on the Roman hills are merely confirmed, but not modified, by the finding of another necropolis. Two publications of interest in Roman archæology are the work of Maurice Besnier, *L'Île Tibérène dans l'Antiquité* (Paris, 1902), and the first volume of the *Annual* of the British School at Rome. The former contains a very full history of the island where the Romans established their temple of Æsculapius, and of all its antiquities, together with a valuable bibliography. The latter contains a full discussion by Mr. Rushforth, the director, of the Church of St. Maria Antiqua, built about 600 A.D., and its ancient paintings, which are divided into groups, the earliest contemporary with the building, and the latest belonging to the end of the eighth century. The church is on the site of an earlier building, perhaps connected with the entrance to the Palatine, while the paintings show that they were executed when Rome was artistically a Byzantine city. In the same volume Mr. Ashby presents a monograph on the ancient roads through the Campagna and the monuments which line their sides. Of unusual importance is the publication of vol. I. of the *Storia degli Scavi di Roma*, by R. Lanciani (Rome, 1902), in which the history of the excavations, discoveries, and of the plundering and destruction of the ancient monuments has been compiled from the original documents preserved in many public and family archives, by one who for twenty-five years has devoted himself to these researches. In the present volume the period from 1000-1530 A.D. is treated, and four more volumes are to bring the narrative to the overthrow of the Papal government in 1870.

In Tunis the chief activity seems to have been at Carthage and Dougga (Thugga). At the former an early Punic necropolis has been found, yielding much information as to early Carthaginian burial customs; near by was a whole series of potters' ovens, one of which was almost entire, and made clear the methods used in producing the early vases. A later necropolis contained a series of burials from the

third century B.C. to the capture of the city by the Romans (B.C. 146). Here also the Odeum was excavated, and proved to be of very large size, with a rectangular stage and semi-circular *cavea* for the spectators. Among the discoveries of artistic value are some marble sarcophagi, some adorned with paintings, and one said to be sculptured in the style of the best Greek art. In one case the coffin was nearly full of resin, in which the corpse had been preserved. The French government has published a systematic account of the ancient monuments in Algiers, written by S. Gsell, the very competent director of the Museum, and entitled *Les Monuments Antiques de l'Algérie* (2 vols., Paris, 1902). Its full descriptions and authoritative treatment of the whole subject make this the standard work for this field.

ARCHÆOLOGY, AMERICAN. The year 1902 witnessed certain notable movements indicating a growing recognition of the importance of American archæology not only as a field of original research, but as a feature of general culture. Thus, the Archæological Institute of America has provisionally established a fellowship for American work, and has introduced lectures on this theme in its general courses; and, in connection with this expansion in its work, the Institute has enjoyed a decided development in activity, marked by the establishment of new branch societies as well as by increase in membership. Another movement of note was that toward the establishment of an International Archæologic Commission, designed to occupy the western hemisphere as its field. This movement originated at the Pan-American Conference held in the City of Mexico during the winter of 1901-1902. Largely at the instance of Dr. Alfredo Chavero, of Mexico, and Hon. Volney W. Foster, of Chicago, the conference adopted a resolution recommending to the several countries represented that such a commission be created on a basis analogous to that of the Bureau of the American Republics; the objects of the commission being (1) to work for the unification of laws relating to the preservation of antiquities in the western hemisphere, (2) to obtain and diffuse accurate information concerning such antiquities, and (3), if practicable, to obtain provision for a museum of international character. The Mexican government took prompt action on the recommendation. President Diaz designated Dr. Chavero as the representative of that country in arranging for the organization of the commission, and he visited Washington about the time of the International Congress of Americanists in order to confer with archæologists and other learned men from different American countries; and, pursuant to his recommendations, the consummation of the plan on the part of the American republics south of the United States was turned over to their several accredited representatives. Dr. W. J. McGee was designated through the secretary of state, as a similar representative for the United States. The plans of the commission were well advanced, though not matured, by the end of 1902. A fresh impetus was given to archæologic study by the International Congress of Americanists held in New York in October, 1902, and by the subsequent excursion of the participants to several points of archæologic interest—notably, the imposing antiquity in Ohio known as Fort Ancient. While this organization is devoted to the early history of America as well as to the study of the surviving aborigines and antiquities, it usually happens that archæology receives the lion's share of interest; this was conspicuously true of the congress in New York, where most of the students of archæology in America were assembled, and where about half of the fuller communications related to American archæology. The contributions concerning the antiquities of Mexico and Central America, as well as of Peru and Argentina, were especially rich and valuable.

Instrumentalities.—The chief instrumentalities for archæologic research are the public museums. The United States National Museum has continued collecting and classifying material from this and other countries, of which a large part relates to prehistoric man. Among the notable collections of 1902 were those made by Dr. Frank Russell in Arizona, in the course of his work as an officer of the Bureau of American Ethnology, and the various interesting objects obtained by Dr. J. Walter Fewkes in Porto Rico under the same auspices. The latter collection comprises several carved stone "collars" or "yokes" of well-known type, but of which the use has never been adequately explained. Some of the Fewkes specimens are carved with serpent symbols, and one or two are shaped in manifest imitation of serpent bodies; and this symbolism, agreeing as it does with devices on some of the "yokes" found in Mexico, aids in the interpretation of the objects. Many of the Mexican specimens are of the shape, and about the size, of an ox-bow (hence the designation "yoke"), so that the object forms an open loop, symmetrically carved, of diorite or other stone; the weight usually ranging from 25 to 75 pounds. The surface is sometimes plain, sometimes finely polished, sometimes carved with symbolic devices. The finest known specimen (in possession of Dr. Chavero, Mexico) is elaborately carved with the devices characteristic of aboriginal Mexican art, executed with such skill and delicacy as to give it rank among the finest products of native American sculpture. The Antillean specimens (including those collected by Dr. Fewkes) are usually closed, forming somewhat elongated annuli, whence the designation "collar,"

applied by early collectors. On putting together the various facts of symbolism and the meagre items of information concerning the ceremonial use of the objects, it is found that they represent what may be called the occidental crescent, i.e., that their symbolic meaning is akin to that originally underlying the oriental crescent, though the western symbol represents a somewhat earlier stage of development than the Indian and Arabian *yonı* and the crescent of the Turkish standard. Summarily, the object seems to be a symbol of fertility, or rather of fecundity, connected with corn and other plants, rain, the sun, the serpent, life, maternity, and other ideas of a long series closely associated in the primitive mind. Accordingly the objects were analogous in meaning and use to the rings employed in various aboriginal games, to the hair-whorls of Zuni maidens, and to various other mystical devices developed in the more arid districts of the western hemisphere; doubtless they were used in ceremonial invocations for rain and for the growth of crops, though the most decisive evidence of use was in connection with girls' puberty feasts. During the year the United States National Museum collections were rendered more accessible by the installation of a series of galleries; yet the building remains wholly inadequate—so that but a fraction of the material is accessible for study. The American Museum of Natural History (New York) has continued in rapid growth, and now stands among the foremost institutions of its class in the world. Among the notable archæologic collections installed during 1902 were those of Dr. Saville, from Honduras, and of Dr. Pepper and others, representing the Hyde expedition in Arizona; while the Jesup North Pacific expedition continued to yield abundant antiquarian as well as ethnic material. The Peabody Museum of Archæology and Ethnology (Cambridge) maintained steady growth; the Carnegie Museum (Pittsburg) was enriched by the addition of notable archæologic material, including certain beautiful specimens of aboriginal carving obtained by the director, Dr. W. J. Holland, from Mexico; the Field Columbian Museum (Chicago), through the efforts of Dr. George A. Dorsey, made particularly valuable collections of objects representing the transition from prehistoric to modern culture in California as well as among the plains tribes; the Free Museum (Philadelphia) gained rich collections under the direction of Dr. Stewart Culin; the Golden Gate Park Museum (San Francisco) continued the collection of ancient as well as modern Indian material; while the nucleus of the Hearst Museum, connected with the University of California (Berkeley), afforded opportunity for notable investigation as well as collection. Several State institutions gave attention to local antiquities, the surveys and examinations of mounds by Mills, under the auspices of the University of Ohio (Columbus), being especially valuable and significant. The Museo Nacional de Mexico increased its activity during 1902; Dr. Nicolas Leon, recently placed in charge of the department of archæology, installed a rich series of crania and other osteologic material (chiefly prehistoric) representing various districts of Mexico; while early in December Dr. Alfredo Chavero, distinguished as an archæologist no less than as a statesman and scholar, was made director of the institution. The museum connected with the department of education in Toronto (Canada), which is devoted chiefly to Canadian archæology, continued normal growth under the direction of David Boyle. Other institutions engaged in archæologic work are noted elsewhere. See ANTHROPOLOGY IN AMERICA.

Human Antiquity.—Various observations of the year 1902 served to renew discussion of the question of the antiquity of man in America. The most widely discussed discovery was that of the "Lansing man" in the bluffs of the Missouri River, near Lansing, Kan. Early in the year the Concannon brothers (farmers) found a human skull and other bones at a depth of over twenty feet from the surface, in a tunnel, or vault, excavated in a hillside to form a place of storage for vegetables and fruit. The skull was at first broken up and thrown out with the debris; but the occurrence came to the knowledge of Prof. J. H. Long, of Kansas City, who restored the cranium from the fragments, and afterward to that of Prof. S. W. Williston (then of the University of Kansas but now of the University of Chicago), Professor Haworth, and other geologists, who visited the locality and studied the associations. Professor Williston published a preliminary account, which led Prof. N. H. Winchell, State geologist of Minnesota, and Mr. Warren Upham, of Minneapolis, to make a more extended examination of the region about Lansing; and these geologists published their interpretations. Later, Profs. T. C. Chamberlin and R. D. Salisbury, of the University of Chicago, with Prof. Samuel Calvin, of the University of Iowa, and Prof. W. H. Holmes, of the United States National Museum, made a critical study of the deposits; while Dr. Ales Hrdlicka and Dr. George A. Dorsey examined and measured the cranium and other bones. All authorities are in agreement concerning the osteologic material; none of the bones are fossilized, and most of them are quite well preserved; and the skull is of the ordinary Plains Indian type in size, form, and other characters. The determinations of the age of the deposit by the geologists are, however, widely diverse; the discrepancy growing out of difference of opinion as to whether the deposit in which

the bones were found is original loess, undisturbed until the time of the excavation, or whether it is a secondary (redeposited) accumulation of material derived from the loess. The former view is strongly held by Winchell and Upham, who point out that, according to their determinations, the deposit agrees with undisturbed loess in chemical and mechanical constitution, and that it is continuous with the main body of that deposit as developed in the adjacent river bluffs; accordingly they correlate it with the closing stages of the Iowan epoch of the ice age—i.e., they assign it to about the middle of the Glacial Period. The chronology of the stages of this period is not, of course, measurable in years; but most geologists would agree that this determination would give the "Lansing man" an antiquity of somewhere between 10,000 and 75,000 years. On the other hand, Chamberlin, Salisbury, and Calvin agree in regarding the deposit as a secondary accumulation perhaps only a few centuries old; they find the materials to effervesce under acid less easily than those of undisturbed loess, indicating a less abundant element of undecomposed carbonate of lime. They also note the presence of rock fragments unlike those sometimes found in the base of the loess, and ascribe them to the agencies of redeposition; and the first named especially discuss the mechanics and known history of the Missouri River and its bottomlands, as well as the local configuration of the bluffs, with the view of demonstrating not only the possibility but the probability that the deposit in question was laid down as a sort of delta by the streamlet heading in the adjacent hills and now embouching through a narrow gorge into the Missouri a short distance from the excavation in which the remains were found. Pending agreement between the principals in the discussion or corroboration of one view or the other by extended independent studies, opinion as to the antiquity of the "Lansing man" is naturally held in abeyance; though the inertia of conservative thought, together with the harmony between the Chamberlin interpretation of the deposit and the determination of the characters of the school, favor the view that the remains are of no great antiquity. See GEOLOGY (paragraph Glacial Geology).

In connection with the congress of Americanists in New York, Professor Putnam brought together the human remains and artifacts collected at Trenton (N. J.) under his direction by Mr. Ernest Volk during several years of continuous work conducted through the munificence of the Duc de Loubat and Dr. Hyde, of New York. These attracted much attention. The deposits in which they were found are either late aqueo-glacial accumulations or later accumulations produced by winds or storms; while the depth at which most of the relics were found was so limited as to be within reach of surface disturbance. One of the relics, however, is of special significance because found at a considerable depth in apparently undisturbed deposits of later Glacial Age. This is a bone, apparently a human femur, which, although so far decomposed as to render the determination in some degree doubtful, appears to have been cut squarely across at one end, sharpened at the other end, and perforated about mid-length. The whole appearance of the object suggests that it was artificially shaped for use as a handle for some sort of cutting implement, or for attachment to the shaft as a harpoon head or javelin point. The object is specially noteworthy as affording the most decisive bit of evidence of high human antiquity in America thus far recorded. The geologic associations indicate that it antedated somewhat the last, or Wisconsin ice invasion of the Glacial Period, an epoch commonly estimated at from 6000 to 20,000 years in the past—10,000 years being a fair average of the estimates. Certain of the human crania found at Trenton are of much interest by reason of small size and other primitive characteristics; they were recently described and discussed by Hrdlicka, who shows that they do not correspond with the skulls of the tribes found in the same region by the earliest white settlers. On the whole the question of the antiquity of man in America must be regarded as far from settlement. So far as occurrences of human relics in geologic deposits of known age are concerned, the evidence of high human antiquity seems less decisive now than a quarter-century ago, chiefly by reason of the more critical weighing of details with increasing knowledge; yet it is significant that what may be called the ethnologic indications point to a greater antiquity of the American race than the geologic evidences thus far recorded. Thus (neglecting the Calaveras skull, which would, if the recorded associations could be verified, carry the peopling of America millions of years into the past), the most trustworthy geologic testimony—that of the Trenton femur—would carry man back not more than 10,000, or, at the maximum estimate, 20,000 years, and the extreme estimate of the age of the "Lansing man" is not much greater; while the conservative student of the native tribes, familiar with the slow advance of primitive peoples, finds it difficult if not impossible to conceive of the distribution of men over the American hemisphere, the development of a multitude of distinct tongues, the growth of industries adapted to every environment, the establishment of distinctive systems of social organization, and especially the development of numerous mythologic systems with attendant ceremonies and traditions running back through uncounted generations, within so short

a period as ten or twenty thousand years. Accordingly the condition of the question is such as to encourage research on the part of archæologists and geologists alike. See ANTHROPOLOGY IN AMERICA.

ARCHITECTURE. In the architectural record of 1902 the event that attracted the most widespread attention was the fall of the historic Campanile of Saint Mark at Venice, on July 14. Its collapse was not wholly without warning, and no lives were lost. The adjoining palace of the Library, Sansovino's masterpiece, was somewhat damaged, but the church of Saint Mark was wholly uninjured. The disaster was not due to faulty foundations, but to defects of construction and inadequate repairs; and the architect in charge, Signor Saccardo, who was promptly removed from office, declared that the responsibility for it lay with those officials who had ignored his warnings and refused to order the repairs he had persistently urged. The tower will be rebuilt in the form it has had ever since the alterations of the sixteenth century.

In the United States the year was distinguished by an extraordinary activity in building. In New York there were contracted for or completed during the year business buildings and apartment-hotels alone aggregating over \$75,000,000 in cost, while in other lines the record was almost equally remarkable. Never before were so many important buildings planned or erected in one year for the national government, both at Washington and elsewhere; while in the building of all sorts of public buildings and private residences the activity was remarkable, especially in the eastern, middle, western, and Pacific coast States (see BUILDING OPERATIONS). The general average of quality in all this architecture shows progress in taste, with few or no especially brilliant achievements to record. In sharp contrast with present European tendencies toward a veritable anarchy of caprice in design, the tendency in the United States has been in the main towards classic models freely handled. There was in 1902 an increased activity in the agitation for the artistic remodeling of our cities, of which the most conspicuous example is the Washington improvement scheme, projected in 1901, and vigorously urged in 1902 with fair prospect of official adoption. Indeed, the notable building for the Department of Agriculture (Lord and Hewlett) has already been assigned a site in accordance with the scheme reported by the commission, and steps have been taken for the removal of the Pennsylvania railroad tracks and station from the Mall to a new site, where a terminal, to cost \$5,000,000, is to be built from plans by D. H. Burnham. The governor of Ohio has appointed J. M. Carrère and A. W. Brunner, of New York, as experts to arrange for the planning of the new group of municipal buildings at Cleveland, O., in accordance with a somewhat similar project for municipal improvement; while in New York Mayor Low has consulted the Municipal Art Society with a view to appointing a commission to consider broadly the whole question of municipal improvement, and Bridge Commissioner Lindenthal has engaged a competent architect to collaborate with the engineers in the design of all the colossal new bridges across the East River now projected or under way. Important monuments have been erected or awarded in competition in many cities, notably in Philadelphia, which is to erect a great monument to her soldiers and sailors from competitive designs by Lord and Hewlett. In New York the soldiers' and sailors' monument on Riverside Drive, an ornate and dignified circular edifice, by C. W. and A. A. Stoughton, was dedicated May 30. An extraordinary number of public libraries have been projected or erected during the year in almost or quite all the States, the most conspicuous being the palatial New York Public Library, now actively under way on foundations laid in 1901 (Carrère and Hastings). The United States government has secured by competition under the Tarsney act several admirable designs for federal buildings, while those emanating from the office of the supervising architect, Mr. J. K. Taylor, display the results of efficient administration and good taste. Architectural enterprises for 1902 in Washington include a new municipal building (Cope and Stewardson), city hospital (F. M. Day), public library, railway terminal and buildings for the Department of Agriculture and the Supreme Court. In New York, among structures not already referred to, we may mention the new custom house (Cass Gilbert), Stock Exchange (G. B. Post), City College buildings (G. B. Post), forty branch libraries, lady chapels for the cathedrals of Saint John the Divine (Heins and Lafarge) and Saint Patrick (C. T. Mathews), begun in 1902; new wing of Metropolitan Museum of Art (Hunt and Hunt), Chamber of Commerce (J. B. Baker), "Flatiron building" (D. H. Burnham), three great department stores, several large hotels, and several palatial residences completed or in progress. In Chicago the chief activity has been in commercial buildings and private residences. The dilatory construction of the Chicago postoffice has caused dissatisfaction. At St. Louis progress has been made in the Louisiana Purchase Exposition (*q.v.*); in the buildings for which, chiefly of steel, staff, and glass, classic treatment predominates. There has been continued progress in taste and achievement in landscape gardening and formal gardening in the United States. The archi-

tectural profession has lost in 1902 by death in Philadelphia the veteran J. M. Wilson, A.I.A., and the talented Walter Cope (of Cope and Stewardson), perhaps the ablest of Philadelphia architects; at Washington, Edward Clarke, aged eighty, architect in charge of the Capitol for many years; and, at New York, James Brown Lord, architect of the Appellate Court and other important buildings.

In *England*, the year's record has been less satisfactory, owing in part to the effects of the South African war. Indignation is felt in London at the adoption of an unworthy design for the Vauxhall bridge, soon to be erected. The Liverpool cathedral competition brought out no strikingly able designs, and the advisers, R. Norman Shaw and G. F. Bodley, selected six architects for the final competition on the basis of their professional achievements rather than of their competitive designs. The cathedral will cost \$1,000,000, too small a sum for the best results. The new Roman Catholic cathedral at Westminster, by the late J. F. Bentley, has been externally completed and made ready internally for the decorators, at a cost of nearly \$2,000,000. It is modeled in plan after the domical churches of Charente; externally its architecture is strongly personal and eclectic, but the whole is admitted to be a noble monument to its lamented designer. The War office (Young) and Government Board buildings (Brydon) have not yet been completed. Competitions have been held for municipal buildings, or their erection begun, in many towns, as at Aldershot, Barry, Colchester, Creeve, Deptford, and Tottenham. The design of the Birmingham University buildings was awarded to Aston Webb and Ingres Bell, architects also of the Naval College at Dartmouth, and of Horsham Schools. The new Criminal Courts in the Old Bailey (E. W. Mountford), and the great electric station on Grove Road (Peach and Reilly), a strong and original design, were begun. Many important competitions were held, but often under conditions so unsatisfactory that a National Society was formed to promote their proper conduct and adjudication. The discussion as to the licensing and registration of architects has continued with no positive results. The annual gold medal of the Royal Academy in architecture was awarded to Mr. T. W. Collcutt.

On the *Continent of Europe* the most noticeable feature in the architecture of 1902 is the astonishing invasion of the so-called "Art Nouveau" into architectural design, producing results in most cases deplorably fantastic, and destitute of the fundamental qualities of repose, dignity and structural propriety. In the Düsseldorf exhibition (Hoffacker, Storck, and others) the vagaries of this freak architecture reigned supreme, and this was in a measure true of the exhibition at Olmütz, and the important Exhibition of Art and Industry at Turin, although here the work of Signor d'Aronco in the main building was sufficiently vigorous and thoughtful to save it from the charge of utter absurdity. In Paris, this species of anarchy in design has even been premiated in the annual award of prizes for the best façades erected during the year, in the eccentric façade by M. Lavirotte on the Avenue Rapp. The other prizes were for designs of a less bizarre character. The new Paris building act has relaxed the restrictions upon projections from the plane of the façade. The use of brick and concrete, reinforced by metal (*brique armée* and *béton armé*) in architecture has greatly increased in Paris, to the detriment of elegance and solidity of design. Two new bridges have been projected to be built across the Seine at Paris in 1903, at a cost of \$700,000. There have been no architectural enterprises of the first rank to be credited to the French in 1902.

Among buildings planned or completed in 1902 in *Germany* may be mentioned Conrad's High School for girls, at Wiesbaden, in a well-studied late Gothic style; at Munich the dignified and successful buildings for the new Northern cemetery, by Hans Grässel, in a modernized Byzantine style; and the new public baths by K. Hocheder, with an imposing swimming-hall. A competition for a monument to Bismarck brought out some admirable and vigorous designs; it was won by the architect, E. Schandt. The new Berlin Electric City Railway reveals, in the well-designed details of its construction and in several of its stations, some of the best results of the free modern treatment applied to structures of metal and masonry, in pleasing contrast to the extraordinary vagaries of the "New Art" in many of the new residences and public buildings. In *Austria*, the competition for the new Municipal Museum at Vienna resulted in the adoption of Schacher's design in preference to that of Professor Wagner. The announcement of a competition for a monument to the late Empress Elizabeth, and the Secessionist exhibition at Vienna, held in an extraordinary Art Nouveau building by Professor Hofmann, are worthy of mention. In *Italy*, the Turin Exhibition and the fall of the Venetian Campanile have already been alluded to. Italy has only to a limited degree experienced the Art Nouveau craze, which has run to such extremes in France, Germany, and Austria.

ARCTIC EXPLORATION. That vexed question as to which is the best route to the North Pole, the Smith Sound route or the Franz Josef Land route or the Bering Strait route, was not settled in 1902 after all. Expeditions were in the field to demonstrate the practicability of the Smith Sound route and the Franz Josef Land

THE NEW WHITE HOUSE BUILDINGS

route, but owing to conditions that had little to do with the routes themselves, the Pole still remains undiscovered. Neither route was fairly tested. Lieut. (now Commander) Robert E. Peary, who set forth to seek the Pole from the American side of the world, was prevented from accomplishing valuable results by the smallness of his party. On the other hand, Mr. Evelyn B. Baldwin, who attempted the adventure of the Pole by way of Franz Josef Land, was apparently hampered by bad material in his party and by insufficient equipment—although this item in his plan was supposed to be extraordinarily well cared for. In 1902 neither Mr. Peary nor Mr. Baldwin accomplished much in the way of adding to the world's information about the Arctic regions. The only explorer in the north who returned in 1902 with valuable discoveries to describe was Capt. Otto Sverdrup (*q.v.*), who was the commander of the *Fram* during Nansen's drift across the Arctic Ocean in 1893-95, and had set forth in the same vessel in 1898 to make explorations in Greenland waters. Reports of Captain Sverdrup's discoveries are somewhat vague in one or two details, but it is certain that the *Fram* party pushed through Jones's Sound to the west coast of Ellesmere Land and explored this coast north as far as the 81st parallel. Moreover, they discovered new islands of considerable extent lying above the Parry Islands, to the west of Ellesmere Land. The details of the expedition are as follows.

The West Coast of Ellesmere Land.—Captain Sverdrup started in 1898 in the steamship *Fram* to circumnavigate Greenland by way of Smith Sound. There were sixteen men in the party, six of whom belonged to the scientific staff. Among them were Lieutenant Isaachsen; Mr. Bay, zoologist; Mr. Simmons, botanist; Mr. Schei, geologist; Mr. Svendsen, surgeon. The *Fram* was checked by the ice in Kane Basin and was seen there by Mr. Peary in the summer of 1899, but for two years thereafter no news of her was received. There was some apprehension that she might be lost. The alternative conjecture was that she might have abandoned the plan of exploring upper Greenland and given her attention to Jones's Sound, which bounds Ellesmere Land on the south; and this conjecture turned out to be accurate. On August 22, 1899, having found it impossible to penetrate the ice in Kane Basin, Captain Sverdrup turned his ship southward. He entered Jones's Sound, established winter quarters on the south side of Ellesmere Land, latitude 17° 29' North, longitude 84° 24' West. He spent the fall in making preliminary boat journeys to the westward for the purpose of laying down depots of supplies to be used in a sledge journey in the spring. During the fall, in the absence of the captain, one of the party, Braskerud, caught cold while out hunting and died. On March 17 and 20, 1900, a sledge journey in two parties consisting of nine men set forth along the southern coast of Ellesmere Land, and proceeded until the 31st of March, when they had covered 175 miles. Here the supporting party, consisting of five members, returned to Björneborg, which was the name that had been given to the main depot of supplies. The other four men, composing two parties, each with supplies for fifty days, continued westward. Opposite North Kent they discovered a bay 100 miles broad, extending eastward into the coast of Ellesmere Land. The northern side of this bay was penetrated by deep fjords. Beyond the mouth of the bay, Ellesmere Land extends about fifty miles to the westward and then the coast turns north. At the 79th parallel, on April 16, the two parties separated; one, consisting of Isaachsen and Hassel, kept on to the west to explore new land that had been sighted. The explorers reached this land at the 98th meridian, whence they returned to the coast of Ellesmere Land and traveled southwards, discovering a system of fjords and exploring some of them. They returned to the ship on June 19, 1900. Meanwhile the other party, consisting of Sverdrup himself and Fosheim, had proceeded northward along the Ellesmere Land coast, which they found much broken by fjords, as far as the 81st parallel. They then returned to the ship, arriving on June 2. Also a third party, made up of Schei and Henriksen, had explored two minor islands lying north of Jones's Sound, and had made a journey to the northern end of North Kent. During the absence of the parties, the awning of the *Fram* caught fire from the funnel and ignited the mainmast. Kayaks were stored underneath the awning, as well as musk-ox skins and several bear skins, and these were burned. A water hole had been kept open alongside the vessel for such emergencies, and the fire was soon subdued. By the 9th of August the ice had broken up sufficiently to permit the moving of the *Fram*, and she proceeded westward as far as the 89th meridian and took up new winter quarters in a fjord (latitude 76° 48' North, longitude 89° West). The autumn was spent mainly in hunting. In the sledging season of 1901 two parties again set out: Isaachsen and Hassel westward, to explore the new land they had touched the preceding season; Sverdrup, Fosheim, Raanäs, and Schei to ascertain whether the northern coast which Sverdrup had investigated during the preceding spring was cut off from Ellesmere Land by a sound. The party that explored the islands to the westward discovered at about the 78th parallel a strait separating North Cornwall from the land situated to the north. They followed the southern coast of this land through the strait and northward to its limit

at latitude 79° 30' North, longitude 106° West. From this point no land could be seen either to the west or to the north. The party then turned eastward and, following along the northern coast of the new island, returned to Ellesmere Land and then to the ship, which they reached June 7, 1901. The new country is rather low as compared with Ellesmere Land—not more than 1000 feet at its highest point. Meanwhile Sverdrup's party became involved in fjords on the Ellesmere Land coast and reached only 80° 30' North. The *Fram* was not released from the ice during the summer of 1901, and in the season of 1902 Captain Sverdrup and Mr. Schei made a journey up the west coast of Ellesmere Land for the purpose of reaching the point that Lieutenant Aldrich of the Nares expedition had reached in 1876, but they failed to accomplish this aim by about fifty miles. The remainder of the sledging season of 1902 was spent in minor explorations. On August 6, the *Fram* left her anchorage and she reached Sweden August 29. The party was amply supplied with game during the whole time. Musk-ox, reindeer, and wolves and Arctic hares, abound in Ellesmere Land. Ice bears are numerous, and in the waterways walrus are abundant.

The Peary Expedition.—Lieut. (now Commander) Robert E. Peary (*q.v.*) returned from Greenland in 1902 and, not content with having made the most extended series of Arctic explorations ever accomplished by any single leader, including the discovery of what is perhaps the spur of land nearest to the North Pole, announced his intention of making another attempt to reach the Pole itself, provided that funds could be procured for the maintenance of a party. Commander Peary still believes in the Smith Sound route. In his "dash for the Pole" in 1902, however, he found himself unable to proceed beyond latitude 84° 17' North, mainly because of lack of men and the delay in starting across the sea ice, due to the fact that his headquarters were too far south of the Polar ocean. He spent the winter of 1901-02 at Payer Harbor near Cape Sabine. On March 3, 1902, an advance party of six sledges, under the command of Mr. Peary's colored servant, Matt Henson, started to transport provisions to Fort Conger, and on the 6th eighteen more sledges left Cape Sabine. From Fort Conger it was necessary to carry supplies to the edge of the ocean at Cape Hecla, and thus a difficult preliminary journey of more than 400 miles had to be accomplished before the explorer could leave the land—a journey that would have been unnecessary, had the explorer carried a party strong enough to establish a headquarters at the limit of solid ground. On April 1, with Henson, four Eskimos, and six sledges, the leader set forth over the rough ice of the Polar sea. After fifteen days, confronted with small floes, of which the edges were crumpled into mounds sometimes fifty feet high by the pressure of the pack, he was forced to abandon further advance. He reached Cape Hecla on April 24 and continued to Cape Sabine, where he arrived on April 29. The auxiliary steamer *Windward*, which had left Sydney, Cape Breton, on July 24, bearing Mrs. Peary and her daughter Marie Anneghito, reached Payer Harbor on August 5, 1902, took off the explorer and his party, and made way toward home the same afternoon.

During the winter an epidemic ran through the tribe of the most northern Eskimos, upon whom Mr. Peary relied as aids to his expedition. A large number of them died. Dr. Diedrick, who was released from the explorer's party in 1901, but remained in Etah on the Greenland side of Smith Sound so that the party might not be without the services of a physician, returned with the *Windward*, having lived with Eskimos during the winter. He announced that he had made one call on the explorer, and that food had been refused to him.

The plans for reaching the North Pole in future, as announced by Mr. Peary, are an evolution of schemes put forward at different times by various explorers: a headquarters on the furthest attainable land, supported by a line of caches down to the limit of regular navigation; a large supporting party to replenish the supplies of these caches and of the headquarters; and a dash with a light party over the ice floes. The new features of Mr. Peary's plan are a light pioneer party to go in advance of the main party, for the purpose of mapping out a route, and the use of Eskimos in the preliminary work. In fact, the explorer has in mind the redistribution of the entire tribe of Whale Sound Eskimos in a series of settlements extending from Cape Sabine in the south to Cape Hecla, the proposed point of departure of the "dash for the Pole." Commander Peary also plans to start on his Polar trip early in February, at an earlier date than any previously chosen by him.

The Baldwin-Ziegler Expedition.—The flagship *America* of the Baldwin-Ziegler expedition, which left Norway July 17, 1901, to seek the North Pole with what was supposed to be the most elaborate equipment that was ever furnished to an Arctic expedition, returned to Honningsvaag, August 1, 1902, with the report that nothing but preliminary work had been accomplished. The leader, Mr. Evelyn B. Baldwin, reported that during 1901 all the channels by which he hoped to reach by ship the northern island of the Franz Josef archipelago were blocked with ice. Repeated efforts to force the vessel north only depleted the coal supply. By means of sledge journeys, however, Mr. Baldwin transported depots of provisions from Alger Island, where he

made his headquarters, to Cape Claire, to Greely Island, and finally, to Prince Rudolf Land. These expeditions wore out most of his sledges, but demonstrated the usefulness of a new element in Polar expeditions—the use of ponies instead of dogs as traction animals. One of Mr. Baldwin's ponies could do the work of a good-sized team of dogs, and the difficulty of keeping the dog team in order is obviated by this method of transportation. The sledge journeys lasted from January 21 to May 21, 1902. Of the sixty sledges with which the expedition was equipped, fifty were destroyed. Of the 420 dogs that started with the expedition 150 died of an epidemic. Food for the remainder was running short, as well as food for the ponies, and as the coal supply had become meagre, the leader decided to return to Norway to procure fresh provisions. A dissension between Mr. Baldwin and his shipmaster, Capt. Johannsen, arose, moreover, during the winter, and Mr. Baldwin deposed the captain from command of the vessel. In Norway the captain took legal measures against the leader for this action, but was not sustained by the court. According to the announcements when the expedition started out in 1901, Mr. Baldwin was to receive the support of Mr. Ziegler for continued efforts to reach the North Pole, in case the attempt of 1901-02 should fail; but the patron of the expedition recalled the leader to America. It is rumored that Mr. Fiala, a photographer, who accompanied the expedition, has been selected by Mr. Ziegler to lead another expedition by way of Franz Josef Land, taking advantage of the caches that were placed by the Baldwin party. Meanwhile the steamship *Frithjof*, the auxiliary vessel of the expedition, had left Vardö for Franz Josef Land on July 7, 1902. She was unable to reach Alger Island, and returned to Norway.

Baron Toll.—In addition to the three expeditions that were in the field in 1902 for the purpose of discovering new lands, other explorers were in the north, filling in the details of lands already partly known and carrying out purely scientific research. Among these is Baron Edouard Toll, who in the ship *Zaria* has been in the Arctic waters since 1900. In the spring and summer of 1901, sledge parties set forth from the *Zaria*, which was ice-bound, for the purpose of exploring and surveying the Chelyuskin Peninsula and neighboring lands. Parties unsuccessfully attempted to discover the mouth of the Taimyr River. The *Zaria* was freed from the ice August 24, 1901, and cruised for a month in the waters near the New Siberian archipelago. On September 16 they met a relief party headed by K. A. Vollosovitch in Seal Bay, Kotelnýi, which remained with Baron Toll until February 27, 1902, and then returned to Irkutsk in safety. On May 1, 1902, Dr. Birula, the zoologist, with three Promyschlenniks left the *Zaria* to summer in the New Siberian Islands, and on May 27th, Baron Toll, Dr. Seeberg, the astronomer, and two sailors, with dogs and sledges, departed for Bennett Island, which has never been explored, and where only members of the *Jeannette* party landed. The *Zaria* got out of the ice July 1, but the disquieting news was received that owing to the condition of the ice and lack of coal she had been unable to take off either of the summering parties. The *Zaria* put into the mouth of the Lena August 26, and was met by the supply steamer *Lena*, August 30. The *Zaria* was laid up in a sheltered berth for the winter, and her party arrived at Irkutsk, September 30. A relief expedition under von Brusnew was to start in search of Baron Toll early in January, 1903. It was hoped, however, that he and Dr. Birula would be able to get to Irkutsk before the winter, or, at any rate, that the two parties would meet. The expedition has made many meteorological observations and has surveyed and mapped land hitherto unsurveyed; and added much information to the comparatively little known districts of the New Siberian archipelago. The main object of the expedition, however, the location of Sannikoff Land, has not yet been accomplished.

The Magnetic Arc Measurements.—During the summer of 1902 the magnetic arc was finished in Spitzbergen by the completion of the work of the Swedes who had left in 1901 two stations undone. The Swedes started for Spitzbergen July 26 on the steamer *Laura*, under the leadership of Dr. Rubin to take observations from Northeast Island to the most northern point of the Seven Islands, and returned September 14 to Tromsö. Although hindered by bad weather, they completed their triangulation of the degree that fell to their share. By the observations of the Russians and the Swedes, Spitzbergen has now become a fairly well-known country, and, indeed, topographical maps of the regions are promised that will bear comparison with similar maps of regions known for thousands of years. Careful examinations of the geological conditions—particularly observations of the movements of the inland ice—have been made, and the results have been published.

Captain Bernier, the Canadian who announced, in 1900, his plans for drifting across the Pole after the manner of Nansen, has obtained £20,000 of the £30,000 he needs for his expedition. His project has become more elaborate since he made public his original ideas. He means to avail himself of the latest devices in the way of equipment, including an apparatus for wireless telegraphing to civilization. He means to drift from Bering Strait as near the Pole as the current that sets

across the Arctic Ocean will carry him, and then to make a sledge journey from the likeliest point reached by the ship to the Pole itself. His ship, which is to be somewhat similar to the *Fram*, had not been built at the end of 1902.

Captain Warneck, the Russian, who, on the steamer *Pahlousov*, made a journey in 1901 from Alexandrovsk to Novaya Zemlya through the Kara Sea to Archangel, set forth on a new expedition in June, 1902. This expedition was fitted out under the direction of the Russian Hydrographical Society. Its members included Captains Serguéff and Morozoff, Lieutenants Yanoff, Brovtsyn, and Kozlaminoff, and Dr. Dalaloff. The purpose of the expedition was to explore and map carefully the unsurveyed portions of the Kara Sea and Murman coast and the eastern coast of the Yalmak Peninsula.

The Expedition to the North Magnetic Pole.—Among the Arctic expeditions announced for the future is that of Roald Amundsen, who has undertaken to add new and sound information to the conjectures of scientific men as to the present location of the northern magnetic pole. The location of the northern magnetic pole was fixed approximately by Sir John Ross in 1831, but its position has changed. Amundsen, who is a Norwegian, and was first officer of the Belgian expedition to the Antarctic regions in 1897-99, has published his plans for fixing the northern centre of magnetic force, for defining the area within which the dipping needle is perpendicular, for observing periods of high magnetic activity, and for furnishing in a certain measure a complement in the north to the magnetic work that forms so important a feature of the Antarctic expeditions now in the field. Captain Amundsen has bought a whaler called the *Gjoa* of only 48 tons, a craft 70 feet long by 20 feet beam, propelled by sail or by a petroleum motor at the rate of four knots an hour. He thoroughly tested this vessel, as well as his instruments in 1901, and he spent six months in her in the region between Novaya Zemlya and Spitzbergen, incidentally studying the polar currents. In June and July, 1902, he was in Wilhelmshavn having his instruments adjusted. In addition to an excellent equipment of meteorological and oceanographic instruments, he is fitted out with a fine set of instruments for the observation of magnetism. His plans, as announced by himself, are to leave Christiania in April, 1903; to put in at Godhavn, Greenland, for dogs, and to enter the North American waters by way of Lancaster Strait. His first base of observation is to be Leopold Harbor in North Somerset. Here he will establish an observatory. His absolute house is to be a snow house in winter, and in summer a tent whose top will consist of transparent white silk. During the summer of 1904 a series of sledge journeys will be organized to make observations in the largest possible area around the magnetic north pole. Captain Amundsen will, moreover, try to push his ship to King William Land, and to construct there a new observatory, whence he will send out small expeditions to cover the immediate region of the magnetic pole. In the third summer (1906) he will move his base to Hershel Island. It is his plan then to return to civilization by way of the Northwest Passage. He will have eight men on his expedition, including Lieutenant Godfried of the Danish navy, who will make geological observations.

The Russian Government is attempting to colonize Novaya Zemlya with Samoyedes. Game abounds in these islands, whereas it is becoming yearly scantier in the peninsula inhabited by this tribe. In the summer between 2000 and 3000 Samoyedes repair thither and become prosperous through the trapping of animals and of birds valuable for their feathers, which abound there. During the winter of 1900-01 one hundred Samoyedes remained on Novaya Zemlya, where three permanent stations have been established. Twice during the year a steamer from Archangel touches here.

The Danish Government, through the agency of the Carlsberg fund, was enabled to send out two small expeditions to East and West Greenland. Dr. C. Kruse left Copenhagen August 15, 1901, in the steamer *Godthaab*, and arrived at Angmagsalik September 5. Although the principal object of his expedition was botanical research, Dr. Kruse visited the large fiords of Angmagsalik and Sermilik, and made many ethnological observations. He was recalled September 2, 1902, and arrived at Copenhagen on the 28th of the month. The other expedition, led by Dr. Engell and Lieutenant Schjöring, went to Jakobshavn Fjord, which was reached June 19, 1902, after a seven weeks' voyage. The object of the expedition was to make surveys and a triangulation of this district and to observe the movements of the Jakobshavn glacier, which is the most rapid ice river known. Dr. Engell also surveyed the region lying south of Jakobshavn, which had not been adequately mapped. They returned to Copenhagen on October 22, having made the journey in five and a half weeks.

ARGENTINA, a South American republic lying between Chile and the southern Atlantic coast. The capital is Buenos Ayres.

Area, Population, etc.—The estimated area of the fourteen provinces and nine territories is 1,113,849 square miles. The population, according to the census of 1895, was 3,954,911 and, as officially estimated on December 31, 1900, 4,794,149. Estimates for

the several provinces on the latter date were: Buenos Ayres, 1,140,067 (exclusive of the city, which numbered 821,291); Santa Fé, 536,236; Córdoba, 419,072; Entre Rios, 343,684; Corrientes, 277,041; Tucumán, 249,433; Santiago, 180,612; Mendoza, 141,431; Salta, 131,938; Catamarca, 99,827; San Juan, 94,991; San Luis, 91,403; Rioja, 77,783; and Jujuy, 54,405. The estimated population of the city of Buenos Ayres on June 30, 1902, was 857,061.

The immigrants to Argentina numbered 111,083 in 1899, 117,036 in 1900, and 125,951 in 1901. Of the last number 58,314 were Italians, 21,788 French, and 18,066 Spaniards. The adult males numbered 56,811 and the adult females 18,672; 35,824 came by way of Montevideo. Of the total 42,747 were sent at public expense to their respective destinations; over half of these settled in the provinces of Buenos Ayres and Santa Fé. In 1901 an increase was noted in the arrivals of Polish Jews and Roumanians. The excess of immigrants over emigrants in 1901 was about 48,000. Primary instruction is free, secular, and nominally compulsory. The reported number of primary schools in 1899 was 4291, with an enrollment of 427,331 pupils. There are provisions for secondary and higher education.

Government.—The chief executive authority is vested in a president, who is elected for a term of six years, and appoints a responsible ministry. The president in 1902 was Señor Julio A. Roca, who assumed office October 12, 1898.

The legislative power devolves upon a congress of two houses, the senate and the house of deputies. Except in matters affecting the republic as a whole, the states are autonomous, having their own elected legislatures and governors.

The regular army numbers about 8600 officers and men, the effective army 29,500, and the national guard nearly 472,000. The Argentine navy is comparatively strong; besides marines the naval complement comprises about 8400 men. In the spring of 1902 the Argentine and Chilean governments concluded a protocol, one article of which provided for the equalization of their respective armaments. See CHILE.

Finance.—The monetary unit is the peso, which has a fixed gold value of 96.5 cents; the paper peso, however, is current at 44 per cent. of its face value. The most important sources of revenue are import duties and excise, while interest on the public debt is the largest item of expenditure. In 1901 the total customs duties amounted to 38,130,251 pesos gold and 138,615 pesos paper, of which 32,188,032 pesos gold were import duties. Revenue and expenditure are stated as follows, the figures for 1902 and 1903 being estimates:

	1899	1900	1901	1902	1903
REVENUE.					
Pesos, gold.....	45,076,189	36,632,346	38,244,638	40,013,347	40,111,339
Pesos, paper.....	61,419,990	63,962,000	62,341,306	64,290,000	61,820,000
EXPENDITURE.					
Pesos, gold.....	30,860,817	23,819,979	23,835,847	32,438,189	29,496,172
Pesos, paper.....	103,887,458	94,271,310	91,160,225	96,198,813	95,206,218

According to President Roca's message to the congress in May, 1902, the apparent foreign debt at the end of 1901 was 386,451,295 pesos gold, but if certain amounts that do not properly constitute a debt are deducted the actual foreign debt stood at about 300,000,000 pesos gold. In addition, however, the government owed European bankers £2,558,475. The consolidated internal debt at the end of 1901 amounted to 17,863,000 pesos gold and 83,610,983 pesos paper.

Industries and Commerce.—As a producer of pastoral and a limited number of agricultural commodities—wheat, corn, and flax—Argentina is one of the most important countries in the world. The following official figures for crop areas and production are based partly on actual returns and partly on estimates. (The hectare equals 2471 acres, and the metric ton 2204.6 pounds.)

	Wheat.		Corn.		Linseed.	
	Hectares.	Tons.	Hectares.	Tons.	Hectares.	Tons.
1899-1900.....	3,167,283	2,800,000	1,244,182	1,800,000	355,329	250,000
1900-01.....	3,307,749	1,964,437	607,352	389,951
1901-02.....	3,221,086	1,584,405	1,405,806	2,134,165	782,880	366,000

The areas for 1902-03 were estimated at 3,254,641 hectares for wheat, and 955,873 hectares for linseed. Alfalfa is an important crop. In 1901-02 the area under sugarcane was 67,218 hectares; vines, 45,533 hectares; peanuts, 23,765 hectares; and tobacco, 12,606 hectares. Sugar produced in 1901 amounted to 163,695 tons, and wine (largely in Mendoza), 1,844,196 hectolitres (the hectolitre equals 26.417 gallons). In 1902 there were under cultivation 17,174,250 acres, as compared with 7,478,700 acres in

1880. Large areas of public lands in the territories may be purchased or rented from the government. These, as officially stated in 1902, are as follows: Santa Cruz, 61,626,144 acres; Chubut, 55,687,983; Rio Negro, 37,266,057; Chaco, 32,182,861; Formosa, 21,430,165; Neuquen, 15,249,923; Pampa, 7,718,261; Tierra del Fuego, 4,840,418; Misiones, 1,956,240; total, 237,788,343 acres. The price an acre ranges from 16 to 40 cents. In 1902 there were probably about 30,000,000 cattle in Argentina, and between 110,000,000 and 120,000,000 sheep. Reports of unfavorable economic conditions in Argentina were current in 1902. Foreign capital, which is largely English, was said to have suffered severely.

The gold values of general imports and exports, exclusive of specie, have been in pesos as follows:

	1898	1899	1900	1901
Imports, dutiable.....	93,988,545	102,080,738	96,502,452	95,252,275
Imports, free.....	13,410,355	14,769,933	16,982,617	18,707,474
Total.....	107,428,900	116,850,671	113,485,069	113,959,749
Exports, dutiable.....	71,472,647	100,868,723	56,169,377	74,373,521
Exports, free.....	62,356,811	84,049,108	98,431,035	93,342,581
Total.....	133,829,458	184,917,831	154,600,412	167,716,102

The gold values of the foreign commerce by countries of greatest trade importance have been reported in pesos as follows:

	Imports from		Exports to	
	1900	1901	1900	1901
Great Britain.....	38,682,753	36,400,808	23,890,686	29,920,759
Germany.....	16,635,613	10,724,549	20,070,133	21,479,883
United States.....	13,438,529	15,533,639	6,882,763	9,296,454
Italy.....	14,924,498	14,736,103	4,304,154	4,318,950
France.....	10,897,866	9,959,541	19,007,960	28,637,121
Belgium.....	8,430,880	8,688,657	17,980,885	13,457,731
Brazil.....	3,741,877	4,388,047	6,185,507	9,702,488
Spain.....	3,691,998	3,912,536	2,131,713

The leading imports are textiles and wearing apparel (37,597,847 pesos in 1900) and iron and steel goods (19,054,051 pesos in 1900). The principal exports reported for the calendar year 1901 include the following, the unit of quantity being the metric ton of 2204.6 pounds, and the unit of value the peso, worth 96.5 cents. Wheat, 904,269 tons (1,929,676 in 1900), valued at 26,240,735 pesos; wheat, flour, and bran, 160,396 tons, 4,165,726 pesos; corn, 1,112,290 tons (713,248 in 1900), 18,887,397 pesos; wool, 228,358 tons (100,913 in 1900), 44,666,483 pesos; linseed, 338,828 tons (223,257 in 1900), 10,515,263 pesos; hay, 95,120 tons (102,836 in 1900); sheepskins, 33,659 tons, 7,339,811 pesos; tallow, 25,744 tons, 3,902,909 pesos; ox-hides 3,504,068 in number (3,359,463 in 1900), 14,130,294 pesos, including the value of 261,360 horsehides; frozen beef 44,904 tons (24,590 in 1900), 4,490,447 pesos; frozen mutton, 63,013 tons (56,412 in 1900); jerked beef, 24,296 tons (16,449 in 1900), 2,879,455 pesos; butter, 3,322,391 pounds (2,322,663 in 1900); quebracho, 184,654 tons, 2,440,199 pesos; and 119,189 cattle and 44,550 other live stock. The foreign shipping entered in 1900 aggregated 6,193,783 tons.

According to the *Revista Mensual*, of Buenos Ayres, there entered the ports of the republic in 1901 51,284 vessels with an aggregate gross tonnage of 12,629,329, and cleared 51,422 vessels aggregating 13,283,272 tons.

Communications.—In May, 1902, President Roca in his message to the congress stated that there were 17,663 kilometres (10,975 miles) of railway in Argentina. The government lines comprise only about 2000 kilometres, with a capital at the end of 1901 of about 54,959,000 pesos, which in that year realized an interest of 1.15 per cent.; the private lines represent a capital of over 486,616,000 pesos, which showed an interest return in 1901 of 4.29 per cent. The government has sanctioned the construction of a railway from Jujuy, the northern terminal of the Argentine system, to La Quiaca on the Bolivian frontier, 291 kilometres distant. The line is to be open for traffic in 1904. A continuation of this railway is projected by the Bolivian government. In April, 1902, it was reported that the government had accepted a tender of the Creusot Company to build a harbor at Rosario for 53,000,000 francs (\$10,229,000).

Labor Troubles.—In November, 1902, a general strike, declared by the labor unions, took place at Buenos Ayres, and for a time business was practically sus-

pended, resulting in heavy losses, especially to shippers. The unions demanded complete recognition from the employers and insisted that only union men be employed. To force submission to the union demands, the stevedores gave notice that after November 1 they would handle no packages exceeding a certain weight. For this the trade was unprepared and though a four days' respite was granted to the shippers, most of the goods awaiting shipment had to be repacked at a great loss. As soon as this strike was settled another was ordered, including a number of trades, cartmen and even bakers. The large meat-freezing plants at Buenos Ayres appealed to the government for aid; the threatened spoiling of large quantities of meat would not only result in great financial loss, but would be a menace to the public health. Riots ensued and the strike was not broken until the government ordered out the troops and declared the city and the provinces of Buenos Ayres and Santa Fé in a state of siege. The strikes appear to have been in some degree fomented by anarchistic agitators, some of whom were expelled from the country.

The Welsh Colony.—Discontent among the Welsh colonists in the Chubut Valley resulted in 1902 in an effort to transport about 500 of them to the Canadian Northwest Territories, where large tracts of land had been offered them. The colony, whose centre of population is Trelew, about 25 miles from the mouth of the Chubut River, was founded in 1866. Trelew is connected by a railway 44 miles long with Puerto Madryn, on Bahía Negra, and steamers of the Hamburg-American Company afford communication with the outside world. The colony, with a reported population of about 3800, is said to cover an area of 250,000 hectares. Authorities are in conflict concerning the character of the country and consequently, in some degree, the justification of the settlers in asking for deportation. According to a statement based on a report of a Canadian agent who visited the settlement, the district is "a sterile, rainless tract, without trees or rich soil," while Señor M. G. Mérou, Argentine minister at Washington, says that "at present (March, 1902) Chubut is enjoying prosperity" and he speaks of "the magnificent regions of the southern part of the Argentine Republic." The mean temperature of Chubut is 56.2° F., or 70° in January and 42.4° in July. It is certain that of late years the colony has suffered severely from floods, especially those of July, 1899. But the discontent of the Welsh seems due largely to the interference of the Argentine government in their local administration and to the law of compulsory military service. Early in 1902 a deputation of the colonists, which, according to Señor Mérou, was repudiated by a large majority of the Chubut inhabitants, went to London, seeking aid from the British government for transportation to Canada and for establishment there. Mr. Joseph Chamberlain, the British colonial secretary, ruled that, while imperial aid might be given to prospective settlers of a crown colony, such assistance could not be granted to persons going to a self-governing dependency. Some of the Welsh, however, succeeded in going to Canada, where they established the Llewellyn colony at Saltcoats, Assiniboia. At the end of 1902 it appeared from an official Canadian report that remarkable progress had been made, though some poverty and a good deal of hardship were inevitable in the circumstances. The settlers had accomplished more than had seemed possible, and it appeared that they would probably get on well in their new home.

Some friction with Great Britain occurred in 1902 over the apparent indisposition of the Argentine authorities to investigate properly the murder of a Mr. Barnett, a British subject, which was committed on April 26, by the son of a police official at Zuviria. Finally, however, the murderer was apprehended and in November was sentenced to eight years' imprisonment. For Argentina's relations with Chile and the boundary award, see CHILE.

ARIZONA, a southwestern territory of the United States, has an area of 112,920 square miles. The capital is Phoenix. Arizona was organized as a territory February 24, 1863. The population in 1900 was 122,212, while in June, 1902, as estimated by the government actuary, it was 132,000. The largest city is Tucson, with a population in 1900 of 7531.

Finance.—The receipts of the treasury for the fiscal year ending June 30, 1901, were \$385,317.91 and the expenditures were \$373,436.66. The balance on hand July 1, 1901, was \$108,180.19. The receipts during the year ending June 30, 1902, were \$514,940.65; the expenditures were \$479,167.22, leaving a balance in the treasury June 30, 1902, of \$143,953.62. The total valuation of property in the territory, as returned by the assessors in 1902, was \$39,083,177.57, an increase over 1901 of \$229,346.20. The tax rate for 1902 was \$1.137 per \$100 of valuation, as against \$0.85 in 1901. The total bonded debt December 31, 1902, was \$2,610,000, from which must be deducted county and city bonds amounting to \$1,634,027.57, leaving the net bonded debt of the territory \$975,972.43. The floating debt was \$119,839.02, making the total territorial debt \$1,095,811.45.

Industries and Agriculture.—Mining is the principal industry of the territory, and in 1902 there were 1641 patented mines valued for taxation at \$1,867,825.08—a figure

much below their actual value and \$2,915,648.23 less than the valuation in 1901. Improvements on patented and unpatented mines were valued at \$1,789,237.76. The principal metals mined in order of their importance are gold, silver, and copper. The production of copper decreased slightly on account of the decline in price of that metal. The production of gold greatly increased, as did also the quantity of silver mined, though the value of the total output of silver was but little increased. Extensive preparations were made to improve the abandoned silver mines of Tombstone. Three extensive copper-gold ledges were uncovered on February 5, 1902, at the Angell group of mines in central Arizona. About the same date an immense deposit of silver-copper ore was discovered in the Casey group, Chiricahua Mountains, southern Arizona. The Exposition mine, the Trilby Bell gold mine, and the mines of the San Domingo group, eight miles east of Wickersburg, with about forty claims and prospects, were sold on April 23 to New York capitalists for \$1,000,000.

Stock raising, the second industry in importance in Arizona, has been greatly handicapped by the severe drought of the last five years. The assessor's rolls show a marked decrease in the number of live stock, especially cattle. This decrease was due to the difficulty of getting feed and water and even more to the high prices, which induced ranchers to dispose of every available animal. Following are the assessor's returns of live stock in Arizona for 1902: Horses, 37,892, valued at \$722,972.80; cattle, 256,122, \$2,726,969; sheep, 367,524, \$735,048. The decrease in value of horses, cattle, and sheep since 1901 was \$461,090.

Arizona contains about 10,000,000 acres of irrigable land, of which about 1,000,000 acres have been partly or wholly reclaimed. The federal irrigation law is of vital importance to the territory. Plans were made to construct a huge reservoir at the Tonto Basin site on the Salt River, near Phoenix. By building a wall of masonry about 200 feet long, the largest artificial lake in the world will be formed. Reservoir sites were surveyed at San Carlos and The Buttes on the Gila River. Great interest was shown in the development of artesian wells. Many wells were put down in the San Simon, Gila, San Pedro, and Santa Cruz valleys. The wells are 300 to 400 feet deep and cased with two-inch pipe. One well is sufficient to irrigate from 25 to 40 acres, according to kind of soil and crop. Probably the most valuable crop in Arizona is alfalfa. Vegetables and small fruits thrive well. The Eastern Sugar Company caused experiments in sugar-beet culture to be carried out in Arizona during 1902 with very satisfactory results both as to quantity and quality of beets grown. Experiments in the culture of the date palm indicate that this useful fruit can be grown profitably in Arizona.

Forests and Lumber.—In the northern part of Arizona are large pine forests covering an almost unbroken area of 10,000 square miles. The manufacture of lumber for the fiscal year ending June 30, 1902, was more than 23,000,000 feet. The making of boxes was the most important branch of the wood manufacturing industry. A number of forest reserves were established during the year, and efforts were made to re-forest denuded tracts, to extend tree planting, and to establish a scientific system of forestry.

Communications.—Railway building during 1902 was more active than ever before in the history of the territory. The El Paso and Southwestern Railway was completed from El Paso to Bisbee, causing passenger and freight rates to be materially lowered by its competition. Improvements and new construction were extensive on all lines. There were 1,952.11 miles of railroad in the territory in 1902, valued for taxation at \$4,943,386. All roads report heavy gains in freight business during the year.

Education.—The territory has an excellent educational system, extending from the common schools up to the normal colleges and the university. A considerable increase in the attendance was reported for the year. The total number of teachers employed in 1902 was 457, and the total enrollment 25,259, as compared with 23,435 in 1901.

Needs of the Territory.—The subject of statehood was the all-absorbing question throughout 1902. The people of Arizona believe that they have met all the requirements for admission into the Union although the population of the territory is less than two-thirds the population required in a single congressional district, and the total value of all property in the territory is less than that of Yonkers, N. Y. A much more obvious need of the territory is the construction of irrigation systems under the provisions of the federal law in order to reclaim the desert and make it possible to support a population large enough to make the demand for admission into the Union effective. Capital is needed in all lines of industry to exploit more fully the resources of this vast region. Forceful measures on the part of the national government are needed to conserve the forest areas, and extend forest culture to the non-forest bearing regions.

Political.—Benjamin Daniels, a Democrat, and formerly a member of the regiment

of Rough Riders, was in January, 1902, appointed by President Roosevelt United States marshal of the territory. Governor Murphy, in April, announced his intention of resigning. Alexander O. Brodie, lieutenant colonel of Rough Riders under Roosevelt, was announced as his successor, having been named by the President some time previously. His installation occurred in July. Governor Brodie is fully conversant with the affairs of the territory. He served with distinction in the war with the Apaches and in Washington in its territorial days. From 1878 to 1882 he managed a cattle ranch in Kansas, and for the next five years was engaged in mining in Dakota and Arizona.

Territorial Officers, 1902.—Governor, Alexander O. Brodie; secretary, Isaac T. Stoddard; treasurer, Isaac M. Christy; auditor and comptroller, W. F. Nichols; attorney-general, Edmund W. Wells; superintendent of public instruction, Nelson G. Layton; adjutant-general, B. W. Leavell—all Republicans. Supreme Court: Chief justice, Edward Kent; associate justices, George R. Davis, Fletcher M. Doan, and Richard E. Sloan.

ARKANSAS, a south central State of the United States, has an area of 53,228 square miles. The capital is Little Rock. Arkansas was organized as a territory March 2, 1819, and admitted as a State June 15, 1836. The population in 1900 was 1,311,564, while in June, 1902, as estimated by the government actuary, it was 1,348,000. The populations of the largest cities in 1900 were: Little Rock, 38,307; Fort Smith, 11,587; Pine Bluff, 11,496.

Agriculture and Industries.—The various industries of the State were more than ordinarily prosperous during 1902. This condition was the more marked because of the contrast with the ill-favored season of 1901. The general drought that prevailed throughout the southwest in July and August, 1901, was felt severely in Arkansas, and as a result the cotton crop, which, in general nearly equals in value all the other crops of the State, was very poor—the Department of Agriculture estimating it at 51 per cent. of a full crop. The corn crop was even more severely injured, the average for the State being but 8.1 bushels per acre. In 1902, however, the cotton crop was 4 per cent. greater than the ten-year average, and corn, as reported, was also above the average—2,378,171 acres yielding 59,655,042 bushels. The oat yield was 5,048,400 bushels, and wheat, 2,245,889 bushels. Apples were placed at 63 per cent., against an average of 49 per cent. In the northwestern part of the State fruit raising was undertaken in 1902 on a larger scale than ever before. Conditions in the mining region in the northern part of the State were reported as being most favorable. The output of the coal mines was increased to meet the unusual demand. Important phosphate deposits are being developed in the north-central part of the State. Two railroads were pushed into the field, one up the White River from Batesville, the other southeast from Harrison.

Railroads.—The total number of miles of railroads operating in the State of Arkansas during 1901 was 3,802.4. The total income from passenger business was \$2,175,738.08. The total freight earnings were \$4,296,858.56. The total gross earnings, including earnings from other sources, were \$6,744,588.12. According to the report of the Railway Commission of Arkansas, the operating expenses for the year 1901 were \$7,669,705.06, leaving a net deficit from operations of \$925,116.94. The fact that the lines operating in Arkansas made large profits on the total business of the entire lines in and out of the State would indicate that these figures are not to be relied upon. The total number of tons of freight shipped by rail in Arkansas for 1900 was 3,180,936 tons. For 1901 the total was 4,325,900 tons, a net increase of 1,144,964 tons.

Negro Convicts.—Early in May, 1902, Governor Davis issued a statement requiring all applications for pardons for negro convicts to be accompanied by paid transportation to Boston or some other point in New England. Representative Toney, of Pine Bluff, bought a ticket for a negro forger and then applied for a pardon, which the governor declined to grant unless Toney would procure the services of an officer who would take the man to Boston and remain there until the negro established his citizenship.

Political.—James K. Jones, who, as chairman of the Democratic National Committee in 1896 and 1900, managed Mr. Bryan's two campaigns for the Presidency, was defeated in his campaign for re-election to the United States Senate in the spring of 1902 by ex-Governor James P. Clarke. In Arkansas, the voters manifest their choice of a senator at the primary elections, the State legislature afterwards ratifying their decision. In this way Arkansas virtually elects her senators by popular vote. Senator Jones is a close personal friend of Mr. Bryan, and has often expressed his antipathy to the trusts. His alleged connection, however, with the Round Cotton Bale trust, a monopoly that has caused some bad feeling in the South, contributed in some degree to his defeat.

Conventions and Platforms.—The Democratic State convention was held at Little Rock on June 11, 1902. The Kansas City platform of 1896 was endorsed in a

general way; the Dingley tariff was protested against as encouraging monopolies; an increase of power was urged for the Interstate Commerce Commission; authority similar to that given to the Commission was asked for a State commission; the Panama route for the Isthmian canal was advocated; emphasis was placed on the necessity for proper representation of the State at the Louisiana Purchase Exposition; liberal support for public schools was insisted upon, also the taxation of public franchises. The convention endorsed the administration of Governor Davis. The vote of the convention in favor of ex-Governor Clarke to succeed James K. Jones in the United States Senate was 420 to 70. Governor Jeff Davis, who carried 70 out of 75 counties in the primaries, was unanimously renominated, the name of Col. E. W. Rector of Hot Springs having been withdrawn. Governor Davis, in his speech of acceptance, announced himself as a candidate for the United States Senate to succeed James H. Berry, when the term of the latter expires in 1905.

Owing to dissension in the ranks of the Republican party in Arkansas two separate Republican conventions were held at Little Rock on June 25, 1902. The Clayton faction adopted a platform that reaffirmed the Republican national platform of 1900; advocated Cuban reciprocity and an Isthmian canal; condemned the formation of trusts; called for a liberal appropriation for the Arkansas exhibit at the St. Louis world's fair; denounced lynching and every other form of lawlessness; urged the people of Arkansas to support law and order; and indorsed the Administration in the following words: "We endorse the administration of President Roosevelt and pledge him support in the continuance of our national prosperity and the maintenance at home and abroad of the nation's honor. Should he be the Republican standard bearer in 1904, we pledge an increase of Republican votes from Arkansas." The anti-Clayton Republicans also endorsed the President, and in a general way covered ground similar to that taken by the other faction.

Elections.—At the regular biennial State election held September 1, 1902, a full Democratic ticket was elected. For governor, Davis (Dem.) received 77,354 votes, and Myers (Rep.) 29,251. The State legislature for 1903 comprises 133 Democrats and 2 Republicans.

Other Events.—The heirs of Villiot, a Frenchman, who, his descendants hold, received from Louis XVI. the grant of a square league of land now used as a government reservation at Hot Springs, filed suit in September, 1902, in the federal court at Little Rock, to recover the property. Lumber yards and dry kilns were burned at Kitson on January 16, 1902, resulting in the destruction of 4,000,000 feet of lumber. A terrific snow and sleet storm visited Little Rock in January, lasting several days and doing nearly half-a-million dollars' damage in the business section of that city. Seven men were killed and twelve seriously injured in February by the falling of a boulder upon a train on the Choctaw, Oklahoma and Gulf Railroad, thirty miles from Little Rock.

State Officers.—For 1902: Governor, Jefferson Davis; lieutenant-governor, Robert L. Lawrence; secretary of state, John W. Crockett; treasurer, Thomas E. Little; auditor, T. C. Monroe; attorney-general, George W. Murphy; superintendent of education, J. J. Doyno, October, 1902; commissioner of agriculture, Frank Hill, October, 1902; commissioner of insurance and public lands, John W. Colquitt, October, 1902—all Democrats. For 1903: Governor, Jefferson Davis (elected for 2 years, term ending January, 1905); lieutenant-governor (vacancy); secretary of state, John W. Crockett; treasurer, H. C. Tipton; auditor, T. C. Monroe; attorney-general, George W. Murphy; superintendent of education, J. H. Hineman, until October, 1904; commissioner of agriculture, H. T. Bradford, until October, 1904; commissioner of State lands, F. E. Conway, until October, 1904—all Democrats. Supreme Court in 1902 and 1903—Chief justice, Henry G. Bunn; associate justices, Burrill B. Battle, Simon P. Hughes, Carroll D. Wood, and James E. Riddick—all Democrats. For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

ARMENIA and Kurdistan, Turkish territory in eastern Asia Minor, comprising the vilayets of Erzerum, Mamuret-ul-Aziz (Kharpout), Diarbekir, Bitlis, and Van, has an estimated area of 72,491 square miles and a population variously estimated at from 2,500,000 to 5,000,000—probably the latter figure is considerably too large. The Armenian inhabitants are outnumbered by the Moslems, Kurds, and Turks; in Transcaucasia (Russian) there are about 1,000,000 Armenians and others in Persia, European Turkey, and elsewhere, so that the Armenian race probably numbers upwards of two and a half millions. The Armenians are Gregorian Christians. Persecution and outrage, perpetrated by the Kurds and Turks at the connivance of the Sultan, continued in 1902, but since the great atrocities of 1894 and 1895 the policy of the oppressor has been to supplant wholesale butchery, which might attract too much disagreeable attention in foreign chancelleries, with "massacre in detail." Thus Moslem outrage persists steadily without arousing western peoples to the point of formidable remonstrance. At the beginning of 1902 Kurdish outbreaks took

place in the vilayets of Erzerum, Diarbekir, and Bitlis. In addition to the general hostility of the Kurdish soldiery the Armenians were suffering from excessive taxation imposed by the Turkish government. These conditions have led to a large emigration, which has become a source of uneasiness to many wealthy Turks to whom a large part of the Armenian land belongs. Indeed in March, 1902, it was stated that the Armenians in the district of Erzerum, finding the persecution intolerable, had determined to emigrate to Russia *en masse*. On August 2, 1902, the Armenian patriarch tendered his resignation on the ground that no satisfactory results had come from his protests against the exceptional measures taken by the Porte with regard to his co-religionists. The ministry of public worship returned the resignation, assuring the patriarch that an investigating commission would be appointed, and on August 31 an irade was promulgated abolishing certain restrictions prejudicial to Armenian prosperity. Nevertheless in the summer and fall of 1902 there were fears of another general massacre. British, French, and Russian consular agents were sent to Sassun, but apparently their presence had little effect on conditions there, which in October practically amounted to a state of siege. Turkish troops were stationed throughout the Mush Valley and the usual outrages were taking place. Already the United States government had advised its consul at Erzerum to use every means possible in the protection of American interests at Mush. It is not exactly clear what are American interests at Mush, but it is certain that every Armenian disaster has a direct effect in the United States; for the Armenians there send funds to their oppressed brethren at home in proportion to the latter's misfortune, while after each massacre some of the survivors emigrate to America.

An Armenian congress, attended by prominent people from various countries, was held at Brussels in July, 1902. It formally expressed the hope that the Powers would compel the Porte to conform to article sixty-one of the Treaty of Berlin, which guarantees certain rights and liberties to the Armenians but which has always been disregarded, and to carry out the reforms promised in 1895. The congress proposed that the Powers insist on the appointment of a governor of European nationality and the creation of a local non-Turkish militia. An international permanent committee was formed. Much pro-Armenian sentiment was aroused, but in some quarters it was held that the continued agitation in behalf of the Armenians would probably have no effect upon the Ottoman authorities and that a better way to mitigate existing evils would be a concerted effort for general reforms throughout all the Turkish dominions.

Coincident with the growth of German influence in Mesopotamia is that of Russian in Armenia and other parts of northern and eastern Asia Minor. Russia has the exclusive right to build and operate all railways in the vilayets of Erzerum and Trebizond and the promise that only Turks will build railways in the vilayet of Sivas. Meanwhile Russian roads are being extended from the Caucasus.

ARSENIC. The manufacture of arsenical compounds is a new industry in this country. For several years a smelting company in Seattle, Wash., has conducted experiments for the purpose of utilizing its waste arsenical ores, and in 1901 began the manufacture of arsenic upon a commercial scale. The output in that year was 300 short tons, but it increased in 1902, according to *The Engineering and Mining Journal*, to 2400 tons, valued at \$144,000. Previous to 1901 the markets of the United States were supplied entirely by foreign material, largely produced in Cornwall and Devon, England, and at Freiberg, Germany. As the domestic resources in arsenical ores are very extensive, it is probable that they will soon be utilized to such an extent as to supply the requirement of this country in the various products of arsenic.

ART STUDENTS' LEAGUE of New York was founded in 1875 for the purpose of organizing and conducting classes in painting, drawing, modeling, and composition. Membership, about 500; number of students, 1000. At the annual meeting held in April, 1902, four prizes of \$50 each were awarded, one for the encouragement of the practical side of art, one for best composition in the illustration classes, one for drawing in the antique, and one for progress in portrait study. Advisory director, John La Farge; president, Samuel T. Shaw; secretary, Florence Choats. Headquarters, 215 West Fifty-seventh Street, New York City.

ASHANTI. See **GOLD COAST.**

ASHMEAD-BARTLETT, Sir **ELLIS**, British statesman, died in London, January 18, 1902. He was born in Brooklyn, N. Y., in 1849, but was sent to England at an early age to be educated. Having graduated with first-class honors at Christ

Church, Oxford, in 1872, he remained in England to enter political life, and was called to the bar in 1877. He renounced distinctively American ideas, became an ardent supporter of Lord Beaconsfield, and by his strong Tory views attracted considerable attention. Having been elected to Parliament, he defended the imperialist policy of which Lord Beaconsfield was the chief promoter and consistently maintained that attitude during the remainder of his life. He sat in Parliament from 1880 to 1885 and in 1886, 1892, and 1895; and was civil lord of the admiralty in 1885 and from 1886 to 1892. During the war in South Africa he served there in a subordinate capacity. A most notable phase of his political career was his violent opposition to the policy of the late Charles Stewart Parnell, the Irish home-rule leader, whom he attacked in his journal, *England and the Union*. He was knighted in 1892. In 1897 he published *The Battlefields of Thessaly*.

ASSOCIATE REFORMED SYNOD OF THE SOUTH, a Presbyterian body, the only independent division of Associate Reformed Presbyterians. It includes 151 churches, with 104 ordained ministers and 11,903 communicants, having congregations in all of the Southern States, except Louisiana, though its greatest strength is in North and South Carolina. The leading educational institutions of the denomination, Erskine College and Erskine Theological Seminary, and Due West Female College, are situated at Due West, S. C.; and there are several preparatory schools in North Carolina, South Carolina, and Georgia. Foreign missionary work is conducted in Mexico, in the states of Tamaulipas, Vera Cruz, and San Luis Potosí. The field is organized into 15 stations, and 19 missionaries are employed. The efforts of the denomination are being especially devoted to the Twentieth Century Fund of \$60,000 for Erskine College and Due West Female College, the educational work in Mexico, and for home missions. The annual meeting of 1902 was held November 6-11, in Gastonia, N. C. At its next session (November 5-10, 1903) in Winnsboro, S. C., the synod will celebrate its centennial. Stated clerk, Rev. James Boyce, Due West, S. C.

ASSOCIATED PRESS, an organization for the collection and distribution of news, was first incorporated in Michigan, later in Illinois, and in 1900 in New York. The Associated Press has its own leased wires, which form a network across the continent from St. John, N. B., to Seattle, Wash., and San Diego, Cal., and from Duluth, Minn., to New Orleans, Galveston, and the City of Mexico. The total mileage of this leased wire system is approximately 13,400 miles for day wires and 18,900 miles for night wires. At the annual meeting held in New York City, September 18, 1902, the following directors were elected: Whitelaw Reid, *New York Tribune*; C. W. Knapp, *St. Louis Republic*; Victor F. Lawson, *Chicago Daily News*; Stephen O'Meara, *Boston Journal*; A. J. Barr, *Pittsburg Post*; H. W. Scott, *Portland Oregonian*; George Thompson, *St. Paul Dispatch*; W. L. McLean, *Philadelphia Evening Bulletin*; Clark Howell, *Atlanta Constitution*; H. Ridder, *New York Staats Zeitung*; T. G. Rapier, *New Orleans Picayune*; Frank B. Noyes, *Chicago Record-Herald*; C. H. Grasty, *Baltimore Evening News*; W. D. Brickell, *Columbus Evening Dispatch*; M. H. DeYoung, *San Francisco Chronicle*. The directors subsequently elected Frank B. Noyes president and Melville E. Stone secretary and general manager.

ASTOR LIBRARY. See NEW YORK PUBLIC LIBRARY.

ASTRONOMICAL PROGRESS DURING THE YEAR 1902. For 1902 there are no especially prominent advances in observational astronomy to record. Routine work of course went on regularly at the various observatories, but there were no brilliant new stars, like the one which in 1901 appeared suddenly in Perseus, and which is still visible. Nor did astronomers discover any remarkable naked-eye comets. On the other hand, several theoretical researches of far-reaching importance were published, and some of these are explained below. Especial attention has been given to the light-pressure theory of Svante Arrhenius, of Sweden, and to the researches of J. C. Kapteyn, of Holland, upon the nature of the stellar universe.

Statistical Study of the Stars.—During the last few years astronomers have given much attention to a method of sidereal investigation called by the foregoing name.

The fundamental idea of this method is to collect from every source the isolated facts that have become known about the stars, and to deduce from these, if possible, some new facts affecting the universe as a whole. The method, of course, is not new; it has always been the object of scientific men to proceed from individual observations to generalizations of importance. But the plan, as applied very recently, has resulted in something more definite than mere speculation, and very important light has been thrown on existing theories as to the structure of the universe. It may be said that the statistical method was first applied to the sky by the elder Herschel, who made what he called a series of "star-gauges" near the beginning of the last century. These were simply separate counts of the number of stars visible in the field of view of his telescope. He made about 3400 of these counts, and thus came into possession of valuable statistical knowledge as to the apparent density of stellar distribution. His son, Sir John Herschel, extended this work to the southern hemisphere, and the net result was a rough table of "stellar densities" for the whole sky, or, in other words, what may be called the "number of stars per square degree" in different parts of the sky. They found, of course, the greatest density in and near the galaxy, or milky way, and a gradual thinning out towards the galactic poles, or those points of the sky furthest from the milky way. Upon these star-gauges Herschel founded his well-known theory of the stellar universe, making it consist of a comparatively thin disc or ring of stars within which our solar system is itself situated. Thus, Herschel said, when we look out in any direction in the plane of the disc, we must be looking through the thickest part of the stars, and see them projected as a ring or band on the sky. Such a band must be very thickly studded with stars, and those parts of the sky at right angles to it should be comparatively star-poor.

Herschel's results have of course been replaced by far more accurate counts based on both visual and photographic observations, but his principal conclusions are still accepted in the main. The very latest discoveries in this connection are due principally to Kapteyn and Newcomb. Kapteyn has published his researches in three important memoirs entitled *On the Mean Parallax of Stars of Determined Proper Motion and Magnitude*, *On the Distribution of Cosmical Velocities*, and *On the Luminosity of the Fixed Stars*. These memoirs have been published by the Astronomical Laboratory of Groningen, Holland, and by the Scientific Section of the Royal Academy of Amsterdam. Newcomb's most recent discoveries and cosmical speculations were published in 1902 in the *Astronomical Journal*, Cambridge, Mass., under the title *Statistical Relations Among the Parallaxes and the Proper Motions of the Stars*. To make these researches plain, it is necessary to point out the meaning of the astronomical terms occurring in the foregoing titles. The parallax of a star is in a certain sense merely another name for the star's distance. But stellar distances are so vast that astronomers prefer not to use for them our ordinary linear units, such as the mile or kilometre. They prefer to speak of the parallax as an angle; and it is defined as the small angle that would be filled up by the radius of the earth's annual orbit about the sun if seen by a supposed observer at the star. Great as is the radius of that orbit (about 92 million miles) it is always very small in comparison with stellar distances; and the parallax angles of even the nearest stars are always less than a single second of arc. The other technical term "proper motion" is used by astronomers to designate the changes in a star's position on the sky, caused by actual motions in space. If we measure the exact place of a star on two widely separated dates, we usually find a slight change. These changes are uniformly progressive in character; and astronomers measure them as angles. In other words, the small angle by which a star changes its place on the sky in a year is called its annual proper motion.

The quantitative determination of stellar parallax is always a matter of the greatest difficulty, on account of the extreme minuteness of the angles to be measured. We have already stated that parallaxes are always less than a second of arc, and they are therefore always near the limit which separates the measurable from that which is still beyond human observational powers; so that astronomers have as yet determined the parallaxes of only a comparatively small number of the vast assemblage of stars in the sky. In selecting objects for parallactic study they have in the past been guided by certain rather vague rules. Stars have not been picked out at random to be tested for parallax, but certain indications of possible proximity have been given due weight in the selection. These indications are two in number: first, brightness of the star; second, large proper motion. It has been assumed with justice that, other things being equal, comparative brightness signifies comparative proximity. Furthermore, assuming the actual linear stellar motions in space to be probably equal or nearly so, it is legitimate to assume also that proper motions apparently large are really due to comparative proximity, since the same quantity of actual motion would seem larger or smaller according to whether the moving star is near us or far away. Now Kapteyn has reduced these

rather vague considerations into a tangible law that must be accepted as a good first approximation at least to the real facts of nature. Collecting together all the existing actual measures of parallax possessing sufficient reliability, he has submitted them to an elaborate discussion, and obtained a law expressing in mathematical form the probable relation between parallax, brightness, and proper motion. Measuring brightness by the usual astronomical scale of stellar magnitudes, we get from Kapteyn's law the following table showing the parallaxes of stars having various magnitudes and proper motions. These parallaxes are to be considered of course only as average values, not as the actual parallaxes of all the stars in question; and, as we have already stated, parallax is simply the small angle filled up by the radius of the earth's orbit around the sun, as seen from the star.

TABLE OF AVERAGE STELLAR PARALLAXES (KAPTEYN).

MAGNITUDE OF STAR.	Proper Motion of Star.					
	0.02	0.05	0.10	0.20	0.50	1.0
5.	0.005	0.008	0.017	0.029	0.058	0.099
7.004	.007	.014	.024	.047	.081
9.003	.006	.011	.020	.039	.066

The divergences of actual measured parallaxes from the average numbers in the table enabled Kapteyn to estimate the probability of any given star really having the tabular parallax. He found that it is always at least an even chance that the real parallax will fall between one-half and one and one-fourth times the tabular value. This is a surprisingly close agreement between the theoretical formula on which the table is based, and the actual observed facts of nature.

Distribution of Stellar Velocities.—Kapteyn's researches concerning the distribution of stellar velocities have not been put in quite as definite a form as those just described. The problem he undertakes to solve is this: "What proportion of the stars have velocities of motion equal to, double, treble, etc., one-half, one-third, etc., of the velocity of our sun in space?" Adopting as the unit of stellar linear motion in space the velocity with which our own sun is moving, the problem is to find comparative data for other stars. We have an approximate knowledge of the sun's velocity, and we also know approximately the point in the sky towards which the solar motion is directed; and, as astronomers now consider our sun to be simply a star like other stars, it becomes a proper subject for stellar statistical inquiry to obtain, if possible, similar knowledge applicable throughout space.

Kapteyn found it necessary to adopt certain assumptions about the stars. These are fundamental; without them no progress at all would be possible in the problem under consideration. The first of these assumptions is that the actual motion of any star is just as likely *a priori* to take place in any one direction as is any other. All directions of motion are equally probable. The second assumption is that whatever may be the law of stellar velocities, it is the same at different distances from the solar system. In other words, our system is not a centre of space; and the proceedings and motions of other stars are quite independent of their position with respect to us. Both these assumptions are extremely plausible, and investigators are quite justified in making them; but assumptions they are, and as such affect *pro tanto* any conclusions that may be reached. Some of these conclusions we shall now summarize in the form in which they have been put by Newcomb in his last paper, to which reference has already been made. Newcomb adopts 4.75 kilometres per second as the unit of sidereal velocities; this being the rate of motion that would traverse the distance from the earth to the sun in one year. The rate of solar motion in space is just four times this unit; stellar statistics as to other stars are shown as follows—the first figure representing velocity in units and the second figure the number of stars having this velocity: 1—36; 10—59; 20—1; 30—1; 40—1; 50—1; 60—1. These figures show that the total number of visible stars having velocities vastly superior to that of our sun must be extremely small.

Luminosity of the Stars.—In his study of this question, Kapteyn begins by forming a table showing how many stars there are of each stellar magnitude, or degree of luminosity. The reader will remember that astronomers divide all visible stars into classes according to brightness; the most brilliant ones are classed as first magnitude stars, and those just on the limit of visibility by the unaided eye are classed as sixth magnitude. Theoretically each star of any class gives two-fifths as much light as stars of the class next above it; and by means of this fractional ratio the classification is extended to include telescopic stars below magnitude 6, and therefore invisible to the naked eye. Fractional numbers are used to designate degrees of brilliancy intermediate between the various magnitudes: thus, magnitude 1.5 would

be intermediate between the first and second magnitudes. The following is Kapteyn's table:

MAGNITUDES.	Approximate Average Magnitude.	Number of Stars.	MAGNITUDES.	Approximate Average Magnitude.	Number of Stars.
Brighter than 1.5 .	.	18	5.5 to 6.5	6.1	4,944
1.5 to 2.5	2.1	51	6.5 to 7.5	7.1	13,370
2.5 to 3.5	3.1	145	7.5 to 8.5	8.1	45,530
3.5 to 4.5	4.1	466	8.5 to 9.5	9.1	153,830
4.5 to 5.5	5.1	1,508			

Having thus obtained information as to the number of stars of each magnitude, Kapteyn proceeds to use it in connection with his former table of average stellar parallaxes corresponding to various magnitudes and proper motions. He begins by defining and adopting an absolute unit of stellar magnitude; for the previous luminosity classification is merely conventional and arbitrary. In fact, it is not essentially different from the system in general use ever since the time of Hipparchus. Of course the apparent magnitude of a star depends on its distance from us. With a given absolute brilliancy, it will appear brighter or fainter according as to whether it is near us or far away. Kapteyn therefore defines the *absolute magnitude* of a star as the magnitude it would appear to have if placed at such a distance from us that its parallax would be one-tenth of a second of arc, or, in other words, at such a distance that the radius of our earth's annual orbit about the sun would fill an angle of exactly that size to a supposed observer at the star. Under this definition our sun, regarded as a star, is of the absolute magnitude 5.5.

With the help of these considerations Kapteyn is now able to form a table showing the number of stars of given absolute magnitude situated between given limits of parallax or distance from us. From this he is finally able to deduce another table exhibiting the average number of stars of each absolute magnitude contained in a given section of cosmic space. As an example of his final result, Kapteyn imagines a portion of space containing two million stars of the same absolute magnitude as our sun, and then gives the following figures for stars of various other absolute magnitudes that would be contained at the same time in the same region of space; the first figure represents the number of stars and the second figure the luminosity of each of them as compared with the sun: 1—100,000; 38—10,000; 1800—1000; 3600—100; 440,000—10; 2,000,000—1; 5,000,000—0.1; 7,500,000—0.01.

The most immediate result of an inspection of these figures is that our sun, regarded as a star, is not such a little one as many suppose. Of the probable total of 15,000,000 stars contained in this region of space, only about one million are intrinsically brighter than our sun, and about 14 million are fainter than the sun. And the number of luminaries very many thousand times brighter than our sun is surprisingly small. We may, of course, take this region of space as a satisfactory specimen or sample of space, as a whole, for Kapteyn's results are averages, and he uses a sample portion of space of this size simply to visualize and make plain the results he has obtained.

These results are extremely interesting and highly valuable, and for this reason we have explained them here in considerable detail; but it would be unfair to close an account of Kapteyn's researches without emphasizing again that the conclusions reached are based in part on assumptions and hypotheses, and are therefore reliable only so far as these can be accepted. Some of these assumptions we have already mentioned, and have pointed out their great plausibility; but in so doing we attach to the final conclusions also the characterization of great plausibility, and not the definite certainty usually ascribed to astronomical science. Furthermore, in addition to these assumptions, Kapteyn's results are doubtless affected somewhat by unreliability or insufficiency in his observational data. For instance, our knowledge of proper motions is not complete or altogether accurate in the case of the fainter stars, for these have not been observed long enough or with sufficient precision. Again, the number of measured parallaxes is very small, and even some of these are doubtless faulty. Still, as average results, Kapteyn's tables are reliable; they are far better than anything we have had before; and they will always stand as remarkable examples of most acute analysis applied to a problem of surpassing difficulty.

Variation of Latitude.—Astronomers continuing in 1902 their measurements of changes in terrestrial latitude, brought to light a new fact of far-reaching importance. Küstner of Berlin was the first to demonstrate (1888) that observatories do not maintain an absolutely invariable distance from the North Pole of the earth. It is easy to understand the astronomical importance of this discovery, when we remember that all observations, and theories based on observations, have always been treated on the supposition of absolute invariability as regards latitude. Conse-

quently it has become necessary to revise astronomical fundamentals throughout; and this revision is now in progress. Even ordinary geography needs modification. Many boundary lines are defined by treaty as being coincident with certain parallels of latitude; and if these are subject to changes, treaties and geographies will also need revision.

Obviously the first and most necessary step has been the organization of a careful and systematic observational study of the problem, to be followed later by theoretical investigations into the mechanical causes of the effects observed. Küstner's original announcement was of course at once followed by many series of observations undertaken at various observatories and detached stations. Much time passed before arrangements could be made for a really satisfactory observational campaign; but this has been finally accomplished by the so-called International Geodetic Association. This organization is composed of representatives of the civilized governments of the world, which have joined forces for a more complete attack on pending problems of geodesy. These include, of course, the mapping and charting of our planet's surface primarily; but maps and charts would be worthless if longitude and latitude lines were not marked upon them, and since latitude lines are now recognized as subject to change, it naturally became the province of the association to study their variations. For this purpose observing stations have been established in Japan, California, Maryland, and Sicily, girdling the earth with a chain of latitude observers. The distributing of these stations was chosen most carefully: they are all on a single parallel of latitude (or very near it), a condition favorable astronomically to high precision in the results; and they are so distributed in longitude as to divide the earth into four nearly equal quadrants. This last condition is of great importance; for it gives a criterion as to whether the changes of latitude are due to actual motions of the earth's pole. If that pole at any given instant be moving away from one observing station, it must at the same instant be approaching the station diametrically opposite in longitude. In other words, periods of extra large latitudes in any one station must occur simultaneously with corresponding periods of extra small latitudes in the opposite station, while the intermediate stations should for the time being occupy comparatively unvarying latitudes.

Such were the supposed facts, as anticipated; and up to 1902 there was no evidence of anything different having an actual physical existence. Nor is it to be expected that the minutest details of this phenomenon should reveal themselves easily or speedily. The entire variation, as observed, has never exceeded half a second of arc, a quantity corresponding to about 50 feet only on the earth's surface. And it is of course possible that almost the whole change may be such as had been anticipated, and only differs from what was expected by a very small portion.

Kimura, observer at the Japanese station, was the first to suspect the reality of small variations of latitude not due to actual motions of the pole; and his suspicions have been verified by the publication of results from all four stations. These have been discussed upon a uniform system by Albrecht at Berlin. He finds that there are times when a small but decided increase of latitude takes place at all four stations simultaneously, something that for the reasons stated above cannot be due to mere motion of our pole. If this discovery be credited to Kimura, it may perhaps be called the most important scientific discovery that has come out of Asia in modern times. No explanation has yet been offered as to the cause of this observation; but the problem of latitude variation is entangled inextricably with the other problem of determining the so-called aberration of light. To "reduce" or compute our latitude observations we are compelled to assume that we are in possession of a correct theory as to the phenomena of aberration: and it is not improbable that these new observations will compel us to revise that theory, as well as re-determine the observational quantities that enter into the theoretical formulæ. The Kimura variation could be explained satisfactorily, and, indeed, be made to disappear, if we could find good theoretical grounds for applying at times a slightly varying "correction for aberration" to our latitude observations.

Light Pressure as a Cosmic Force.—Notwithstanding the immense progress of astronomy during the nineteenth century, many unsolved problems have been left to astronomers of the present day. An ingenious theory lately propounded by Svante Arrhenius, of Sweden, seems to give a ready explanation for many mysteries of the heavens that for generations have puzzled scientists. Among these may be mentioned: What are comets' tails composed of? and why do they always point away from the sun? What is the composition of the corona, the marvelous halo that at the time of a total eclipse is seen to surround the sun? and what the origin of the solar prominences? Again, what is the source of light by which the nebulae shine? What the origin and structure of meteor swarms? and what the aurora borealis? A theory that will solve these and half a dozen minor problems is of the greatest interest to every one. To make the idea of Arrhenius thoroughly intelligible, it is necessary to refer to certain work of J. J. Thomson, of England. He finds that

the atom is not the smallest possible subdivision of matter, even though it happens that in a cubic centimetre of gas there are ordinarily 20 million, million, million (2 followed by nineteen ciphers) molecules of gas. Thomson, however, has shown that the smallest of these bodies, the hydrogen atom, is about a thousand times as large as the "corpuscle," or "ion," and he further has found that these ions, each bearing a charge of negative electricity, are discharged with high velocity:— (1) from the negative electrode in a Crookes tube (kathode rays); (2) from objects struck by kathode rays (Rontgen rays); (3) from hot bodies; (4) from cold bodies under the influence of ultra-violet light; (5) from the radio-active substance, radium. This work of Thomson's, together with Maxwell's electromagnetic theory of light, form the groundwork of the theory proposed by Arrhenius for the solution of so many interesting problems in cosmology.

(a) *Explanation of Comets' Tails.*—Instead of pointing toward the sun in obedience to the law of gravitation, comets' tails always point in the diametrically opposite direction. The only explanation heretofore given for this fact was in imagining the sun the seat of some repulsive force whose exact nature no one seemed to be able to conjecture. Arrhenius explains this force by the action of light on the small particles composing the comet's tail. Maxwell found that sunlight at the surface of the earth should exert a pressure of $.592 \times 10^{-10}$ grams on every square centimetre—a force too small to be detected, although it has been looked for—but at the surface of the sun this pressure would reach the considerable amount of 2.75×10^{-3} grams per square centimetre. A cubic centimetre of water weighing one gram at the surface of the earth would weigh 27.47 grams at the sun's surface, and consequently the attraction of gravity would be 10,000 times the light repulsion tending to drive it away. But let us make our cube smaller than a cubic centimetre in volume. The light pressure depends on the area of the surface exposed, and so diminishes as the square of the edge, while the weight depends on the volume and diminishes as the cube. Decreasing the size of the particle, the weight is diminished faster than the pressure of light, and as a result, if the particle were a cube of water measuring one-thousandth of a millimetre on a side, the repulsion would be about equal to the attraction. Particles of water larger than this would fall to the sun, while those smaller would be repelled from the sun. One-thousandth of a millimetre is called a *micron*, denoted usually by μ , so that the critical value of the edge of a cube of water, i. e., the value for which its weight is exactly neutralized by the pressure of light at the sun's surface, is approximately μ . For a spherical drop, the critical value would be about 1.5μ . For other substances the critical value is inversely proportional to the specific gravity. This theory is in complete accord with that of Bredichin, who explained the cause of the curvature of different tails of a comet to be due to their being composed of substances of different specific gravities acted on by some repulsive force emanating from the sun, the hydrogen tail being less curved than the hydrocarbon tail. Arrhenius explains the nature of the repulsive force, and according to him the size of the drops in four particular cases investigated by Bredichin must have been 0.1μ , 0.59μ , 0.94μ , and 1.25μ respectively. Many anomalous facts in the appearance of comets and the formation of their tails now receive a ready explanation.

(b) *The Prominences and the Corona.*—The knowledge we have gained about the sun confirms the opinion that it is still in a gaseous condition. Radiation carries particles from the centre to the surface of the sun, and we are told by flash and prominence spectra that many vapors are projected into space. When these gases condense, the drops will, if larger than the critical size, fall back to the sun; and if smaller they will be thrown off into space, forming the streamers of the corona. Those particles that have approximately the critical diameter will float as clouds, giving rise to quiescent prominences. It has been difficult hitherto to explain how these prominences could exist without imagining an atmosphere about the sun, which would have to have the enormous extent of about half a million miles above the sun's surface. With Arrhenius's theory such an assumption is unnecessary, the prominences being sustained by the pressure of light.

(c) *The Zodiacal Light.*—Not only is the sun the source of the gaseous matter that causes the prominences, but as it is an intensely hot body, it will, according to Thomson, emit negatively charged ions. These ions serve as the nuclei of ordinary matter. The small particles ejected from the sun, each with its negatively electrified ion, will, when they encounter a body such as the earth, charge its outer atmosphere negatively, and when this charge reaches a certain value they will be repelled. The oncoming rush of particles will be deflected, and stream past the earth on both sides, the earth screening off the space immediately behind her. If we could take our stand on the moon and could look at the earth, we should see her with a sheaf of light projected from her towards the sun. This is probably the cause of zodiacal light.

(d) *Aurora Borealis and Terrestrial Magnetism.*—We are all familiar with the

appearance of the aurora, its beautiful darting, scintillating lights making it one of the most wonderful of natural phenomena. The peculiar color of the light reminds us of a discharge from an electrical machine, and as a result it has been felt by astronomers for many years that the northern lights are some electrical manifestation in the earth's atmosphere. The nature of this discharge, however, could not be determined satisfactorily until Arrhenius brought forward his theory. According to this the negative particles discharged from the sun must reach the earth most thickly over its equatorial regions. Before they reach an atmosphere dense enough to excite luminescence, they are caught by the lines of force of the earth's magnetic field. The particles follow these lines of force north and south, coming closer to the surface of the earth as they approach the earth's magnetic pole, over which the lines of force are vertical. Passing from the equatorial regions of the earth, the particles gradually reach lower layers of the atmosphere, and begin to give a discharge in appearance like that of a vacuum tube. But this discharge must be at the expense of energy, so that when they reach denser atmospheric layers, they have no more energy, and hence the dark circles around the magnetic poles. As these particles follow the lines of force, they ought to influence terrestrial magnetism, and as they emanate from the sun, the appearance of the aurora ought to be dependent on solar activity. A fine test of the theory will therefore be obtained if it is found that auroras, terrestrial magnetism, and solar activity vary together. It has been known for fifty years that the number of sunspots visible in a year, the amount of dip and declination of the compass needle, and the number of auroras all go through periods of 11.1 years, so that when a great number of sunspots are visible in any year, there are also a great number of auroras and a great variation of the magnetic needle. In fact, many instances have been noted where the sudden outburst of a sunspot has been accompanied with a brilliant aurora and also a "magnetic storm," during which compass needles vibrated wildly from side to side.

(e) *Meteorites*.—Negatively charged particles are ejected from the sun, and travel in all directions in inter-stellar space. Some of these particles moving with high velocity meet other particles from other suns, their high velocity overcomes the resistances to each other due to their similar charges, and the particles unite to form larger particles. Other particles are joined to this mass in the same way, giving an irregularly formed body highly charged with electricity. These are the meteors which from time to time dash through our atmosphere.

(f) *Nebulæ*.—When particles formed from smaller particles approach near the sun and have a diameter greater than the critical value, they will fall into the sun, to be in turn discharged into space. In this way there is an exchange of materials throughout the universe so that the stars are slowly becoming more and more alike in constitution. Countless millions of these particles, escaping from all visible suns, come into contact with nebulæ, which the spectroscope tells us are masses of gaseous material. The difficulty hitherto experienced in explaining the light of the nebulæ has come from the fact that these gases must be nearly at the intense cold of inter-stellar space. But how then do they become hot enough to be luminous? Arrhenius explains this anomaly, for according to his theory it is not necessary to suppose the mass heated throughout, but rather that the mass becomes luminous only on the outermost parts of the nebulæ, which at the same time may be of excessively low temperature.

New Gases in the Sun.—One of the most important lessons taught by the theory of Arrhenius is that particles of matter are continually being scattered throughout the universe, starting from one heavenly body and reaching another, with the result that all bodies of the universe are gradually becoming more and more alike. As a particular phase of this general idea, gases in the sun's atmosphere ought to be found in that of the earth. Those who are familiar with the spectroscope know of the yellow D₂ line, which plays such a prominent part in the spectra of the prominences and chromosphere. Its appearance puzzled spectroscopists for more than a quarter of a century, till in 1895 the substance "helium," which gives rise to the D₂ line, was found in the terrestrial mineral *clevite*. By utilizing the extremely low temperatures produced by liquid air and liquid hydrogen, it was found that atmospheric air contained several new gases. Argon was found in 1895 by Rayleigh and Ramsay, and in 1898 Ramsay discovered three other new gases, called neon, krypton, and xenon, present in air along with helium. As these five new gases are in atmospheric air, it would be interesting to see if they are also in the sun's atmosphere. Helium we know is in the sun, and it has lately been shown by investigations of spectra taken at the recent Sumatra eclipse, that neon and argon are certainly present in the neighborhood of the sun. It seems likely from certain theoretical considerations that krypton and xenon are also present, although none of their lines was detected in the photographic spectra.

These researches (made by Mitchell, of Columbia University) are interesting, as

they tell us something new about the sun, and also because they afford an independent verification of the theory of Arrhenius.

Disturbance in the Solar Corona.—To the astronomer, the most interesting feature of the corona of the 1901 eclipse, as shown by all photographs, was a disturbance in the northeast quadrant, which appeared as if some violent eruption were taking place. Nothing like this had ever been noted before. It remained for Professor Perrine, of the Lick Observatory, to show during 1902, that at the time of the eclipse a large sunspot was on the limb of the sun, directly under the disturbed region, the spot, by the rotation of the sun, being brought into view the next day. A thread-like prominence took its rise from the same region. Taking these observations in connection with the fact that the shape of the corona depends on the sunspot period, the corona being different in appearance when spots are a maximum and a minimum, we see that there is some intimate relation between the corona and prominences, and the activity of the sun as evidenced by spots. This again only bears further testimony to the correctness of the view of Arrhenius.

New Star in the Constellation Perseus.—Astronomers continued to devote much attention to this interesting object during 1902. First observed on February 22, 1901, by Anderson, of Edinburgh, it blazed up within a few hours until it almost equaled Sirius, the brightest star in the whole heavens. By February 24 it had begun to diminish in light, and by the latter part of March was only a rather inconspicuous telescopic star, quite invisible to the unaided eye. The latest observations of 1902 made it of about the 10th magnitude, so that it is now sending us light whose intensity is certainly not more than one three-millionth part of that which characterized the period of greatest brilliancy. In addition to its extraordinary momentary lucidity and rapid fluctuations of light, this *nova* exhibited some startling changes quite unique in the annals of astronomical observations. It was found on certain photographs that the star was surrounded by a nebula; and when pictures made on different dates were compared, this nebula was seen to be enlarging itself, widening out, as if the star were projecting matter outward into space with extraordinary velocity and almost incredible mechanical energy. It is possible that this phenomenon, though never previously observed in the case of any of the few bright *novæ* so far recorded by astronomers, may nevertheless not really be unique. For we must remember that to the present object astronomers have applied a new and very efficient method of observation, photography, with long-continued exposure to the feeble nebular light. It is conceivable that similar nebular expansions may have occurred also in the case of other *novæ*, but escaped detection by the older methods of observation. Even in the present case, the nebular observations were exclusively photographic, and nothing has been seen of these phenomena by eye and telescope alone.

The rapid fading out of the new star has limited somewhat the possibility of adding new knowledge of importance to our stock of facts about its nebular surroundings. But the star itself remained bright enough to make possible observation throughout a large fraction of a year with instruments suitable for the determination of stellar distances. The most accurate instrument for this purpose is the "heliometer," but existing instruments of this type do not permit the observation of stars fainter than about the 8th magnitude. Furthermore, to determine a star's distance it is theoretically necessary to observe it throughout six months at the very least. But the new star, as we have said, remained bright long enough; and so we have this year come into possession for the first time, of reliable knowledge as to the "parallax" of a "new star." In other words, we have obtained an approximate knowledge of the new star's distance.

This is of course important in the last degree, if an effort is to be made to explain the expanding nebula. Since we have photographs covering a rather long period of time, we can by measurement of these ascertain how much the nebula expanded in a given time unit. In other words, we obtain the rate per second at which the nebula, as seen on the sky, was apparently growing bigger. But this apparent rate of increase would of course mean much more motion if the nebula were very far away than it would mean if the nebula were comparatively near us in space. A given linear motion of 100 miles per second, for instance, would appear 100 times as big when seen at a distance (say) of 100 million miles, as it would if seen at a distance of 10,000 million miles.

Consequently, while we can measure the apparent increase in size of the nebula per second from the photographs, we can learn nothing from this about the actual linear velocity of motion, unless we can obtain an estimate of the star's distance from us. This estimate we now have from the parallax observations of at least two heliometers and one photographic telescope. The united evidence is conclusive that the star is so far away from us that its parallax is too small to be measured. The most that can be done observationally in this direction is to fix a limit within which the star is certainly not situated. But, as we have seen, the

further away our star is, the greater must be the linear velocity of motion to make the apparent growth of the nebula per second as large as we have measured from the photographs. Using the limit of distance, as determined, we can thus fix a corresponding limit of actual linear velocity for the rate of growth of the nebula. We can say with certainty that the nebula moved outward a certain number of miles per second, or more than that, but certainly not less.

Now the smallest linear velocity that will thus satisfy reasonably the parallax observations and those of the nebula itself is equal to the known velocity of light, about 180,000 miles per second. It is absolutely inconceivable that matter of any kind we know of, solid, liquid, or even gaseous, should be projected with any such velocity. Therefore astronomers have been led to abandon the idea that the nebular expansion is really matter being thrown outward into space from the star. They have adopted the ingenious notion that the occurrence of the known velocity of light as a limit of speed is not a mere coincidence. It may indeed be a fact that the star is not sending out nebulous matter at all, but is really only distributing light. This light, as it travels outward, might meet with some nebular matter previously dark, and while this was temporarily illuminated by the light, we should see it. Remembering that the star was extremely luminous for a short time only, we should naturally expect such illuminated nebular matter to be also visible temporarily only. On the whole, we consider this explanation to be the most plausible one thus far advanced to account for the new star's extraordinary nebular attendant. Nor does this theory interfere in the least with the earlier explanation that the cause of the star's own outburst into luminosity was a collision between two masses of dark matter. For in that case also it would be quite reasonable to expect to find more dark matter in existence near the spot where the collision had occurred. The whole theory fits together very well, and is to be regarded as a sufficiently satisfactory explanation of a somewhat obscure phenomenon.

Comets.—The first comet of 1902 was discovered by Brooks, April 15. No observations of it were obtained after April 19, as it passed to an unfavorable part of the sky. The second comet was discovered by Perrine, August 31, and independently by Borely the following day. It was easily visible to the naked eye in October when the moon was absent from the sky. A third comet is said to have been seen by Griggs on July 23, but no one else has observed it.

Planetoids.—The following minor planets have been officially added to the list since No. 469, the last one mentioned in the YEAR BOOK for 1901.

NUMBER.	Temporary Designation.	Date of Discovery.	Discoverer.	Name.
470	GJ	1901, April 21	Carnera	Killa
471	GN	June 7	Wolf
472	GP	July 11	Wolf	Roma
473	GC	Feb. 13	Wolf
474	GD	Feb. 13	Wolf

ASYLUMS FOR INSANE. See INSANITY.

ATHERTON, GERTRUDE FRANKLIN, an American author whose book *The Conqueror*, a novel having Alexander Hamilton as its central figure, was one of the popular successes of 1902, was born in 1859, in San Francisco, Cal. She has been occupied with literary work since 1888, and since 1894 has lived abroad, chiefly in London, where her books have gained great popularity. Her *Senator North* (1900), a study of political and social life in Washington, D. C., received considerable critical attention, and *The Aristocrats*, which was published anonymously in 1901, was called by many one of the cleverest books of the year. Among her other works are *The Doomswoman* (1892); *Before the Gringo Came* (1894); *A Whirl Asunder* (1895); *Patience Sparhawk* (1897); *American Wives and English Husbands* (1898); *The Californians* (1898); *The Valiant Runaways* (1899), and *The Splendid Idle Forties* (1902).

ATHLETICS, TRACK AND FIELD. The year 1902 was notable in athletics, not from any abundance of remarkable performances but from the fact that the one

record which had been considered by experts as likely never to be broken, was surpassed on May 31 at the intercollegiate games when Arthur F. Duffey, of Georgetown University, ran 100 yards in 9.3-5 seconds. This performance occurred under perfect conditions, as to weather and timing, and marks Duffey as the greatest sprinter in the world. The previous record, of 9.4-5 seconds, was made by John Owen, Jr., in 1890, at Washington, D. C., and was held subsequently by several others. Other world's records bettered during the year were: Throwing the discus, to 127 feet, 8¾ inches, by M. J. Sheridan; and the relay race, 2 miles, lowered to 8 minutes 4.4-5 seconds, by the Harvard team, Boynton, Adams, Du Boise, and Baer. There was no international meeting, but on July 5, at Stamford Bridge, Duffey won the English championship at 100 yards in 10 seconds. At the same meeting, S. S. Jones, of New York University and the New York Athletic Club, won the high-jump at 6 feet 3 inches.

The twenty-seventh annual games of the Intercollegiate Athletic Association were held at Berkeley Oval, New York, on May 30 and 31, the winners being as follows: One hundred yards dash, A. F. Duffey, Georgetown, 9.3-5 seconds; 120 yards hurdles, I. H. Converse, Harvard, 15.3-5 seconds; 440 yards dash, W. J. Holland, Georgetown, 49.1-5 seconds; one mile run, R. E. Williams, Princeton, 4 minutes 29.1-5 seconds; two mile run, A. C. Bowen, Pennsylvania, 9 minutes 57 seconds; 220 yards hurdles, I. G. Willis, Harvard, 23.4-5 seconds; one-half mile run, H. E. Taylor, Amherst, 2 minutes 0.3-5 seconds; 220 yards dash, M. T. Lightner, Harvard, 21.3-5 seconds; putting 16-pound shot, F. G. Beck, Yale, 44 feet 8½ inches; running high-jump, W. C. Low, Syracuse, 5 feet 11 inches; pole-vault, D. S. Horton, Princeton, 11 feet 3 inches; throwing 16-pound hammer, J. R. De Witt, Princeton, 164 feet 10 inches; running broad-jump, A. T. Foster, Amherst, 21 feet 11 inches. On the basis of five points for first place, three for second, two for third and one for fourth, Harvard won the meet with 34 points. The other colleges scored as follows: Yale 30, Princeton 27, Amherst 11, Georgetown 10, Pennsylvania 9, California 8, Syracuse 8, Columbia 3, Cornell 3. Later in the year, W. A. Schick, of Harvard, who had finished second in both the 100 yards and 220 yards dashes, was disqualified by the Association, thus giving first place to Yale. The specific protest against Schick was for violation of the one-year residence rule. The disqualification also reversed the result of the Yale-Harvard meet of May 24, 1902, which had been won by Harvard at 61½ points to 42½. The transfer of the 10 points won by Schick in the dashes made Yale the winner, 52½ to 51½. Other dual meets were: Yale 8.5-6, California 4.1-6 (only first place counted); California 7, Princeton 6 (firsts only); Princeton 63½, Amherst 53½; Cornell 77, Princeton 40; Pennsylvania 82, Columbia 35; Cornell, 67, Pennsylvania 50; Chicago 8, California 5 (firsts only); California 78½, Leland Stanford 43½.

The meeting of the New England Intercollegiate Athletic Association at Worcester, Mass., May 24, 1902, was won by Amherst with 36 points. Dartmouth was second with 28½ points and Brown third with 19. The Western Intercollegiate Association met at Chicago on May 31. Michigan won with 36 points, followed by Chicago 25, Wisconsin 19, Drake 10, Minnesota 9, Beloit 8, Illinois 6, Notre Dame 5, Iowa 5, Northwestern 3. Abroad, on March 22, Oxford won from Cambridge by 5 events to 4.

The Amateur Athletic Union held its championships at Travers Island, N. Y., on September 13, 1902, but bad weather prevented any notable performances. The New York Athletic Club team won most of the events.

At the Canadian championships held at Montreal, September 20, seven out of the eleven events were won by Americans, the best performer being A. Grant, of the New York Athletic Club, who lowered the Canadian five-mile record to 27 minutes 18.1-5 seconds. The all-around championship of the Amateur Athletic Union went to A. B. Gunn, of Buffalo, for the second time, by a score of 6260½ points. The seventh annual Marathon road-race over the Ashland-Boston course (24 miles 1478.4 yards) was held on April 19, 1902, and was won by S. Mellor, Jr., of Yonkers, N. Y., in 2 hours 43 minutes 15.2-5 seconds.

ATOMIC WEIGHTS. See CHEMISTRY (paragraph Atomic Weights).

ATOXYL, a new arsenic compound, $C_6H_5NHAsO_2$, designed to take the place of the more irritating preparations, when a high dosage is required. It is given hypodermically in solution for chronic skin diseases such as psoriasis, diabetic xanthoma, lichen ruber, chronic exfoliative dermatitis, etc., and for alopecia areata (baldness) and malignant growths. The best results have been obtained in skin troubles. The drug is a white, odorless powder, having a salty taste, and soluble in warm water.

AUDUBON SOCIETIES. See ORNITHOLOGY.

AURORA BOREALIS. See ASTRONOMICAL PROGRESS.

AUSTRALIA, COMMONWEALTH OF, a British colonial possession comprising the five states of New South Wales, Queensland, South Australia, Victoria, and Western Australia, on the Australian continent, and the island state of Tasmania.

Area and Population.—The total estimated area of the commonwealth is 2,973,976 square miles, and the population in 1901 was 3,767,443, an increase from 3,174,253 in 1891. The populations of the several states in 1901 were as follows: New South Wales, 1,352,297; Queensland, 496,596; South Australia, 362,604; Victoria, 1,200,918; Western Australia, 182,553; and Tasmania, 172,475.

Government and Finance.—The commonwealth constitution was adopted by the several states in 1900 and went into effect on January 1, 1901. The executive power, vested in the King of Great Britain, is exercised by a governor-general appointed by him and advised by an executive council of seven ministers responsible to the federal Parliament, in which the legislative power is vested. The Parliament, which meets annually, consists of two houses—the Senate, composed of 6 members from each state, elected for six years, and the House of Representatives, consisting of 75 members, elected for a three-year term from the several states according to the following apportionment: New South Wales, 26; Victoria, 23; Queensland, 9; South Australia, 7; Western Australia, 5; Tasmania, 5. The legislative powers of the Parliament are extensive, applying, among other things, to commerce, railways, shipping, finance, posts and telegraphs, immigration, banking, currency, industrial regulation, and defense. Powers not transferred by the constitution to the federal Parliament are reserved to the state legislatures. The House of Representatives has special powers in respect to appropriation bills. There is to be a federal judiciary—at the head of which is a high (supreme) court, which hears appeals from the lower federal courts and the supreme courts of the states (see paragraphs on History). There is free trade between the states of the commonwealth, and a federal customs tariff is provided for. Further, the constitution provides that for ten years after January 1, 1901, the annual federal expenditure must not exceed one-fourth of the revenue derived from federal customs and excise, and that the surplus thus created shall be returned to the states, or used for the payment of debts taken over by the commonwealth.

The governor-general from the inauguration of the commonwealth up to July, 1902, was the Rt. Hon. John Adrian Louis Hope, Earl of Hopetoun. (See paragraph Lord Hopetoun's Resignation.) On November 21, 1902, it was announced that Lord (Hallam) Tennyson, formerly governor of South Australia, had been appointed governor-general of the commonwealth to succeed Lord Hopetoun for a term of one year. The commonwealth ministry appointed in 1901 underwent no changes during 1902. It was constituted as follows: Premier and minister for external affairs, Rt. Hon. Edmund P. Barton, New South Wales; attorney-general, Hon. Alfred Deakin, Victoria; minister for home affairs, Sir William J. Lyne, New South Wales; treasurer, Sir George Turner, Victoria; minister of trade and commerce, Hon. Charles C. Kingston, South Australia; minister of defense, Sir John Forrest, Western Australia; postmaster-general, Hon. James G. Drake, Queensland.

The statement of federal finance for the year 1901-02, as submitted to the commonwealth Parliament in September, 1902, showed a revenue for the fiscal year amounting to £11,288,903. Of this amount customs yielded £8,894,819, and posts and telegraphs £2,364,873. The expenditure amounted to £3,926,806, the principal items of which were: Postoffice, £2,336,465; defense, £856,400; and customs administration, £262,092. This left a balance to be returned to the states of £7,368,418, which was £519,000 more than was anticipated in the estimates. The amount was divided among the several states as follows: New South Wales, £2,385,905; Victoria, £1,920,974; Queensland, £904,775; South Australia, £616,148; Western Australia, £1,225,076; and Tasmania, £315,540. The revenue for the year 1902-03 was estimated at £11,510,104, of which it was expected customs and excise would furnish £9,055,000, and the postoffice £2,444,400.

Federal Defense.—The relations of the commonwealth to Great Britain, particularly in regard to provisions for federal defense, assumed during 1902 great importance by reason of a rearrangement of the agreement between Australia and the imperial government as to naval defense and a proposed reorganization of the land forces. The existing agreement as to naval defense, entered into in 1887, provided for the equipment and maintenance in Australian waters of a fleet of five fast cruisers and two torpedo boats. It was provided at that time that the several Australian states and New Zealand should pay interest at the rate of 5 per cent. on the original cost, and also the cost of maintenance which was not to exceed £91,000 annually. The total subsidy, including interest paid by the states, amounted in 1899-1900 to £126,000. It was further provided that the squadron should not be withdrawn from Australian waters in case of war. The vessels are now growing obsolete and have little fighting value, and with the question of

replacing them has arisen the question as to whether the system is the most advantageous that can be devised for the commonwealth. During the first year of the commonwealth's existence a strong movement manifested itself for a termination of the old arrangement, and the construction and maintenance of a purely Australian fleet. To such a proposition the British admiralty is unalterably opposed. On the other hand the Barton ministry was supposed to be rather favorable to the change. Mr. Joseph Chamberlain, the British colonial secretary, declared at the conference of colonial premiers (see GREAT BRITAIN, paragraph Colonial Conference), which convened at London, June 30, 1902, that it was unfair that Great Britain should be forced to continue to supply such a disproportionate amount for imperial defense, which is as vital a question to the colonies as to the mother country. Later conferences were held between Lord Selborne, first lord of the admiralty, and Sir Edmund Barton and Sir John Forrest, by which the latter agreed that the commonwealth (exclusive of New Zealand) should contribute £200,000 annually toward the cost of an improved Australian squadron to be maintained in Australian waters under an arrangement similar to the existing one, and for the establishment of a branch of the Royal Naval Reserve. The agreement, if ratified by the commonwealth Parliament, was to hold good for ten years, and although under its provisions the annual contribution of Australia was practically doubled, Lord Selborne pointed out that the effectiveness of the defense would be more than doubled by the increase in size and equipment of the new squadron, and that the money contribution amounted to only 1s. 03½d. per capita, or little more than 1 per cent. of the charge for the navy borne by the taxpayers of the United Kingdom. In the same conference, the attempt to reach an agreement on the suggestion of Mr. Brodrick, secretary of state for war, looking toward the establishment in all the colonies of a specially trained force that should constitute a part of the army reserve of the imperial forces, was opposed by the Australian representatives, who held with the Canadians that it would be better to raise the standard of training for the general body of the colonial forces, leaving it to the colony, in any emergency, to determine the character and extent of its contribution to the imperial defense. In line with this position Premier Barton announced in November, 1902, that a bill would be introduced welding the separate military systems of the several states into a consistent organization on a more effective basis. The proposal provided for an increase of the field force from 14,000 to 28,748, making, with the garrison corps, a total of 44,218 men.

The Federal Tariff.—The Commonwealth act which provided for inter-state free trade also provided that within two years from the date of the establishment of the federal government, a uniform system of tariff duties should be established. The federal parliamentary elections in March, 1901, turned largely upon the question of the tariff and resulted in the selection of a Senate in which the free-traders and low tariff advocates had a small majority and a House of Representatives in which the protectionists and moderate tariff party could count on a majority in favor of a moderately high tariff. The government tariff bill introduced in the House on October 8, 1901, was practically a protective measure. Realizing that in its original shape the bill would stand no chance of acceptance by the Senate, the moderates joined with the free-traders in the House to effect a reduction. The bill was the principal subject of debate in the House for several months. By the end of March, 1902, the revision had been practically completed. In most cases a compromise between the government schedules and the alternative demands of the opposition was agreed upon, and tea, kerosene, and other staple articles of universal consumption were put on the free list. A provision for the collection of duties on articles imported by the various states was added to the bill, in spite of the objection of the free-traders and states-rights party, who declared that the clause violated that section of the constitution which provides that state property be exempt from taxation. In this form the bill went to the Senate in April. Immediately the Senate majority set about a wholesale reduction of the House bill schedules, showing no disposition to listen to compromise. In vain the government leaders warned the free-traders that their action would provoke a quarrel with the House involving grave constitutional issues. Almost completely shorn of its protective provisions the bill was at length sent back to the House. The Senate's powers over finance bills do not include amendment, but take the form of requests to the lower house to omit such provisions as it will not agree to. On August 14 the House considered and rejected all the Senate's requests for reduction. A prolonged deadlock with consequent dissolution was threatened, when the ministry determined that rather than face such a crisis they would accept a moderate tariff, trusting to future legislation to establish the protective system they had planned. They therefore called in consultation the government leaders in both houses, and proposed compromises on the disputed points which were accepted, although with

rather bad grace. The bill as thus agreed upon was passed September 9, and assented to September 16.

An Australian "Monroe Doctrine."—The insistence in Australia that Great Britain shall set bounds to the further extension of the territorial acquisition of Germany, France, or any other European country in the Australasian and South seas was shown during 1902 in the feeling aroused in the commonwealth by a report that Great Britain was contemplating giving up her share in the New Hebrides to France, with whom the islands are now jointly administered, in exchange for a withdrawal of the French claims to the Newfoundland fisheries. Although no official statement has been made in regard to such an agreement, Premier Barton took a hand and cabled to Mr. Chamberlain that the Australian commonwealth would never consent to the complete establishment of French sovereignty in the islands.

The Drought and the Economic Situation.—The year 1902 was the seventh successive year in which a severe drought prevailed in Australia. The industrial and commercial life of the country has been greatly affected, and it is estimated that, in the year ending in September, 1902, the losses of sheep and lambs alone amounted to over 40,000,000 head. Many of the waterways in the interior have become unnavigable, and unemployed men are drifting into the cities by thousands. During 1902 there was a steady emigration to South Africa. In December it was stated that in a little more than three months 6350 adults with £200,000 had left for South Africa. Of these, 1670 went from Victoria alone, a state whose high-tariff and wages-boards represented more nearly the triumph of labor politics than any other state in the commonwealth. Prices for all necessities have advanced enormously, and the ranks of the unemployed are increasing daily. The opponents of state socialism and the labor legislation programme attribute the economic depression to the application of these policies. A London *Times* correspondent declares that "the right to work is rapidly being expanded into a right to wages, with or without work. The state cannot invent work fast enough for the thousands who have been taught to look to it for employment more remunerative and less onerous than can be offered them by private enterprise; but it can, and is expected to, pay wages, and the wage-bill which the state has to meet is growing with alarming rapidity, and entirely out of proportion to the value and usefulness of the work it represents."

Lord Hopetoun's Resignation.—In May, 1902, Premier Barton on behalf of the ministry introduced a bill in the House providing for an annual allowance of £8000 for Lord Hopetoun, to enable him to recoup himself for the expense necessary for the maintenance of government houses in both Sydney and Melbourne, pending the completion of the new federal capital. The House refused a permanent annual grant, but voted the sum of £10,000 toward the expense incurred by the governor during the visit of the Prince of Wales in 1901. After the refusal of the House to supplement his salary, Lord Hopetoun cabled to Mr. Chamberlain his resignation as governor-general, declaring that the demands on his private purse were greater than he could stand. It was semi-officially stated on May 20 that Lord Hopetoun considered that the federal government had broken faith with him. The refusal to grant the allowance asked had, it was said, the effect of practically cutting his salary to £6000, as his salary was only £10,000, and no provision was made for the payment of a staff or for state entertainments. He had already, it was explained, spent over £25,000 out of his private purse.

The Immigration Question.—Toward the end of 1902 a serious difficulty arose from the enforcement of the provisions of the immigration restriction act passed late in 1901. It was just such a difficulty as its opponents had pointed out would occur sooner or later. The law, which was designed to exclude Chinese, Japanese, and South Sea islander immigration, provided that every immigrant should be required to write out at dictation and sign in the presence of an immigration officer, a passage of fifty words in some European language. A further clause provided that contract laborers, unless skilled, should be excluded. Early in December, 1902, six British workmen, who had arrived on the steamship *Orontes*, under contract with a clothing manufacturer, were refused permission to land under this act. After considerable exchange of communications between the premier and the British colonial office, Sir Edmund Barton decided, despite the remonstrances of the Labor party, that the men were skilled, and allowed them to land. The incident was looked upon as a warning that unless repealed the act would give rise to further friction between the commonwealth and imperial government, as the former will find it difficult to pacify the powerful labor element if it evades the act, as it unquestionably did in the present instance.

Other Matters.—In April, 1902, the House committee on decimal coinage reported in favor of the adoption of a decimal coinage system based on the sovereign. In the same month, imperial penny postage was adopted for the commonwealth for

all ingoing letters, although the outward rate was kept at 2½d. In March the House passed a bill for the establishment of a federal court of justice, as provided for in the constitution, but the measure was coldly received in the Senate, and up to the end of the year had not been accepted by them. See NEW SOUTH WALES, QUEENSLAND, SOUTH AUSTRALIA, TASMANIA, VICTORIA, and WESTERN AUSTRALIA.

AUSTRIA-HUNGARY, a constitutional monarchy of central Europe comprising the empire of Austria and kingdom of Hungary, united under one sovereign. The capital of Austria is Vienna, and of Hungary Budapest.

Area and Population.—The monarchy has a total area of 240,942 square miles, of which Austria comprises 115,903 square miles, and Hungary (including Croatia and Slavonia, 16,773 square miles) 125,039 square miles. According to the revised figures of the census of December 31, 1900, the population was as follows: Austria, 26,150,708; Hungary, 16,838,255; Croatia and Slavonia, 2,416,304—total 45,405,267. The leading nationalities in Austria and Hungary (including Croatia and Slavonia) respectively were as follows: Germans, 9,170,939 and 2,135,181; Magyars, 9516 and 8,724,301; Czechs, Moravians, and Slovaks, 5,955,397 and 2,019,641; Ruthenians, 3,375,576 and 429,477; Croats and Servians, 711,380 and 2,730,749; Roumanians, 230,963 and 2,799,479; Italians and Ladins, 727,102 (in Austria). According to religion, there were in Austria and Hungary (including Croatia and Slavonia), respectively: Roman Catholics, 20,660,279 and 9,919,913; Greek and Armenian Catholics, 3,136,535 and 1,854,143; Orthodox Greeks, 606,704 and 2,815,713; Evangelicals (Helvetian Confession), 128,557 and 2,441,142; Jews, 1,224,899 and 851,378; Evangelicals (Augsburg Confession), 365,454 and 1,288,942. Vienna had 1,674,957 inhabitants and Budapest 716,476. Religious toleration prevails, but the emperor-king must be a member of the Roman Catholic Church. Elementary instruction is free and compulsory.

Common Government and Finance.—The executive authority rests with the common sovereign. Franz Josef I. has been emperor of Austria since December, 1848, and king of Hungary since June, 1867. Under the constitutional compromise of 1867, known as the *Ausgleich*, the common administration is directed by the emperor-king, assisted by a ministry of three members, for foreign affairs, finance, and war, who are responsible to a common legislature called the Delegations. Each of these consists of sixty members, the one body representing Austria and the other Hungary, and they convene each year alternately at Vienna and at Budapest. The common government deals with foreign affairs, the army, the navy, finance relating to the monarchy as a whole, certain state monopolies, and the diplomatic, postal, and telegraphic services. The composition of the ministry in 1902 was: For foreign affairs, Count Agenor M. A. Goluchowski (since May, 1895); for finance, Benjamin Kállay de Nagy-Kálló (since June, 1882); for war, Lieutenant-General von Pitreich (since December, 1902).

The proportion of the common expense to be borne by Austria and Hungary was established by an agreement of 1867, renewable every ten years. This agreement, which together with a number of economic and customs measures was a part of the *Ausgleich*, was not renewed in 1897 and two years later was dissolved. It was superseded in 1899 by a reciprocity treaty (in force under certain conditions until December 31, 1907), which provides that the common expenses of the monarchy be paid in the proportion of 65.6 per cent. for Austria and 34.4 per cent. for Hungary. See paragraph *Ausgleich*.

The monetary standard is gold and the unit of value the krone, worth 20.3 cents. According to the sanctioned estimates, the revenue and expenditure for 1900 balanced at 337,348,000 kronen; for 1901, revenue 364,337,000 kronen, and expenditure 337,000,000 kronen; for 1902 they balanced at 365,181,966 kronen; 1903, 372,438,000 kronen. These estimates show receipts from customs as follows: 1900, 124,950,000 kronen; 1901, 125,039,249 kronen; 1902, 110,541,299 kronen. The largest item of expenditure is for the army.

Joint debts are not contracted. A debt, however, was assumed in common when the union of the monarchy was effected in 1867, and this in 1901 amounted to 5,434,428,306 kronen, the charges being 189,028,560 kronen for Austria and 60,577,662 kronen for Hungary.

Army and Navy.—The peace strength of the Austro-Hungarian army in 1901 is reported as follows: The common army, consisting of fifteen army corps, had 304,293 officers and men; the Austrian Landwehr, 27,729; the Hungarian Honvédség, 27,856; total active army, 359,878 officers and men. On a war footing the army numbers about 1,872,000.

The Austro-Hungarian fleet was reported to comprise in March, 1902, 3 second-class battleships, 4 third-class battleships, 2 armored cruisers, 8 protected cruisers, 7 port-defense vessels, 12 torpedo gunboats, 32 first-class torpedo boats, 32 second-class torpedo boats, and 8 third-class torpedo boats. The fleet is being gradually developed and old vessels replaced by new ones. In 1902 the substitute battleships

Lauson and Drache were laid down. Each will have a displacement of 10,600 tons, indicated horse-power 14,000, and speed 19 knots. See MANŒUVRES, MILITARY AND NAVAL.

Government and Finance of Austria.—The executive authority is vested in the emperor, under whom the administration is carried on through a ministry of ten members appointed by him and responsible to the legislative body, the Reichsrath. This consists of an upper house (Herrenhaus) and a lower house (Abgeordnetenhaus); membership in the former is appointive and hereditary, and in the latter elective. In 1902 the premier and minister of the interior was Dr. Ernst von Koerber (appointed January 21, 1900). Each province has a representative diet (Landtag), which deals with matters not reserved for the Reichsrath.

The revenue and expenditure in kronen (20.3 cents) have been estimated as follows, respectively: 1901, 1,641,997,585 and 1,641,163,344; 1902, 1,685,966,357 and 1,685,117,944; 1903, 1,690,182,264 and 1,689,116,863. The consolidated debt in 1901 amounted to 3,608,140,700 kronen, and the floating debt 13,017,082 kronen—total, 3,621,157,782 kronen. Interest and amortization amounted to 150,813,218 kronen.

Government and Finance of Hungary.—As in Austria, the executive authority in Hungary, including Croatia and Slavonia, is vested in the sovereign, and under him the administration is directed by a ministry of nine members, whom he appoints and who are responsible to the parliament (Országgyűlés). This body is bicameral, membership in the upper house being largely hereditary, appointive, and *ex-officio*, and in the lower house elective by popular vote. Though represented in the parliament, Croatia-Slavonia has a separate diet. In 1902 the Hungarian premier and minister of the interior was Koloman de Szell (appointed in February, 1899).

In 1900 the revenue and expenditure in kronen were 1,197,036,000 and 1,083,521,000, respectively. The estimate in kronen for 1901 was 1,056,582,297 for revenue, and 1,056,556,517 for expenditure; for 1902, revenue, 1,086,870,018, and expenditure 1,086,749,083. In 1900 the consolidated debt amounted to 2,284,580,000 kronen and the total debt 5,186,323,000 kronen.

Industries.—In both Austria and Hungary agriculture is the leading industry. Manufacturing industries, which are developing, have gained so much more importance in Austria than in Hungary, that this difference affords one of the leading points of dispute between the two parts of the monarchy in the matter of establishing a new customs tariff. Valuable mineral deposits are worked in both countries, but not to the best advantage. In 1900 the production in hectolitres (2.838 bushels) of the leading crops in Austria was: Oats, 37,021,000; barley, 20,525,000; rye, 19,906,000; wheat, 14,741,000; while in metric centners (220.46 pounds) potatoes amounted to 117,020,000; sugar beets, 52,282,000; other beets, 27,648,000. In Hungary production in metric centners in 1900 was: Potatoes, 48,622,000; sugar beets, 19,857,000; other beets, 43,794,000; wheat, 41,432,000; barley, 12,362,000; oats, 11,061,000; rye, 10,793,000. Nearly half of the beets are raised in Bohemia. In 1900 the reported values of mining and furnace products in Austria were 233,454,480 kronen and 99,975,800 kronen, respectively; in Hungary, 63,142,700 and 56,037,900, respectively. During 1901 and 1902 serious economic depression, especially in the manufacturing industries, prevailed in Austria-Hungary. This, augmenting the stress of competition, was doubtless an important factor in the formation of a kartel, or combination, of the iron and steel industries, comprising twenty-three separate establishments, with an aggregate capital of 280,000,000 kronen. After months of negotiations the formation of this trust was announced in November, 1902. The trust, in fact, consists of two kartels, one of eighteen Austrian establishments and the other of five Hungarian, but the two are managed jointly by a central authority, which regulates output and fixes prices for the several separate establishments. The organization includes practically every important iron and steel interest in Austria-Hungary, such as raw iron, bars, plates, rails, nails, and wire. The scheme is to remain in force until June 30, 1912.

Commerce.—The special commerce (imports for consumption and exports of domestic produce) of the customs territory, including Bosnia and Herzegovina (*q.v.*), has been as follows in kronen, the trade in specie and bullion being excluded:

	1898	1899	1900	1901
Imports.....	1,639,602,000	1,608,870,000	1,696,358,000	1,652,643,000
Exports.....	1,615,244,000	1,861,592,000	1,942,003,000	1,382,458,000

In 1900 imports and exports of specie and bullion amounted to 44,897,000 kronen and 66,546,000 kronen, respectively, and in 1901 to 173,485,000 and 41,845,000, respectively. The values in kronen of the leading imports in 1901 were: Cotton, 142,800,000; coal, 107,700,000; wool, 90,800,000; tobacco, 56,200,000; skins, 46,300,000; books, etc.,

43,500,000; leather, 43,100,000; machinery, 42,300,000; coffee, 41,000,000; silk, 38,000,000; cereals, 36,900,000. The leading exports in 1901 included: Wood, 219,400,000 kronen; sugar, 176,700,000; cattle, etc., 120,600,000; coal, 105,800,000; eggs, 96,500,000; cereals, 89,200,000; leather goods, 50,800,000; glass, 49,100,000; malt, 46,200,000; woolen goods, 44,000,000; wooden wares, 43,000,000; skins, 39,000,000; jewelry, 38,900,000; paper, 30,700,000. Imports from and exports to the countries of greatest commercial importance in 1900 and 1901 were valued in kronen as follows:

COUNTRIES.	Imports.		Exports	
	1900	1901	1900	1901
Germany.....	635,375,000	634,559,000	1,016,340,000	977,776,000
Great Britain.....	148,942,000	136,539,000	201,250,000	186,880,000
United States.....	152,823,000	128,516,000	37,935,000	32,700,000
Italy.....	114,297,000	104,097,000	146,987,000	136,473,000
British India.....	84,242,000	95,339,000	45,650,000	60,364,000
Russia.....	89,149,000	86,258,000	71,661,000	72,734,000
France.....	53,864,000	55,468,000	68,430,000	65,155,000
Switzerland.....	56,299,000	49,235,000	68,630,000	64,428,000
Servia.....	42,213,000	41,986,000	24,174,000	22,634,000
Roumania.....	32,227,000	33,249,000	43,211,000	47,806,000
Brazil.....	43,489,000	37,782,900	5,864,000	6,489,000

Communications.—At the beginning of 1902 there were in operation in Austria 19,270 kilometres (11,974 miles) of railway, and in Hungary 17,101 kilometres (10,626 miles)—total, 36,371 kilometres (22,600 miles). The canal mileage navigable for steamers has been reported at 818 in Austria and 1923 in Hungary. In 1900 there were 7070 postoffices in Austria and 4923 in Hungary, besides 31 foreign offices. In the same year Austria had 5463 telegraph offices, with 39,405 kilometres (24,485 miles) of line, and 176,651 kilometres (109,766 miles) of wire, and Hungary 3256 offices, with 22,824 kilometres (14,182 miles) of line, and 114,741 kilometres (71,293 miles) of wire.

HISTORY.

The Austrian Parliament.—The lower house of the Reichsrath, which was elected in December, 1900, and January, 1901, comprises more than twenty separate parties or political groups; these, however, in a general way, are divided into the Right and the Left. The principal elements composing the Right are the Poles, who are conservative and Catholic; the Clericals, who though of German blood prefer, on account of their conservatism, to stand with the Poles; and the Czechs of Bohemia, who, though liberal rather than conservative, make of greatest importance their anti-German propaganda. The Left, which includes most of the Germans, is composed principally of the Liberals, the Radicals, and the Pan-Germans.

It will be remembered that in 1901, after four years of parliamentary obstruction, the premier, Dr. von Koerber, succeeded in getting the Reichsrath to adopt his economic bill providing for railways and canals. Disputes, however, upon the race and language question were resumed in all their bitterness in the autumn session of 1901, and continued in the following session, which began on February 4, 1902. Early in the year Dr. von Koerber was forced to hint for the second time at the possible suspension of the constitution unless the dilatory and disorderly tactics of the factions should cease. But the premier did succeed in persuading the Reichsrath to adopt a number of measures, including the budget, the authorization of certain agricultural bodies, and amendments to industrial laws. This success was won from the various factions, each having a national and political programme, only by means of concessions to their financial demands. It appears that these demands, exacted at a time of economic depression, proceeded not so much from actual need as from the sense of equality dominant in each nationality. It may be said that to establish equality among the eight clamorous nationalities existing in Austria, in the courts, the schools, and the various public services, such as railways, posts and telegraphs, it would be necessary to decentralize the administration in many respects, a change that would entail upon the government greatly increased expenditure. With this the government is not prepared to cope; for during the four years when, on account of obstruction, the budget was not voted by the parliament, but was approved by imperial ordinance in virtue of paragraph fourteen of the constitution, the expenses increased by about 250,000,000 kronen, while the revenue did not expand proportionally. The industrial depression, moreover, that has existed for a number of years threatened in 1902 to become still worse from the application of the Brussels sugar convention (proposed to go into effect in September, 1903), so that a real difficulty begins to appear for maintaining the equilibrium of the budget.

By the ever recurring language disputes between Czech and German, the spring

session was frittered away. It is the Czech and German controversy in Austria that attracts greatest attention; but there are other grave racial questions as well. Italian irredentism is discussed daily. The Poles, even when showing fidelity to Austria, which has given them administrative autonomy, are dreaming of a new Poland, united and independent. The Ruthenians are restless. The Roumanians carry on a campaign for effecting a union with their mother country. The Slavs of the south, the Serbs, Slovenes, and Croats, look for the solution of the Balkan question in the reconstitution of the disparate Slav states. With these divers and conflicting ambitions dominant, there is small wonder that the members of the Austrian parliament serve Austria so meanly. In one thing the government pleased all parties. It gave its approval to a bill modifying the press law of 1867 by increasing the privileges and the legal protection of authors, publishers, and booksellers. The session adjourned on June 20.

The fall session of the Reichsrath began on October 16, 1902. Before it were many important bills left over from the preceding session. But parliamentary action was destined to be once more stultified by Czech obstruction. Since 1897 this system of political ruffianism has continued practically without interruption, save the four months of conciliation in 1901 and a short period at the beginning of 1902. Its introduction into the Reichsrath came through the repeal of the Badeni ordinance, soon after its promulgation (1897), which granted to the Czechs certain rights in regard to language. For such rights the Czech members have been fighting, by nullifying other parliamentary business ever since, with the result that administrative activity and authority, public finance, the wonted prestige of justice, and the dignity, to say nothing of the efficiency, of parliament, are despaired of at home and ridiculed abroad. In general, measures are adopted, if at all, by unworthy concessions or unscrupulous political bargaining; and this probably applies even to the economic bill passed in 1901 and the budget voted in 1902. In the latter year the government, firmly believing that the language question could be settled only by legislative enactment, would not, as in the Badeni case, issue an ordinance on the subject at the demand of the Czechs. On October 14, 1902, two days before the opening of the parliament, Dr. von Koerber called together the representatives of the two factions and submitted for their consideration a measure constituting the basis of a settlement for the official use of Czech and of German in Bohemia and Moravia. It was proposed to divide Bohemia into three zones, German being the official language in the first, Czech in the second, and the two languages in the third. Under this system, many details of administration were proposed. As might have been foreseen, the plan failed to please either the Germans or the Czechs. Although the former demanded simply modifications of the project, the Czechs refused even to give it serious consideration, for they held that it was in contradiction to the traditions and rights of the kingdom of Bohemia, which could not approve the official establishment of any language except Czech, even in its German districts. Neither was any agreement reached in regard to Moravia. Upon the opening of the parliament, the premier again attempted to pave the way for a legislative solution of the difficulty. "Any ordinance," he said, "is a sheet of paper; a law is a table of bronze. An ordinance expresses the wish of an unstable ministry; a law is the will of the empire. Law is a guaranty of peace." The Germans then submitted a plan for the settlement of the question in Bohemia, where about 37 per cent. of the population is German. These proposals were even more radical than those of the premier, and, like his and on the same grounds, were wholly rejected by the Czechs. So it was that from the opening to the closure of the session, on December 18, 1902, the usual obstructionist tactics held full sway, notwithstanding the urgent need of harmony, in view of the *Ausgleich* negotiations then going on. Only two measures were enacted. The one prohibited dealing in futures in grain on Exchange, providing for its violation penalties of heavy fines and imprisonment; the other, inspired by a reactionary spirit of protectionism, forbade peddling.

At the end of the year, when the parties were thoroughly at variance and the general situation was most disconcerting, the premier was obliged to authorize the raising of revenue for the first six months of 1903 by imperial ordinance.

Hungary.—Few measures of wide significance or importance were enacted by the parliament in the sessions of 1902. Indeed, the main interests of that year lay in the menacing growth of racial feeling in the kingdom, the increasing sentiment for a separation from Austria save in the person of a common sovereign, and the negotiations on the *Ausgleich*, which involved a far-reaching consideration of Hungary's economic condition. In the fall of 1902 it appeared that the race question was becoming in no small measure a disturbing factor to the government, and both M. de Szell, the premier, and Count Albert Apponyi, the president of the lower house of parliament, had fears of a recrudescence of race bitterness. The Magyars constitute a little over half the population, the remainder being for the most part Slav and Roumanian, chiefly the former. Probably much of the unrest in Hungary

is due to the pan-German propaganda, for though Germans constitute only a small part of the inhabitants, it is felt that they have behind them not only a large German element in Austria but even the German empire itself. It is this feeling doubtless that has served to turn away to a noticeable degree Magyar favor from the Triple Alliance. Behind the Slavs is the ever suspected power of Russia, and it is likely that even the Roumanian interests have some support, moral at least, from abroad. Thus the Magyars stand alone, and, as though trouble at home were not enough, they are constantly at odds with Austria. This was particularly evident in 1902 in respect to army administration, and, aside from the *Ausgleich* dispute, culminated in the popular resentment against Minister von Krieghammer's army bill.

On March 4, 1902, M. Hegedues, the minister of commerce, resigned and was succeeded by M. Horansky; the latter died on April 9, and was succeeded on the 30th by M. Lang. On September 19, 1902, the hundredth anniversary of the birth of Louis Kossuth was celebrated with great popular demonstration and elaborate ceremony.

The Ausgleich.—During 1902 the most prominent feature in the affairs of the monarchy as a whole was the negotiations between the premier of Austria, Dr. Ernst von Koerber, and the premier of Hungary, M. Koloman de Szell, looking toward the renewal of the economic and customs union, popularly known as the *Ausgleich*. This term properly signifies the constitutional compromise of 1867, which forms the basis of the dual monarchy, and as such includes the arrangements relating to the dynasty, army and navy, and foreign affairs—arrangements that under the existing constitutions are unalterable. The *Ausgleich* also contained an agreement concerning the financial and commercial relations subsisting between Austria and Hungary, and this was subject to revision every ten years. It is this financial and commercial compromise, or customs union, that has been the subject of controversy since 1897. The compromise failed of renewal in that year, and in 1899 was formally dissolved. As a substitute for the customs union a reciprocity treaty was ratified by the Hungarian parliament in June, 1899, and in Austria by the imperial ordinance of September 21, 1899. This arrangement did not fix the exact date at which a definitive customs union should be established. The imperial ordinance, however, provided that conferences for effecting such a union should be begun in 1901, and that the customs tariff should be replaced by a new tariff before the beginning of negotiations with foreign powers for the conclusion of treaties of commerce. From the latter provision it appeared that the existing customs arrangement should be brought to an end before January 1, 1903, since at that time the treaties of commerce with Germany and several other states could be denounced. Finally, the imperial ordinance of 1899 provided that if by the end of 1903 a definitive customs and commercial union had not been concluded between Austria and Hungary, the existing economic union should continue only to 1907. The Hungarian parliament voted also that if by 1903 such a customs union had not been agreed upon, these treaties of commerce should not be prolonged after 1907. The Hungarian parliament also demanded that the definitive customs union should be ratified in Austria by parliament and not, as was the provisional union, by imperial ordinance. Without the approval of the Reichsrath, Hungary would not agree to the conclusion with foreign states of treaties of commerce binding both parts of the monarchy. The purpose of this measure, which has received the name of its author, Szell, is to reserve to Hungary the right of fixing its economic relations with other states in case of continued obstruction in the Reichsrath.

Discussions of the customs union by the two premiers, begun in 1901 in accordance with the agreement of 1899, continued through 1902. In May of the latter year serious difficulties presented themselves. On June 24 the Austrian government notified Hungary of its intention to denounce the treaties of commerce with foreign nations at the end of 1902. In order to carry out this measure it was necessary that some economic *modus vivendi* be established between the two parts of the monarchy, and to this end what amounted to a practical intervention on the part of the emperor-king, Franz Josef, in the negotiations between the dissident premiers took place on June 30. The understanding reached at that time was only general and tentative, and it was recognized that the further negotiations necessary would prove long and laborious, though the great danger—a separate customs system for each half of the monarchy—disappeared, at least for the time being. In October it was reported that the negotiations had been broken off, but they were renewed and continued throughout the month of December. On the evening of December 31, 1902, an agreement was reached at Vienna by Dr. von Koerber and M. de Szell with regard to the customs union, which up to the last moment had remained in doubt. It appeared that the premiers came to this agreement only through mutual concessions, due largely to pressure brought upon them by the personal interference of Franz Josef and the heir-presumptive, the Archduke Franz Ferdinand. In some quarters it was stated that the aged sovereign threatened to abdicate were the agreement not

arrived at before the end of 1902; however this may have been, it is certain that his personality, which during a reign of more than half a century had showed itself master in many a crisis, was the moving force that brought the two premiers together. It remained for the parliaments of Austria and Hungary to ratify the arrangement thus concluded, and at the end of the year promise of such ratification was none too good.

In their negotiations the crux of the difficulty before the two premiers, both of whom strove faithfully to support the interests of their respective constituents, had been the abiding conflict between industrial and agrarian peoples on the subject of the tariff. In the case of Austria and Hungary this conflict was augmented by a mutual indisposition to accept any equitable concessions. Austria is becoming more and more an industrial country, while Hungary is distinctively agricultural. The demand of Hungary for high tariffs on cereals, wool, hemp, flax, jute, and other agricultural products was hotly contested by Austria, since such tariffs on raw materials would threaten the very existence of Austrian industry; on the other hand Hungary refused to increase the protective tariffs demanded by Austria on various manufactured products. In despair Austria pointed out that the existing tariffs on cereals and cattle had almost shut against her the Russian markets, as well as important trade outlets that she had won for herself in Roumania and the Balkan states; and even in Hungary, Austrian trade was on an unfavorable basis, since the Hungarians had established differential freight rates favoring their own goods. Both premiers were strengthened in their positions by parliamentary warnings against any sacrifices, and when, as was natural in these circumstances, conference after conference during 1902 was barren of result, a popular desire developed for economic separation, "divorce" becoming the rallying cry of the radical parties in both countries. But such a separation is more easily advised than adopted. Nevertheless, it is safe to say that if the Szell-von Koerber agreement, which was finally reached on December 31, 1902 (though its provisions are not yet available), is not of a decidedly agrarian character, that agreement will not receive the sanction of the Hungarian parliament, while in any case it can be ratified in Austria only through concessions to the various nationalities, involving great and unnecessary expense to the government.

The Minister of War.—In the fall sessions of the Austrian and Hungarian parliaments, the minister of war, General Baron Edmund von Krieghammer, introduced bills for the reform of the artillery, including the purchase of new guns and the complete reorganization of the field and mountain artillery. Immediately the plan met with much public opposition, and partly on this account and partly on account of his age and consequent desire to be relieved of the burdens of office he resigned, December 18. It then became known that the government proposed to increase the annual contingent of recruits from 103,000 to 125,000 for the infantry and to 140,000 for the Landwehr in 1903. The bills were in the hands of parliamentary commissions at the end of 1902. General von Krieghammer, who was seventy years old, had passed fifty-three years in active military work, the last nine as minister of war. In Hungary he was said to be unpopular, by reason of his appointment of Austrian officers to Hungarian regiments. Late in December, 1902, he was succeeded, through appointment of Franz Josef, by Lieutenant-General von Pitreich.

Pan-Germanism.—However fanciful it may seem, the popular movement for a greater Germany continues. The idea of a union with the German empire of all the German-speaking peoples of Europe, and, through the exigencies of geographical position, of some other nationalities has become in Austria an important political factor, and has even made itself felt in Hungary, where in 1902 it provoked not a little Magyar indignation. The voice of pan-Germanism is heard not only in the Austrian press but in the Reichsrath, where on March 18, 1902, Herr Schoenerer, leader of the Pan-German party, concluded a speech with, "Long live the Hohenzollerns!" But the more prudent supporters of the movement, which had its preliminary activity at Sedan and Versailles, exercise their influence less noisily and more effectively by means of international societies. The Pan-German League, founded in 1894, had in the following year 7700 adherents; in 1902 it had in Germany about 200 centres of propaganda, 20,000 active members, and in both Germany and Austria an unknown number of adherents. Its central doctrine is, "Germany is coextensive with the territory in which the German language is spoken"; that is, the amalgamation with the German empire of all Austria west of Moravia and even the Teutonic cantons of Switzerland. Such a state would include over 70,000,000 inhabitants—62,000,000 of German race and speech, 6,000,000 Czechs, and perhaps 2,000,000 of Latin or mixed Slavonic stock. The large non-German element is recognized as a serious impediment to the movement, but an impediment that its supporters deem it worth while to overcome for gaining the political and commercial power that would accrue to a state extending from the North Sea and the Baltic to the Adriatic

and the navigable Danube. Interest in pan-Germanism is augmented by the commercial promise in the projected railways and canals in Austria, as well as by the German railway programme in Asia Minor. It is not believed that the pan-Germanists will seek to realize their dreams before the death of Franz Josef, but when the time for action comes the pan-Germanists will encounter a vigorous opposition. There will undoubtedly be opposition on the part of the German-speaking supporters of the House of Hapsburg and among the Czechs of Bohemia, and it has been pointed out that the very antagonism of these races, the one fearing Slavic absorption and the other German, will lead them to stand together for the integrity of Austria. As a more hopeful solution of the internal affairs of Austria, some have urged the principle of federalism, which is favored by probably half of the Austrian Germans. Against pan-Germanism will probably be arrayed the whole diplomacy of Europe. Naturally France would object to German expansion, and Russia would not allow without strong protest a German advance toward the near East, on which she has expended so large an amount of covetous energy—an advance, moreover, that would encompass large Slavic populations—while Italy would not sit idly by and see "Italia Irredenta" pass hopelessly from her influence. Great Britain, furthermore, in view of the importance of her traffic in the Mediterranean and of the "route to India," could ill afford to witness passively the aggressive ascendancy of the German in those waters.

The "Los von Rom" movement, which by attempting to win over to Protestantism the adherents of the state church, is regarded as a phase of the pan-German movement, continued to gain ground in 1902. As a counter agent a large contingent in the Austrian church raised in that year the cry "Away from the Middle Ages," the idea being to reform the church from within by the substitution of evangelical methods for the dominant Ultramontane influences.

The Heir Presumptive.—The Archduke Franz Ferdinand, nephew of Franz Josef and heir presumptive to the thrones of Austria and Hungary, has been conspicuously unfortunate in aggravating the bitter class feeling in the monarchy. In 1902 he continued an active opposition to the "Los von Rom" movement, which he characterized as anti-patriotic and anti-dynastic. His clerical spirit was further attested in the spring of that year by his failure, when traveling in Italy, to visit the royal family, through fear of displeasing the Pope. And he affronted the German factions in Austria, as well as the Magyars, by choosing a Czech noble as companion at the coronation of Edward VII. An event that may involve far-reaching consequences bearing upon the dynasty of Austria-Hungary was the birth of a son and heir, Maximilian Karl, to the Princess Hohenberg (Sophie, Countess of Chotkowa and Wognin), themorganatic consort of the archduke, on September 30, 1902. It will be remembered that upon her marriage (July 21, 1900) the countess renounced for herself and heirs all rights of succession. But it has been pointed out that at any time the Pope can absolve her from the oath of renunciation. For such absolution she is doubtless striving, and to this end is supported by many Czechs and German clericals. Hungary, moreover, does not admit the validity of the oath in respect to that kingdom. In February, 1902, Franz Ferdinand made a visit to the Czar at St. Petersburg.

Foreign Relations.—For years it has been thought that the disruption of the dual monarchy might follow the death of Franz Josef, and it has been felt that the absorption of the country, particularly Austria, by foreign states would be facilitated through its diverse ethnic elements. To promote harmony within the monarchy, as the best safeguard against eventual dismemberment, has been the main endeavor of the sovereign. With direct bearing on its foreign relations, the monarchy has the problems of pan-Germanism and pan-Slavism and of its ambitions in the Balkan states and along the Adriatic, involving not only the adverse interest of Turkey but doubtless of Russia and Italy as well. The actual relations, however, of Austria-Hungary with foreign powers, on the surface, at least, have continued friendly. In this connection the most prominent event of 1902 was the renewal (June 28) of the Triple Alliance. Although in some respects, especially in Balkan matters, the aspirations of Austria-Hungary and Russia seem permanently in conflict, the friendly relations of the two powers, strengthened by the agreement of 1897, were further improved by a *rapprochement* in 1902. Addressing the Delegations convened at Budapest, on May 7, Franz Josef said: "Our continued friendly agreement with the Russian empire concerning events in the near East is particularly calculated to fortify peace and order in those countries." At the same time the minister for foreign affairs, Count Goluchowski, gave assurances that Austria-Hungary and Russia stood for the maintenance of the *status quo* in the Balkans. The minister also stated that the agreement of 1897 and the *rapprochement* of 1902 were purely verbal; the former, he added, consists of a mutual exchange of views calculated to effect a more easy understanding between the two powers in each case that may arise. Count Goluchowski referred to the *rapprochement* (1901) between France and

Italy, and the alliance (1902) between Great Britain and Japan, as being in the interests of the world's peace. In December, 1902, Count Lamsdorff, Russian minister for foreign affairs, visited the Balkan states, and on the 29th of the month arrived at Vienna. His seeming purpose, aside from gaining a more intimate knowledge of Balkan affairs, was to formulate an Austro-Russian note to the Porte, reiterating the demand for reforms in Macedonia, where conditions had become intolerable. A report which in some quarters received little credence became current in the summer of 1902, that Count von Bulow, the German chancellor, had come to an understanding with Count Goluchowski, whereby the former would discourage in Germany the pan-German movement, and the latter would endeavor to prevent the Poles of Galicia from rendering assistance to the Poles of Prussia. It must be remembered, however, that the pan-German movement had its beginning at Berlin, and probably has the approval of a large and influential element in Germany, while in Austria racial antagonism is already so keen that the government could hardly afford to aggravate it further. Whether the understanding between the two ministers was true or not, one thing becomes more certain, and that is that German and Austrian interests, notwithstanding the Triple Alliance, are growing more and more difficult to reconcile. On December 30, 1902, the Austro-Hungarian ambassador at Rome officially denounced the commercial treaty with Italy, which will cease to be in force at the end of 1903. In 1902 the Austro-Hungarian and American legations at Washington and Vienna, respectively, were raised to the rank of embassies. The King of Roumania visited Franz Josef at Vienna in August, 1902. See INTERNATIONAL RELATIONS.

Strikes.—In February, 1902, a strike, apparently fomented to some extent by anarchists, took place among the Lloyd stokers at Trieste, resulting in a general suspension of business. On the 14th and 15th of the month serious riots occurred, during which about a dozen persons were killed and nearly 100 injured. On the 16th martial law was proclaimed in the city.

At the beginning of the harvest in July, 1902, a strike broke out among the agricultural laborers of eastern Galicia (in the Lemberg region), which soon involved about 200 villages and 100,000 laborers. The strikers were Ruthenians—who constitute the larger part of the population, most of the remainder being Poles—and their discontent appeared to be due to unfavorable economic conditions and especially to nationalistic enthusiasm and prejudice. In general the landowners are Poles, between whom and the Ruthenian laborers there has long been serious friction. Upon the importation of laborers and reaping machines from Russian Poland, the strike subsided and ended on August 10. It appears that the Polish landlords, who were doubtless pressed by low prices, had reduced wages to an almost intolerable extent. An uprising of the Ruthenian peasants would embarrass the Vienna government, since they, it is held, are far more loyal to the House of Hapsburg than are the Polish aristocracy. The unrest in Galicia was one of the indications of the increasingly important problem of land tenure in central and eastern Europe—a problem to which the ignorant peasants of Kharkoff and Poltava attempted so violent a solution in the spring of 1902.

AUTOMOBILING, in 1902, continued to attract a great deal of attention from the public, due quite as much to the number of fatal accidents as to any other feature. On account of the propensity of chauffeurs to drive machines along public highways at a dangerous rate, in violation of speed ordinances and in disregard of other vehicles and pedestrians, it became necessary for legislative bodies to fix heavy penalties for offenders. One public good due to the sport, however, is the marked impetus given to the cause of good roads. During 1902 the contests took the form of "reliability runs" and "endurance tests" at long distances over average roads, to a greater extent than in previous years, and became as distinct a feature of competition as track racing. In the run from New York to Boston and return, in October, seventy-five machines of all types started, of which all but seven finished in good condition, those of American manufacture showing the best results. Some of the more notable performances in 1902, with various styles of car, at one mile straight-away, were: P. Owen, 1 minute 17.3-5 seconds, gasoline, 1000 to 2000 pounds, Staten Island; G. C. Cannon, 1 minute 5½ seconds, steam carriage, Providence, R. I. (world's record); M. Augieres, 46 seconds, gasoline, over 2000 pounds, Dourdan, France (world's record). At one kilometre (.621 of a mile), M. Augieres, 29 seconds, gasoline, over 2000 pounds, Dourdan, France (world's record); P. Owen, 47 seconds, gasoline, 1000 to 2000 pounds, Staten Island; L. S. Thompson, 59 seconds, gasoline, under 1000 pounds, Staten Island; C. H. Metz, 43.3-5 seconds, gasoline motor cycle, Staten Island; S. T. Davis, Jr., 46.1-5 seconds, steam carriage, Staten Island; W. C. Baker, 36.1-5 seconds, electric carriage, Staten Island (world's record). At one mile on a circular track: B. Oldfield, 1 minute 11.5 seconds, gasoline, over 2000 pounds, Detroit; P. Owen, 1 minute 19½ seconds, gasoline, 1000 to 2000 pounds, Providence, R. I.; J. F. Duryea, 1 minute 36¾ seconds, gasoline,

under 1000 pounds, Providence, R. I.; G. C. Cannon, 1 minute $7\frac{3}{4}$ seconds, steam carriage, Brighton Beach, N. Y. Abroad, the most important of the long-distance races, from Paris to Vienna (825 miles) was won by M. Renault in 15 hours 22 minutes.

AYRES, ALFRED, the pseudonym of Thomas Embley Osmun (*q. v.*).

AZORES, a group of islands in the north Atlantic, forming administratively an integral part of Portugal, have an estimated area of 1005 square miles. The population, according to the provisional returns of the census of December 1, 1900, was 316,615.

BAALBEK. See **ARCHÆOLOGY** (paragraphs on Syria and Palestine).

BABCOCK, JOSEPH WEEKS, congressman from Wisconsin and chairman of the national Republican congressional committee, has drawn the public attention to himself by his advocacy of a reduction of the tariff on articles that enter largely into American exports, or that are controlled in the domestic market by trusts or combinations of capital. He was born at Swanton, Vt., March 6, 1850, and was taken by his parents to Iowa when five years old. He received an academic education at Cedar Falls, Ia., and in 1881 removed to Necedah, Wis., where he engaged extensively in the lumber industry. He was elected to the Wisconsin State assembly as a Republican in 1888 and 1890, and was elected a member of the Fifty-third Congress from the third Wisconsin district in the fall of 1892. Since that time he has served continuously in Congress, and since 1895 as chairman of the committee on the District of Columbia, a position of great importance, the holder of which is possessed of peculiar powers in the government of the District. In 1895 he was also made chairman of the national Republican congressional committee, and has managed five successive congressional campaigns with conspicuous success. After the retirement of David B. Henderson as speaker was announced, in September, 1902, Congressman Babcock was looked upon as one of the strongest candidates for his place, but withdrew in favor of Joseph G. Cannon.

BABYLONIA. See **ARCHÆOLOGY** (paragraph Babylonia and the East).

BACH, LEONHARD EMIL, German pianist and composer, died February 15, 1902. He was born in Posen, Prussia, March 11, 1849, studied music under Liszt and Kullak, and became a teacher in the latter's Berlin academy in 1869. In 1874 he was made court pianist to Prince George of Prussia and later to the German emperor, and was raised to the Legion of Honor. Besides many pianoforte compositions he composed the short operas *Irmengarda* (1892), *The Lady of Longford* (1894), and *Des Königs Garde* (1895).

BACTERIA. Several new microorganisms were discovered during 1902, and many investigations are under way. The bacillus of the summer diarrhoea of infants has been isolated by C. W. Duval and B. H. Bassett, students working under the direction of Prof. W. H. Welch, of Johns Hopkins University. This bacillus is similar to if not identical with the bacillus of dysentery discovered by Shiga, but its identity is still *sub judice*. J. Ferran, a Spaniard, has reported the discovery of a bacillus in the sputum of tuberculous patients which he believes to produce pre-tubercular lesions and has therefore named the phthisogenic bacillus. After growing for a time in the tissues this bacillus becomes converted into the bacillus tuberculosis. On the other hand, it has been found to be identical with the bacillus coli communis, as isolated from the intestine of the dog. The discovery is received with some reservation. Ghon, Pfeiffer, and Sederl have studied the micrococcus catarrhalis. This organism is not found constantly in affections of the respiratory passages, but has been detected in a certain number of cases of influenza, and particularly in bronchitis and broncho-pneumonia. Bacteria in relation to money have been the subject of investigations carried out at the Hospital du Bey, Algiers, and it was found that almost all varieties of bacteria occur upon currency. Metal, however, has an inimical influence upon them, gold having less than other metals. Typhoid bacilli lived from five to seven days on a gold piece, and less than eighteen hours on other metals. Scotch banks, unlike the Bank of England, reissue old banknotes again and again, regardless of the uncleanness of the practice. On one note 30,000 microbes have been counted in the space that a sixpence would cover. See **ANTITOXIN**, **TUBERCULOSIS**, and **VITAL STATISTICS**.

BAER, GEORGE FREDERICK, president of the Philadelphia and Reading Railroad, came into prominence during 1902 as the leader of the operators in the great anthracite coal strike. Mr. Baer was born in Somerset County, Penn., September 26, 1842, and was educated at Franklin and Marshall College. In 1861 he and his brother acquired the Somerset *Democrat*, which he edited for a year, meanwhile studying law. He served in the Civil War from 1862 to 1863, but left the army after the battle of Chancellorsville and was admitted to the bar in 1864. His practice brought him into connection with railroads, and he has been for many years

the confidential legal adviser of J. Pierpont Morgan in Pennsylvania. Thus in 1901 he was elected president of the Philadelphia and Reading Railroad, in the reorganization of which he had been prominent in 1893, and of the Central Railroad Company of New Jersey. The former road, as chief owner of the Philadelphia and Reading Coal and Iron Company, had the largest interest in the coal mines of the anthracite region, for which reason, after the rejection of the demands formulated by the Shamokin convention on March 18, Mr. Baer was chosen spokesman for the various operators. For his conduct in this position he was harshly censured on account of his statement that there was "nothing to arbitrate" and his refusal to recognize the United Mine Workers of America, declaring that the operators would treat with their employees only as individuals. The result was that the strike lasted from May 12 to October 21, threatening to cause great suffering in the large cities not only by the prohibitive price of coal but by its actual scarcity. After numerous formal and informal protests by politicians and others and the interference of President Roosevelt, the operators consented to the appointment by the President of an investigating commission. See STRIKES (paragraph Anthracite Coal Strike).

BAGDAD RAILWAY. See TURKEY (paragraph Bagdad Railway).

BAHAMAS, a chain of 20 inhabited and many uninhabited islands in the Atlantic Ocean off the southeastern coast of Florida, constitute a British colony. Their area aggregates 5450 square miles, and the population in 1901 was 53,735, of whom four-fifths are negroes. Nassau, on New Providence Island, is the capital. The administration is in the hands of a governor, Sir Gilbert Thomas Carter, since 1897, assisted by executive and legislative councils, and an elected representative assembly. The revenue, accruing largely from customs, amounted in 1901 to £77,780, and the expenditure £81,135. The public debt at the end of that year amounted to £111,626. The imports in 1901 amounted to £324,720, and the exports, the value of which is increasing annually, to £176,884. The chief articles of export are sponges, valued at £100,118 in 1901; fruits, principally pineapples, sent mostly to the United States and valued in 1900 at £59,191; and sisal fibre, plantations of which covered 22,341 acres in 1901. Mahogany, logwood, ebony, and other woods, and tobacco, castor-oil plants and cotton are also produced, and the canning industry is of growing importance. The variety of its resources has kept the colony from falling into the poor industrial condition prevailing in the more southerly sugar-producing islands.

BAILEY, PHILIP JAMES, the author of *Festus*, died September 6, 1902, at Nottingham, England. Born at Nottingham, April 22, 1816, he was in residence for two sessions at Glasgow, from 1833 read law, in 1835 was admitted a member of Lincoln's Inn, and in 1840 called to the bar. He never entered professional practice. A versifier from the age of ten, he began in 1836 his monumental *Festus*, which, published in 1839, captivated the world of letters, drew from Tennyson and Browning unstinted praise, and lived through eleven English and thirty American editions. This dramatic epic of seven hundred closely packed pages was in theme and treatment most ambitious. Its twelve divisions expound the inter-relationship of God and man, the benign power of the Deity, immortality, and a philosophy of conduct based on the combination of reason and faith. Its *personæ* range from Festus himself—in career as in name akin to Faustus—to virtues, angels of varied ranks, cherubim, seraphim, Lucifer, and the Trinity. This pageantry is seldom clearly managed; the action shifts from earth to heaven and thence to "anywhere"; and later interpolations, deductions, and additions augmented the incoherency of the original volume. The "jubilee edition" of 1889 has good need of its explanatory preface. Yet the work is spacious, and does not want for such quotable lines as

"We live in deeds, not years; in thoughts, not breaths;
In feelings, not in figures on a dial.
We should count time by heart-throbs. He most lives
Who thinks most, feels the noblest, acts the best."

It was satirized in Aytoun's *Firmilian*, and from the sixties has been little explored except by the special investigator. It remained, however, the isolated achievement of its author, whose *Angel World* (1850), *Universal Hymn* (1867), and other subsequent efforts are commonplaces which tend only to oppress the earlier poem.

BALDWIN, STEPHEN LIVINGSTON, an American missionary, died in Brooklyn, N. Y., July 28, 1902. He was born in Somerville, N. J., in 1835, and when a young man went to China as a missionary in the service of the Methodist Episcopal Church. His labors in the missionary field extended over a period of more than twenty years and were marked by valuable achievements in educational and religious work. The first movable metal type in China was introduced by him, and he rendered valuable assistance in the translation of the Bible into the Fu-Chan dialect. After returning

to the United States he held pastorates in Newark, N. J.; Nyack, N.Y., and Brooklyn, and was a prominent figure in the Ecumenical Conference that assembled in New York in 1900. In 1888 he became recording secretary of the Missionary Society of the Methodist Episcopal Church, and held that office until his death. His literary efforts included many lectures on Eastern questions and customs, and a volume entitled *Foreign Missions of the Protestant Churches*.

BALFOUR, Rt. Hon. ARTHUR JAMES, who became premier of Great Britain in July, 1902, was born in Scotland, July 25, 1848. He was educated at Eton and at Trinity College, Cambridge, and was elected to the House of Commons as a Conservative in 1874. In Parliament he at first attracted little attention, except as a member of Lord Randolph Churchill's "Fourth Party" of dissident Tories; but he had valuable political experience as private secretary to his uncle, Lord Salisbury, with whom he went to the Berlin Congress of 1878. His publication of *A Defence of Philosophic Doubt* in 1879 gained him a reputation for literary and argumentative ability, but it was not until a crisis in the Irish question that his real character and parliamentary importance were discovered. Previous to his appointment as chief secretary for Ireland in 1887 he had been president of the Local Government Board and secretary for Scotland, but the state of Ireland in 1887 called for exceptional qualities, both to control the agrarian agitation in that island and to repel the attacks of Irish Nationalist members in the House. Mr. Balfour, by his remarkable display of energy and self-control, made futile the onslaughts of the Nationalists, and firmly enforced the laws in Ireland. But although an opponent of Mr. Gladstone's Home-Rule Bill, he was instrumental in passing measures to remedy the Irish agricultural distress. His legislation provided for drainage, light, railways, and a plan of land purchase. In 1891 he was chosen Conservative leader in the House of Commons. After the defeat of home rule and the overthrow of Lord Rosebery's government in 1895, he resumed the leadership of the Commons, his office being that of first lord of the treasury. In the administration his relations with the Liberal-Unionist members, especially Mr. Chamberlain, have been cordial. The resignation of Lord Salisbury on July 11, 1902, was followed immediately by the selection of Mr. Balfour for the premiership. The new premier has thus far filled his office with ability, though he was chiefly responsible for the British alliance with Germany in the attempt to discipline Venezuela, a union that was highly unpopular in England. In 1895 he published *The Foundations of Belief*. Personally he is one of the most popular of living British statesmen.

BALIZE. See BRITISH HONDURAS.

BALKAN PENINSULA is that part of southeastern Europe which lies between the Black and Ægean seas on the east and the Adriatic and Ionian on the west. Roumania, though not geographically a part of the peninsula, is usually regarded as one of the "Balkan states."

As a general thing, local outbreaks and rumors of more widespread uprisings appear each spring in the Balkans. This was true in 1902, but the outbreaks and rumors persisted during the year, so that at its close the chronic unrest was more disconcerting than at any time in a number of years. Although there is no doubt of Russia's ambition to extend her dominion southward, she arrived at an agreement with Austria-Hungary in the spring of 1902, in which both governments expressed their desire for the maintenance of the Balkan *status quo*. But Count Goluchowski, the Austro-Hungarian minister for foreign affairs, addressing the delegations in May, said this *status quo* could not be considered a final solution of the problem. He stated that Turkey had been warned that in the Near East "cruelty and indiscriminate violence could only make things worse," and, he added, the "permanent agitation" there might finally call forth in protest the "combined strength" of Austria-Hungary and Russia. Although Turkish outrages in Macedonia increased rather than diminished as the year advanced, it appeared that by the end of 1902 the Sultan realized that in his accustomed connivance at Mussulman outrages he could no longer play off against each other Russia and Austria-Hungary. This view was emphasized when, late in December, Count Lamsdorff, the Russian minister for foreign affairs, visited Belgrade, Sofia, and finally Vienna (December 29) for the purpose of studying the Balkan question and then of drafting with the Austro-Hungarian government a joint note of protest to the Porte. More difficult of solution even than the problem of Ottoman misrule in Macedonia and Albania are questions raised by the deep-seated antipathies existing between the Christian peoples of the Balkans. Servia and Bulgaria are ambitious of expansion, Albania wants autonomy, which in her case would probably mean even greater anarchy than obtains at present, while the people of Macedonia are divided between a desire for Bulgarian annexation and for self-government. Italy, moreover, still hopes for dominion on the eastern coast

of the Adriatic, and Greece looks longingly at Epirus. For the Macedonian Committee and the outbreaks in Macedonia and Albania, see **TURKEY**; see also **BOSNIA AND HERZEGOVINA**; **BULGARIA**; **GREECE**; **MONTENEGRO**; **ROUMANIA**; and **SERVIA**.

BALLOONS. See **AERIAL NAVIGATION**.

BALUCHISTAN, a country on the Arabian Sea between British India and Persia, has an estimated area of 134,000 square miles and a population of about 810,000. The country is under British protection. Independent Baluchistan (population, about 460,000) comprises a tribal confederacy, at the head of which is the Khan of Khelat (Mir Mahmud since 1893), who, however, is amenable to the advice of the British political agent; various other territories are practically administered by British officials; and in the northeast is British Baluchistan, which is directly under British rule. No part of Baluchistan has foreign relations except with the Indian government. The annual revenue of the Khan of Khelat comprises a subsidy of 100,000 rupees, a quit-rent of 34,000 rupees (for territories under British supervision), and 30,000 rupees in lieu of transit tolls on merchandise in the Bolan Pass, all granted by the Indian government; in addition taxation in kind may sometimes reach a value of 500,000 rupees. (The rupee is worth 32.4 cents.) The leading exports include wool, hides, madder, dried fruit, bdellium, and dates. The trade is largely with British India; this commerce, excluding that over the Sind-Pishin Railway, has been estimated, in rupees, as follows: 1900, imports 787,350, and exports 1,455,310; 1901, 660,930 and 1,152,970 respectively. Trade by the British road in the Nushki district increased about ten-fold from 1896 to 1901. In September, 1902, it was announced that Lord George Hamilton, secretary of state for India, had sanctioned the construction of a railway, to cost about 7,000,000 rupees, from Quetta (which has rail connection with the Indian system) to Nushki, 82 miles distant. This western railway extension on the part of the British, small though it is, called forth unfavorable comment in the Russian press. The *Novoe Vremya* (St. Petersburg) insisted that "Russia must reply to the construction of this railway by immediately building lines of her own through Persia."

BANKRUPTCY. Commercial failures for 1902, according to Dun's *Review*, were 11,615 in number with \$117,476,769 of defaulted liabilities. This is a slight increase over 1901, with 11,002 failures, and \$113,092,376 liabilities. In manufacturing there were 2749 failures for \$47,188,889, against 2441 in 1901 for \$44,950,983. Trading failures numbered 8249, with liabilities of \$56,181,480, compared with 7965 for \$52,060,640 in 1901. Other failures numbered 617, for \$14,206,400, against 596 in 1901, for \$16,070,753. Failures of banks and other financial institutions were 67, involving \$31,910,507, compared with 74, with liabilities of \$18,018,774 in 1901. With the growth in volume of business the ratio of bankruptcies to solvent payments through clearing-houses has declined quite steadily since 1896. In 1902 the ratio of defaulted liabilities to the total solvent payments was \$0.99 to \$1000; in 1901 it was \$0.95, and in 1899, \$0.97, these being the only years, since 1873, showing a lower "financial death rate" than 1902. The amount of defaulted liabilities per firm has also declined during the past decade. The proportion of liabilities to the total number of firms doing business was, for 1902, \$94.85; for 1901, \$94.33; for 1900, \$119.63; for 1899, \$78.62. The years 1899 and 1901 again are the only years that show a smaller proportion than is shown by the record of 1902. It would seem from these figures that with the integration of industry, meaning greatly increased capitalization and volume of business for each individual firm, there has been a great improvement in the soundness of business, manifesting itself not only in fewer failures, but, what is more important, in a smaller proportionate total of liabilities. The failures for 1902 were considerably increased because of the short corn and cotton crops of 1901, the decrease in foreign exports, and the unprecedented labor disturbances. These evil effects were, in large part, overcome by the abundant crops of 1902 and the remarkable extension of the domestic demand, holding prices high and keeping business booming. The showing for New England is especially favorable, except for Rhode Island, which shows an increase of liabilities of about 50 per cent. In Pennsylvania naturally the losses were much heavier than the normal, on account of the coal strike—liabilities being about 50 per cent. heavier. Canadian defaults for 1902 numbered 1101, with liabilities of \$10,934,777. The number is smaller than it has been for many years, and the amount is below the average for several years, though slightly above the amount, \$10,811,671, reported for 1901. The classification of commercial failures in 1901 and 1902, according to Dun's *Review*, is given on the two pages following.

National Bankruptcy Law.—The National Bankruptcy Act of July 1, 1898, enacted to provide uniformity in bankruptcy law in all places under the jurisdiction of the United States, provides that any person who owes debts, except a corporation, may become a voluntary bankrupt upon complying with certain conditions, among which is to make a sworn statement of the amount and kinds of property owned by the petitioner. The necessity for a uniform law co-extensive with the country is

obvious, but the looseness of the statute was an incentive for dishonest debtors, by fraudulent returns of property, to avoid paying their obligations. The abuses were so great that in the Fifty-seventh Congress a bill was introduced in the House by Mr. George W. Ray, of New York, amending the law in several points. The more important amendments are briefly as follows: (1) In order to make the law more uniform and equitable where insolvency is the question at issue, assets claimed to be exempt shall not be counted in ascertaining the amount of the debtor's property; (2) payment made by the bankrupt in the ordinary course of business within four months preceding bankruptcy are not classed as preferences, and are not required to be refunded by the creditor before the remaining portion of his debt can be considered, as is the case under the existing law; (3) the bankruptcy law is extended to the three cases: (a) a general assignment, (b) a voluntary accounting of an insolvent partnership by action brought by one of the partners, (c) an application for a receivership of an insolvent corporation. (This will prevent "in-the-family" receiverships and accountings in the last two cases); (4) the application of the law to corporations and companies not before included is extended, and provision is made that no discharge of such corporation or company shall free the officials or stockholders from liability under State laws; (5) the meaning of the law is defined more clearly, and provision is made for four additional grounds for refusal of a discharge in bankruptcy: (a) obtaining property on credit on materially false statements, (b) making a fraudulent transfer of property, (c) having been granted or denied a petition in bankruptcy within six years, and (d) having refused to obey the lawful orders of the court or having refused to answer material questions approved by the court; (6) liabilities for frauds, etc., shall not be discharged by the law; (7) other amendments provide for greater expedition and accuracy in the operation of the law; (8) section twelve provides that the claims of preferred creditors shall not be allowed unless such creditors shall surrender all preferences, conveyances, transfers, assignments, etc., which they may have received. This bill passed the House June 17, 1902, and was referred to the Senate committee on judiciary, from which it was reported early in the second session with some minor amendments. The amended bill quickly passed the Senate.

BANKS--BANKING. *Banking Expansion.*—In an address delivered on October 31, 1902, Hon. Frank A. Vanderlip expressed his apprehension at the large expansion of banking credits within the last few years. It appeared, he said, from reports of the comptroller of the currency that deposits in all national banks aggregated at the beginning of 1899, \$3,226,000,000, while in September, 1902, the deposits aggregated \$4,527,000,000. Against these deposits the banks held in specie or legal tender \$509,000,000 in 1899 and \$508,000,000 in September, 1902. In other words, there had been an expansion of credits amounting to \$1,300,000,000 with no corresponding reserves. Now in the same time he estimated that the deposits of other banks—State banks, trust companies, savings banks, and private banks—had probably increased not far from \$3,000,000,000, and there was little likelihood that their gold and legal tender reserve was materially larger than, if as large as, at the beginning of 1899. There was then in the last four years an increase in the total bank deposits of the country of over \$4,000,000,000, accompanied by no increase in specie and legal tender holdings. In accounting for this dangerous tendency, Mr. Vanderlip believed that it was mainly caused by the formation of great industrial establishments out of smaller ones. For these industrial formations converted stocks of unincorporated properties, which were formerly largely held closely or as fixed investments, into marketable securities, which were then made the basis of loans, and therefore of increased deposits, and which in general entered actively into the system of financial operations. Another contributing influence he found in the large expenditures of corporations, and particularly of railroads, for betterments and extensions. For these improvements new credits were commonly created while the capital representing them was converted into a fixed form of investment yielding comparatively small returns and then often only in future years. By this method much liquid capital was withdrawn, the corporations resting and relying upon the future rather than upon the present. Owing to these and other causes, the national banking reserve fell from 33 per cent. in 1899 to 21 per cent. in September, 1902. In commenting upon this address, the *New York Journal of Commerce* stated on November 6: "On the face of this record the fact stands out very clearly that the last four years have witnessed an inflation in bank credits without any parallel in our history. It is an elementary proposition that the only security which can be provided against the consequences of inflation is to be found in specie redemption for all liabilities. But in the present case, obviously, no such security exists."

Bond Security.—The action of the secretary of the treasury in October, 1902, in ruling that State and city bonds might be accepted by the government in lieu of national bonds as security for public deposits, was thought by many conservative financial journals to constitute an untoward precedent. It was admitted that the

necessity of relieving the monetary stringency had been acute, and that the bonds accepted were unquestionably good; but it was asserted that since the treasury's acceptance, or more properly endorsement of the bonds, aided their general investment standing, there would be the strongest sort of pressure brought to have doubtful public bonds accepted and perhaps to have private securities similarly accepted. "Let once a monetary convulsion be imminent," said the *Journal of Commerce*, "and the precedent once established will be recalled with increasing force, and we may be hurried headlong to a note currency based upon bond security where the bonds have not even the merit of unquestionable soundness, and where the treasury will be charged with the onerous and ungrateful duty of discriminating between different kinds of corporation securities."

Resources of Banks in the United States.—The statistics for banks of all kinds in the States, Territories, and insular possessions of the United States, as compiled by the comptroller of the currency from reports made to him on or about June 30, 1902, show aggregate resources of \$13,363,865,818, a gain over the preceding year of \$1,006,388,442. The population of the United States and its possessions, estimated by the government actuary on June 1, 1902, was 88,003,000, so that the average per capita resources of all its banks was \$151.86, as against \$158.79 in 1901. For the United States proper, the per capita resources of all banks were estimated at \$179.74 in 1901 and \$168.96 in 1902. As between the several classes of banks, the average per capita in 1902 was made up as follows: National, \$76.20; State, \$28.82; loan and trust companies, \$25.16; savings, \$36.70; and private, \$22.08. The largest per capita resources of all banks were in the New England States, where the per capita was \$354.86. The Eastern States followed with a per capita of \$351.37, and then came in order the Pacific States with \$197.58, the Middle States with \$128.72, the Western States with \$89.94, and the Southern States with \$36.88. The Southern States possess, according to the number of inhabitants, less than one-half the banking resources of any other section of the country; hardly one-tenth of those of the New England or Western States, and hardly more than one-fifth of the average banking resources of the country. Savings banks in the New England States possess by far the largest per capita resources, and national banks and loan and trust companies have the largest per capita resources in the Eastern States. Massachusetts leads all the States in the per capita resources of all its banks and its loan and trust companies. From the 4535 national banks and 7889 other banks in the United States and its possessions, according to the comptroller of the currency, it appears that the aggregate resources of all national banks were \$6,008,754,975, and of other banks, \$7,335,110,843. It must be remembered, however, that the returns for national banks are complete in all respects, while the reports of State and private banks are very incomplete, so the relative strength of national banks is really much less than is indicated by the figures given. The loans of all the 12,424 banks reported were \$7,189,109,761; United States bonds were held to the extent of \$523,246,564; other bonds to the amount of \$2,516,179,995; and cash to the extent of \$848,103,605. The capital of these banks was \$1,201,611,762; surplus and profits, \$1,096,887,247; deposits, \$9,228,689,111; and aggregate resources, \$13,363,865,818. Reports received from State banks showed an average dividend payment of 8.9 per cent., and an average rate of 8.97 per cent. payment by loan and trust companies. By sections, the capital stock of all banks reported was: New England States, \$152,812,129; Eastern States, \$429,276,989; Southern States, \$137,977,776; Middle States, \$349,362,905; Western States, \$61,197,065; Pacific States, \$65,492,087; and the insular possessions, \$5,492,811. Loan and trust companies were found only in the New England States, the Eastern States, and the Middle States. The total capital stock of all trust companies was \$179,732,581, of which \$116,022,892 was issued by New York and Pennsylvania companies. Private companies obtained most largely in the Middle States, their capital there aggregating \$15,865,404, as against \$22,963,614 for the United States. With the exception of less than a million dollars, the entire capital stock of savings banks was found in Iowa and California, the capital of such institutions in these States being, respectively, \$10,311,600 and \$7,879,205. In the ten years from 1892 to 1902, the loans of all banks in the United States increased from \$4,337,000,000 to \$7,169,000,000; cash on hand, from \$586,000,000 to \$839,000,000; capital stock from \$1,071,000,000 to \$1,198,000,000; and individual deposits from \$4,665,000,000 to \$9,082,000,000. The table on the following page, compiled from figures published by the comptroller of the currency, shows by States and by divisions of States, the per capita resources of each class of banks and of all banks in the United States and its possessions on or about June 30, 1902, and shows also the total resources of all banks in 1902, and the total resources in millions of dollars of all banks on or about June 30, 1901.

For further details regarding each class of banks in the United States, as compiled by States, see **LOAN AND TRUST COMPANIES**; **NATIONAL BANKS**; **PRIVATE BANKS**; **SAVINGS BANKS**; **STATE BANKS**.

Currency Reform.—The convention of the American Bankers' Association, which met at New Orleans, in November, was addressed by the comptroller of the currency, ex-Comptroller Dawes, C. N. Fowler, author of the Fowler Bill, C. A. Pugsley, and Horace White. They all spoke on the necessity of greater elasticity in the currency system, in order to avoid the spasms in the money market, which recur so regularly and so unpleasantly every autumn when cash is drawn from eastern banks to move the crops of the agricultural west. There was no agreement among the speakers as to a remedy, nor has any measure yet been devised which has met with sufficient approval to insure its passage by Congress, or even its acceptance by a majority of bankers. When the demand for money to move the crops declines, the country banker, being unable to reduce his circulation easily and readily, increases his balance in the reserve cities, especially New York, attracted by the interest he receives. A New York banker can do little with the money except to lend it on call. The plethora of money stimulates stock gambling, unsound promotion, and underwriting of all sorts of new enterprises on the most uncertain basis of these demand deposits from outside banks. Mr. William B. Ridgely, in *Sound Currency* for December, 1902, says: "In the autumn when this money is wanted again, there is trouble to furnish it. This goes on year after year. Every one knows what is going to happen, and it always does happen. The annual recurrence of this perennial disturbance of the money market is a disgrace to our intelligence and a reflection on our business judgment and sense. . . . We have the greatest farms and the best farming machinery for producing the crops, the most extensive, best equipped, and most perfectly organized system of warehouses, elevators, lake vessels and railways, for storing, handling, and distributing these products, and yet year after year we go on using the obsolete financial machinery without even an apparent effort to improve it. It is not so much a question for the banks and bankers nor of furnishing them additional privileges, but it is a matter of paramount importance to the people engaged in all lines of business, who have the right to demand that they be given the best business facilities which can be devised."

The necessity for a more elastic currency was discussed throughout 1902, and much effort was made to arouse an intelligent popular interest in the subject. Almost all the plans for currency reform start with the assumption that to give elasticity to the currency the issuance of bank notes must be made easier. The demands for asset currency, emergency circulation, and other disguised forms of credit money all proceed upon this theory. More money, plenty of it, was the cry, as it was in the "Greenback" and the "Free-silver" days. The general demand has merely shifted from irredeemable paper and depreciated metal to "elastic" bank-note currency. To many it seemed that elasticity means power to expand but not to contract. Even financial writers generally spoke of the needs of more money to move the crops, and passed over in silence the equally urgent need of less money for inflating flimsy financial balloons. The advocates of currency reform proposed to secure elasticity by basing note issues upon bank assets and by taxing emergency note issues. The *Bankers' Magazine* held that contraction can be assumed quite as efficiently and more cheaply by requiring gold redemption. A tax large enough to force the retirement of an emergency circulation, it says, "would be a considerable burden on business by making such notes unnecessarily costly." Such currency would be issued only when interest rates were high and the added tax of five or six per cent. would prevent the use of the notes in any legitimate business. This view was not generally accepted. The tax clearly would not actually be added to the interest rate, but when the interest rate should rise high enough to make it profitable notes would be issued. The point of issuance would be determined by the tax rate, the interest rate being affected only indirectly. In the main, however, the criticism is sound.

The cry for more money was not universal. Many believe that the high prices were caused by a redundant currency. The London *Bankers' Magazine* pointed out the fact that the United States had an amount of currency considerably in excess of the total volume of foreign trade. "As a purely monetary proposition there is no proof whatever that the United States has an insufficient currency. The official statistics indicate quite the reverse. It is inconceivable that over eighty millions of people should have real use for \$2,336,000,000 of circulating medium. Or, if at exceptional seasons of the year, at the moving of the crops, for instance, it should be all needed, these emergencies are brief; they recur annually and can always be anticipated. Moreover, 'elastic' banking is required then, rather than 'elastic' currency. A well-managed bank should always be able to finance the local crops by judicious use of its credit without reference to whether the total currency of the country be a few million dollars more or less." The writer bewails the "magnateered" state of the American people who, "having lost control of their iron, their coal, their beef, and nearly every other staple product of the soil, have still one anchor of individual liberty to hold on to, and that is their local banks." He expresses great satisfaction in the prospective defeat of the branch banking scheme.

In his report, Secretary of the Treasury Shaw favored (1902) a law providing for the exchange of gold for silver, and when this shall have been done he suggests that national bank notes be made redeemable in gold. He thinks that the burden of providing gold for export and for domestic use would thus be transferred, in great part, from the government to the banks. Mr. Shaw failed to notice that the banks could easily shift the burden by presenting legal tenders and silver for redemption in gold. He did not advocate the retirement of the greenbacks. He recommended the repeal of the law limiting the total subsidiary coinage to \$100,000,000, and the conversion of silver dollars and bullion into subsidiary coins whenever required. He did not favor branch banks, but suggested that banks be permitted to issue notes on their general credit, and expressed the opinion that with a proper tax—which he chose to call an insurance premium—the notes so issued would be absolutely safe, even without being made a first lien upon assets.

The Fowler Bills.—The most important provisions of the original bill introduced by Representative C. N. Fowler, of New Jersey, at the first session of the Fifty-seventh Congress were: (I) The establishment of a division of banking and currency in the treasury department to consist of three members exercising all the authority of the present comptroller of the currency and such other authority vested in them by the bill; (II) any national bank that shall assume the current redemption of an amount of United States notes equal to 20 per cent. of its paid-up capital, shall have the right, without depositing United States bonds, (1) to issue an amount of bank notes equal to 10 per cent. of its paid-up capital by paying a semi-annual tax of one-eighth of one per cent. on the average amount of such notes in circulation; (2) to issue an equal amount under like conditions during the first year. The tax was not to be increased so long as the United States notes were redeemed by the bank, but whenever any of the notes should be presented at the United States treasury for final redemption and retirement, the tax on a corresponding amount of the bank's circulation should be increased to five-eighths of one per cent. semi-annually. Further provisions allowed the banks to issue additional notes to an amount equal to 40 per cent. of their paid-up capital by paying a semi-annual tax of five-eighths of one per cent. on the amount issued, 20 per cent. more by paying a semi-annual tax of $1\frac{1}{2}$ per cent., and 20 per cent. more by paying a semi-annual tax of $2\frac{1}{2}$ per cent. Under this bill, if a bank should assume the redemption of United States notes, it must present the same at the treasury for indorsement, and at the same time surrender an additional amount of United States notes equal to one-half of the notes presented for indorsement, receiving therefor gold coin. These additional notes were to be cancelled and destroyed. (III) When the banks should have issued United States notes to the amount of \$130,000,000, and the United States had consequently retired \$65,000,000 of these notes, it was provided that only indorsed United States notes should be paid out by the banks, the unindorsed notes to be surrendered for gold to the treasury to be destroyed. Another section authorized the secretary of the treasury to deposit all money of the United States in excess of \$50,000,000 in national banks, upon condition that the banks deposit United States bonds equal in amount at par. (IV) Section 20 provided for the establishment of branch banks. The principal object of the law was to substitute a safe and elastic bank currency for the "greenbacks," which are perfectly inelastic and form the links of the "endless chain," so effective in depleting the treasury reserve in time of money stringency. The demand obligations of the government amount, all told, to more than \$700,000,000. It was the intention to shoulder this vast burden upon the banks, and to make the banks entirely responsible for providing and protecting the commercial reserve and for furnishing all the gold needed for export. This would simplify and limit the government's fiscal operations to the collection of revenues and the payment of expenses, precisely as the States and municipalities collect and disburse their revenues. The second great object of the measure was to give banking institutions the privilege of establishing themselves anywhere in the United States, its possessions, or other countries, thus lowering and equalizing the rates of interest in all parts of the country, and putting the farmers and merchants of small rural communities on equal terms with the borrowers in the great commercial centres. The bill passed the House but failed of consideration in the Senate. The Senate, and, indeed the country generally, were hardly ready for such a revolutionary measure. Mr. Fowler accordingly remodeled his bill, struck out the more radical features, and introduced what is really a new measure at the beginning of the second session of the Fifty-seventh Congress. This bill provides that a national bank may issue bank notes to the amount of 25 per cent. of its paid-up capital without depositing United States bonds, but shall pay a semi-annual tax of one-quarter of one per cent. on such issue. Much opposition was developed even to this mild reform and its passage seemed doubtful at the close of 1902.

Branch Banking.—Briefly, the proposed branch banking system is a plan to

authorize the national banks to establish branches wherever they wish. The advantages alleged are: (1) Greater resources available in communities distant from financial centres; (2) uniform and lower interest rates throughout the country; (3) far greater power of concentration of capital at the point most in need of it, thus securing the much demanded "elasticity" of currency; (4) economy. The objections urged are: (1) Danger of a banking monopoly, which may exact almost any interest rates, and crush out independent bankers, and (2) insufficient banking facilities for rural districts.

The Canadian system of branch banks has been held up as a model worthy of imitation, because it makes interest rates uniform throughout the country, prevents the sudden flurries at the financial centres when outside demand is heavy, and furnishes a currency of great elasticity. The *Bankers' Magazine* for December, 1902, points out that while the Canadian system prevents the recurrence of money scarcity in the financial centres, it does so at the expense of the agricultural communities, which are very inadequately supplied with money at the harvest season. The Manitoba department of agriculture complained of the lack of banking facilities in moving the enormous wheat crop. At Winnipeg, the commercial centre of the Canadian Northwest, only twelve of the more than thirty chartered banks of the Dominion have established branches, and throughout the whole territory only some forty branches have been established. The *Bankers' Magazine* remarks: "Without ascribing to the Canadian banking managers any design of forcing the wheat at low prices into the hands of bank favorites, and allowing for the imperfect conditions for the collection and transportation of the grain, this instance of inability to care for a phenomenal crop indicates that the business instincts of the population are not stimulated under the chartered and exclusive system of Canada as they are under the independent competition of the free banks of the United States. . . . The more the practical operations of the Canadian chartered bank, through its branches, are looked into closely, it will be found that while perhaps admirable for the concentration of capital and for safety, they may either from design or from inherent imperfection be very defective in the distribution of facilities. . . . The Canadian centres of collection keep themselves free from these spasms, because they are in a position to refuse to strip themselves to meet even the most urgent local needs."

The system of independent banks of the United States supplies cash to the centres of trade more efficiently than does the Canadian system, and at the same time our local banks have the absolute power to demand the return of their deposits whenever the need arises. The defect in the American system is the lack of elasticity in note circulation, and insufficient power to enlarge cash reserves on the part of the great banks of the money centres in time of strong demand for money. The *Bankers' Magazine* concludes that the Canadian plan, while it has many excellent features, cannot be copied with advantage by the United States.

The annual convention of the Wisconsin Bankers' Association unanimously adopted resolutions opposing the "Fowler Bill and all legislation tending to the substitution of branch banks for our present independent system of banking"; also, "any law tending toward the substitution of asset currency for the present national bank circulation." It was urged in opposition to the Fowler Bill that it would "bring about a banking trust, with a \$50,000,000 parent bank at New York with \$500,000,000 in asset currency, the annihilation of every bank in every city of any importance in the United States and the substitution therefor of the branch bank, the abolishment of the United States treasury and the virtual withdrawal of the United States from managing its own affairs." It was also argued that branch banking would reduce interest rates until a monopoly was secured, and then raise the rates higher than before.

Foreign Banks of Issue.—The condition of the principal foreign banks of issue on April 1, 1902, as reported by the *Bulletin de Statistique*, is as follows, in millions of francs (the franc is worth 19.3 cents):

BANKS.	Capital.	Specie Reserves.			Circulation.	Deposits and Accounts Current.	Minimum Rate of Discount.
		Gold.	Silver.	Total Specie.			
Imperial Bank of Germany...	150.0	1,238.7	1,762.1	707.6	Per Cent.
Bank of Austria-Hungary.....	217.0	1,110.4	320.4	1,430.8	1,543.4	126.7	3
National Bank of Belgium.....	50.0	117.4	604.7	63.9	3½
Bank of France	182.5	2,570.2	1,125.0	3,695.0	4,041.0	544.6	3
Bank of Italy	240.0	318.4	66.4	384.8	863.5	176.2	5
Bank of Russia.....	133.4	1,943.5	236.0	2,179.5	1,469.6	436.5	4½
Bank of Spain	150.0	354.1	492.2	846.3	1,598.4	518.3	4
Bank of England.....	367.0	944.4	944.4	759.0	1,108.1	3

BAPTISTS. The American Baptist churches ascribe their origin to Roger Williams, who, about 1640, became converted to the principles of the Baptist faith. There are thirteen divisions of Baptists, but the Regular (North, South, and Colored) Baptists are distinct only in organization, having no doctrinal differences. These three bodies, with a total membership, as reported by the American Baptist *Year Book* of 1902, of 4,269,063, constitute by far the largest part of the denomination, which includes more than 4,625,000 communicants and which ranks third among the denominational families of the United States. The various divisions of Baptists, according to the statistics of Dr. H. K. Carroll, in the *Christian Advocate*, are represented as follows: Regular Baptists (North)—7512 ministers, 8083 churches, and 1,012,276 communicants; Regular Baptists (South)—12,599 ministers, 19,894 churches, and 1,702,324 communicants; Regular Baptists (Colored)—10,726 ministers, 15,583 churches, and 1,615,321 communicants; Six Principle Baptists—8 ministers, 12 churches, and 828 communicants; Seventh Day Baptists—107 ministers, 100 churches, and 10,734 communicants; Free Will Baptists—1360 ministers, 1518 churches, and 84,436 communicants; Original Free Will Baptists—120 ministers, 167 churches, and 12,000 communicants; General Baptists—484 ministers, 423 churches, and 24,775 communicants; Separate Baptists—113 ministers, 103 churches, and 6479 communicants; United Baptists—25 ministers, 204 churches, and 13,209 communicants; Baptist Church of Christ—80 ministers, 152 churches, and 8254 communicants; Primitive Baptists—2130 ministers, 3530 churches, and 126,000 communicants; Old-Two-Seed-in-the-Spirit Predestinarian Baptists—300 ministers, 473 churches, and 12,851 communicants. In the Sunday-schools of the Regular Baptists, 27,211 in number, are enrolled 201,102 officers and teachers and 1,843,469 scholars. The value of church property aggregates nearly \$90,000,000. Educational interests are represented by 9 theological seminaries, 103 universities and colleges, and 91 institutions of lower grade.

The national anniversaries of the various societies of the Northern Baptists in 1902 were held in St. Paul, Minn., May 19-27. The receipts for the year of the American Baptist Missionary Union were \$680,518, the excess of this sum over the appropriations reducing the debt to \$35,000, which is being raised by subscription. The society is desirous of obtaining an increase of \$50,000 in order to send out a number of new missionaries. Its work is carried on in Burma, Assam, Southern India, China, Japan, the Philippines, Africa, and in Europe. One of the features of the meeting was the address of Dr. Thomas S. Barbour, who had returned from an extended tour of the mission fields. A gain of nearly \$24,000, the total being \$694,785, in the sales of the American Baptist Publication Society was reported. This organization also conducts home missionary work, a notable department of which is the maintenance of Gospel wagons (26) and chapel cars (6) in the neglected regions of the West. Announcement was made of a gift of \$40,000 for the missions of the society. The American Baptist Home Missionary Society now supports in the field 1278 missionaries. Its receipts for the year aggregated \$614,223. At the annual meeting were discussed special topics on the various peoples and districts in which the society is interested. The question of coordination or consolidation of the national societies continued to occupy a prominent place in the discussions of 1902, the matter having been agitated for some time. A committee of 15 is to review the whole situation and will make its recommendations at the next anniversaries in Buffalo. The anniversary of the Southern Baptist Convention was held in Asheville, N. C., beginning May 9, 1902. Its foreign mission fields in Italy, Brazil, Mexico, Africa, China, and Japan include 127 churches, 166 out-stations, and 6773 church members; its home department, 2660 churches and stations, in which are employed 811 missionaries. The twenty-second annual meeting of the National Baptist Convention in Birmingham, Ala., about the middle of September, 1902, was the scene of a great disaster, more than a hundred lives, it was reported, being lost in the panic that attended a supposed alarm of fire. The session of the Baptist Congress, held in Boston late in the year, was noticeable chiefly for the argument that unbaptized persons should be admitted to membership in the church, one prominent speaker urging that "baptism is an expression of faith merely, an act of obedience only, and it is essential neither to salvation nor to the highest type of Christian character."

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA, founded in 1891, is an organization of all young people's societies in the Baptist churches of the United States and Canada. Its objects are the promotion of biblical and denominational education and the development of spiritual and missionary activity. The annual convention, held July 10-13, 1902, in Providence, R. I., was noteworthy particularly for the report of the board of managers that the debt of \$20,000 that existed at the time of the last meeting, had been practically cancelled. The union now looks to a substantial expansion of its work, and a general secretary was elected. The convention was attended by over 5400 delegates and visitors, representing forty-five

States and Territories, and provinces, as well as China, Japan, India, Burma, and Africa. The *Baptist Union* is the official publication of the society. President, John H. Chapman; general secretary, Rev. Walter Colley; headquarters, 324 Dearborn Street, Chicago, Ill.

BAR ASSOCIATION, AMERICAN, was organized in 1878 as an association of leading lawyers in the United States, who meet annually for the purpose of discussing matters of interest to the profession and to the community at large. Each State is represented by one vice-president. Membership, about 1750. At the twenty-fifth annual meeting, held at Saratoga Springs, N. Y., August 27-29, 1902, reports on the following and other subjects were presented by committees and discussed: Jurisprudence and law reform, commercial and international law, patent, trade-mark, and copyright law, classification of the law, uniform State laws, federal courts and federal code of criminal procedure, industrial property and international negotiation, title to real estate. The annual address was delivered by Hon. John G. Carlisle. The 1903 meeting is to be held at Hot Springs, Ark. President, Francis Rawle, Philadelphia, Pa.; secretary, John Hinkley, 215 N. Charles Street, Baltimore, Md.

BARBADOS, a West Indian island constituting a British colony, has an area of 166 square miles and a population (1901) of 195,588. The capital is Bridgetown (population, in 1902, about 25,500). Legislation is effected by an appointed council and an elected assembly. The governor in 1902 was Sir Frederic Mitchell Hodgson (since 1900). Revenue and expenditure in 1900 amounted to £185,475 and £182,866 respectively; in 1901, £179,972 and £175,350 respectively. The public debt in 1901 was £428,600. Total imports and exports in 1900 were valued at £1,045,252 and £919,011 respectively; in 1901, £1,021,679 and £950,175. As in other West Indian islands economic conditions in Barbados are retrograde on account of the depression in the cane sugar industry. The sugar question was the principal one discussed at the West Indian Agricultural Conference held in the island January 4-6, 1902. The general opinion was that adequate sugar factories with modern machinery and appliances are absolutely necessary to revive the industry. Owing to the low price of sugar the merchants in the following month refused to advance money for the working of the estates, and upon petition the governor consented to bring before the secretary of state for the colonies the question of an imperial loan. Reduced wages in 1902 increased the general depression, and in the fall of the year a serious epidemic of smallpox aggravated the distress of the black population, who are exceedingly poor.

BARLEY. As reported by the United States Department of Agriculture, the barley crop by countries, in 1901, was as follows:

	Bushels.		Bushels.
Russia.....	239,917,000	Denmark.....	18,000,000
Germany.....	152,537,000	Sweden.....	13,368,000
Austria-Hungary.....	116,315,000	Bulgaria.....	12,000,000
United States.....	109,933,000	Mexico.....	9,000,000
Great Britain and Ireland.....	69,836,000	Italy.....	8,000,000
Spain.....	55,000,000	Belgium.....	4,555,000
Japan.....	44,000,000	Netherlands.....	3,700,000
France.....	38,884,000	Australasia.....	2,868,000
Algeria, Tunis, and Cape Colony.....	43,800,000		
Canada.....	27,581,000	Total.....	995,466,000
Roumania.....	24,222,000		

The imports of barley into the United States in 1902 were 57,406 bushels (valued at \$33,221), of which 56,475 bushels (valued at \$32,730) came from Canada. The amounts in bushels and the values of the exports in 1902 were: Great Britain, 6,377,561, \$2,837,169; Portuguese Africa, 1,034,158, \$447,760; British Australasia, 481,404, \$288,340; Belgium, 606,069, \$271,495; Mexico, 188,823, \$137,863; other countries, 26,253, \$12,676—total, 8,714,268, \$3,995,303.

The *Crop Reporter* for October, 1902, states that "shipments of barley from Pacific ports, in response to rapidly increasing foreign demands, have resulted in such appreciation of the price of this grain as to render its growing in the Pacific Coast States more profitable than that of other cereals." The shipments of barley by sea from California increased from 1,129,416 centals (100 pounds each) in 1892, to 4,381,682 centals in 1902.

Remy, a German plant breeder, who devotes his attention largely to barley, has originated varieties of low-moisture requirements suitable for dry regions. This investigator is endeavoring to move the period during which the barley plant uses the greatest amount of moisture toward the winter so that the growing plant may draw to a greater extent on the supply of winter moisture left in the soil. He found, for example, that a variety called Hanna produced a large total crop and a good yield of grain with a comparatively small moisture supply, and in addition did not prove

very sensitive to a supply of moisture above the normal; while the variety goldthorpe reached its maximum water consumption two weeks earlier, thus being able to use more of the soil moisture stored in the winter. The results of his selection experiments indicate that by selecting plants having a small number of internodes, long upper internodes, and a high percentage of grain the productiveness of the variety can be increased. Fertilizer experiments by the same investigator showed that phosphoric acid and potash increase the yield with a proportional decrease in the protein content of the grain, but that phosphoric acid does not affect the size of the grain. Experiments by Bieler and Aso, of the University of Tokio, showed that barley has a smaller surface capacity for phosphoric acid than either wheat or oats, and that the assimilation of plant food by barley is confined mainly to the earlier stages of growth, while in wheat and oats it is distributed through the period of vegetative activity. Stoklasa and Pietra, in Austria, found that muriate of potash combined in reasonable quantity with superphosphate and nitrate of soda is beneficial to the development of the plant and the quality of the grain. Gross, in Bohemia, found that slow-acting nitrogenous fertilizers, such as barnyard manure, in combination with mineral fertilizers materially increase the yield of barley. Von Seelhorst found that in general a good supply of plant food tends to produce a strong and well-developed root system with roots growing to greater depths than when the food supply is limited. For this reason generously manured barley shows a relatively high resistance to drought.

BARNARD COLLEGE, New York City, organized 1889, a woman's college constituting an integral part of Columbia University (*q.v.*).

BARNWELL, ROBERT WOODWARD, bishop-coadjutor of Alabama, died in Selma, Ala., July 24, 1902. He was born in Beaufort, S. C., December 27, 1849, and was educated at Trinity College, Hartford, Conn. After additional study at the General Theological Seminary, New York, he was ordained in 1875, held a pastorate in Demopolis, Ga., from 1876 to 1880, became rector of St. Paul's Church, Selma, Ala., in 1880, and on May 18, 1900, was elected bishop-coadjutor of the State.

BAR OF THE CITY OF NEW YORK, THE ASSOCIATION OF THE, organized in 1869 and incorporated in 1871, owns and occupies a commodious building at 42 West Forty-fourth Street, New York City, in which is a valuable law library of 53,000 volumes, the property of the association. President (1902-03), William G. Choate; recording secretary, S. B. Brownell; treasurer, S. Sidney Smith.

BARON DE HIRSCH FUND. A fund created in 1889 by Baron Maurice de Hirsch for assisting Jewish, Russian, and Roumanian emigrants to America in getting a start in the new country. The capital invested with this object in view was \$2,500,000, yielding an annual income of \$100,000. An English day school is maintained in the Educational Alliance Building, 193 East Broadway, New York; an evening school at the same address for Russian adults of both sexes who work during the day; a trade school in East Sixty-fourth Street, where young men are taught useful mechanical trades—machine-work, plumbing, carpentry, electrical construction, sign and house-painting, etc. The Jewish Colonization Society co-operates with the directors of the fund. Attendance at the English schools, both day and night, is about 650. President, Meyer S. Isaacs; treasurer, Emanuel Lehman; general agent, A. S. Solomans. Headquarters, 45 Broadway, New York City.

BAROTSELAND, a part of British Central Africa. See RHODESIA (paragraph Northern Rhodesia).

BARROWS, JOHN HENRY, president of Oberlin College, died at Oberlin, O., June 3, 1902. He was born at Medina, Mich., July 11, 1847. After graduating at Olivet College (Mich.) in 1867, he studied at the Yale, Union, and Andover theological seminaries and in Germany, and after holding pastorates at Lawrence and Boston, Mass., occupied the pulpit of the First Congregational Church of Chicago, Ill., from 1881 to 1896. From this church, of which he published a history in 1883, he withdrew to lecture in India, China, and Japan. He was the organizer and president of the World's Congress of Religions at the World's Columbian Exposition of 1893, lectured at the Union Theological Seminary in 1898, and was subsequently lecturer in comparative religion at the University of Chicago. In 1899 he became president of Oberlin. His published volumes include: *The Gospels are True Histories* (1891); *I Believe in God* (1892); and *Henry Ward Beecher, the Pulpit Jupiter* (1893).

BARYTES. See MINERAL PRODUCTION.

BASEBALL. The professional season of 1902 saw the rise of the American League to a position of importance almost equal to that of the National League. This was accomplished by defections from the ranks of the major league's players in favor of its rival, thereby raising the standard of the latter organization. There was constant warfare between the two leagues, which, however, did not diminish the popularity of the game, but rather increased attendance. In cities where both

leagues had teams, the American attracted larger crowds. The results follow. National: Pittsburg, won 103, lost 36; Brooklyn, won 75, lost 63; Boston, won 73, lost 64; Cincinnati, won 70, lost 70; Chicago, won 68, lost 69; St. Louis, won 56, lost 78; Philadelphia, won 56, lost 81; New York, won 48, lost 88. American: Athletics (Philadelphia) won 83, lost 53; St. Louis, won 78, lost 58; Boston, won 77, lost 60; Chicago, won 74, lost 60; Cleveland, won 69, lost 67; Washington, won 61, lost 75; Detroit, won 52, lost 83; Baltimore, won 50, lost 88.

In college baseball there is no championship except by comparison of scores. In 1902 Harvard defeated Yale in their series, the games being (1) Yale 7, Harvard 2; (2) Harvard 10, Yale 4; and (3) Harvard 6, Yale 5. Yale beat Princeton (1) Yale 10, Princeton 6; (2) Princeton 8, Yale 5; and (3) Yale 5, Princeton 4; and Princeton defeated Harvard 7—0, in the only game they played. Of the eastern colleges Harvard was conceded to have had generally the best team. The University of Illinois team traveled east and defeated Princeton 3—1, Yale 10—4, West Point 6—5, and Pennsylvania 11—3, and was in turn beaten by Harvard 2—1. Others of the more important games resulted as follows: Pennsylvania 4, Yale 2; Pennsylvania 4, Cornell 2; Harvard 8, Brown 1; Yale 6, Brown 3; Pennsylvania 7, Brown 1; Harvard 8, Pennsylvania 5; Harvard 1, Pennsylvania 0; Princeton 5, Cornell 1; Princeton 2, Brown 1; Harvard 11, Cornell 1.

The Tri-Collegiate League, composed of Amherst, Wesleyan, and Williams, was dissolved before the championship was decided, on account of difficulties arising in the case of Kane, an Amherst player, against whom charges of professionalism were made. He was declared a professional by the league authorities, but acquitted by the Amherst faculty committee, who insisted on their right to play him in non-league games. Relations with Amherst were abruptly severed by both Williams and Wesleyan.

BASKETBALL. The basketball season extending through the winter of 1901-02 was marked by a greatly increased interest in all quarters, especially among the college teams. The college championship was won by Yale, with a score of 5 games won and 3 lost. Harvard and Princeton followed each with 4 games won and 4 lost, Columbia won 3 and lost 3, and Cornell won 2 and lost 4. Amherst stood at the head of the New England Intercollegiate Association with 4 victories and no defeats, followed by Williams and Dartmouth each with 2 games won and 2 lost, and Trinity and Holy Cross, each with 1 game won and 3 lost. In the Amateur Athletic Union the Seventeenth Separate Company, of New York, won the Metropolitan Association championship with 7 victories and no defeats, and the Central Association championship (Chicago), was won by the Central Y. M. C. A. with 3 games won and none lost.

BASUTOLAND, an inland British colony lying between eastern Cape Colony and the Orange River Colony, has an estimated area of 10,293 square miles. The estimated native population in 1901 was 263,500; Europeans, who are not allowed to settle in the country, numbered 647. The colony is administered by a resident commissioner under the high commissioner for South Africa. For the fiscal year 1901 the revenue and expenditure amounted to £74,891 and £55,486 respectively; for 1902, £104,284 and £64,809 respectively. There is no public debt. The exports are largely grain, cattle, wool, and horses. In the fiscal year 1901 the dutiable imports were valued at £145,474 and the total exports at £361,647; in 1902, £230,708 and £166,894 respectively. In July, 1902, the chief Joel Molapo was condemned to a year's imprisonment and to pay a fine of 500 cattle for high treason and for fighting against his brother Hiesen. Throughout the Boer war he was inclined to favor the Boers and was generally unwilling to obey the instructions of the resident commissioner.

BAUXITE. See MINERAL PRODUCTION.

BEACH, JOHN WESLEY, seventh president of Wesleyan University, died at Middletown, Conn., January 1, 1902. He was born at Trumbull, Conn., December 26, 1825, and in 1845 graduated at Wesleyan. He taught for some years in the Amenia Seminary, was ordained a Methodist minister in 1884, and held pastorates in New York City, Brooklyn, Bridgeport, and New Haven. In 1880 he was made president of Wesleyan, and held that position until 1887 when he resigned, and became presiding elder of the Brooklyn district. His college administration was marked by his liberal views and executive ability, while in religious circles he was known as a forceful and effective preacher.

BEARDSHEAR, WILLIAM MILLER, an American educator, died at Ames, Ia., August 5, 1902. He was born in Dayton, O., November 7, 1850, and received his education first at Otterbein University, from which he later received the degrees of M. A. and LL. D., and at Yale University. From 1881 to 1889 he was president of the Western College in Toledo, Ia., superintended the public schools at Des Moines from 1889 to 1891, and then until his death was president of the Iowa State College

of Agriculture and Mechanical Arts. Among other offices held by him are president of the Iowa State Teachers' Association in 1894, president of the National Educational Association, member of the jury for educational awards at the Pan-American Exposition, and United States Indian commissioner from 1897.

BECHUANALAND PROTECTORATE, a British South African dependency, has an estimated area of 213,000 square miles and an estimated population of 200,000. Lying between German Southwest Africa on the west and Southern Rhodesia and the Transvaal on the east, it extends from the Molopo River, the northern boundary of the former Bechuanaland Colony (now a part of Cape Colony) northward to the Zambesi. The three great chiefs, Khama, Sebele, and Bathoen, continue to govern their own people under the protection of Great Britain, which is represented by a commissioner resident at Mafeking, who acts under the high commissioner for South Africa. The people are peaceable and engage in cattle raising and to some extent in agriculture. No licenses are issued for the sale of spirituous liquors. About 400 miles of the Rhodesian ("Cape-to-Cairo") Railway run through the eastern part of the protectorate.

BEET SUGAR. See SUGAR INDUSTRY.

BEIT, ALFRED, a South African capitalist, came into greater prominence by the death of Cecil Rhodes on March 26, 1902, which left him probably the wealthiest and most influential financier in South Africa. He was born of Jewish parentage at Hamburg, Germany, in 1853, and while still a young man went to South Africa and entered the diamond mining business. When the De Beers Consolidated Mines, Ltd., was formed in 1888 to exploit the chief South African diamond mines, Mr. Beit became a life governor. In 1895 he was in the secret of the Jameson Raid and afterward gave testimony before the parliamentary committee that investigated the affair. From the time that Rhodes consummated his great consolidation of the diamond mines, he and Mr. Beit were in close business association, and the latter is one of the executors of the famous Rhodes will. The South African millionaire is also much the largest shareholder in the Rand Mines, Ltd. His wealth has been estimated at \$375,000,000, but, unlike Rhodes, he has never been interested in politics of any kind that would not increase his wealth.

BELGIUM, a constitutional monarchy of western Europe lying between France and the Netherlands, and bordering on the North Sea. The capital is Brussels.

Area and Population.—The area of the nine provinces of Belgium aggregates 11,373 square miles, and the population, according to the census of December 31, 1900, was 6,687,651, an increase of 618,330 since 1890. The populations of the principal cities in 1900 were: Brussels (with suburbs), 561,782; Antwerp, 285,000; Liège, 173,708; Ghent, 160,949; Mechlin, 56,013; Verviers, 52,203; Bruges, 52,867. The greater part of the population are adherents of the Roman Catholic Church, the Protestants numbering only about 10,000. The state supports a graded educational system.

Government.—The executive power is vested in the king, succession being in the direct male line in order of primogeniture. The reigning sovereign is Leopold II., who succeeded in 1865. He is assisted by a ministry of eight members, appointed by himself and responsible to the chamber of representatives. The legislative power is exercised jointly by the king and parliament. Parliament consists of two houses, a senate elected partly by direct popular vote and partly by the provincial councils for a term of eight years, and a chamber of representatives, elected directly. There are universal suffrage, with plural voting on property and educational qualifications, and a system of proportional party representation. There are representative councils in both provinces and communes. In 1902 the ministry was as follows: Premier and minister of finance and public works, Count de Smet de Naeyer; minister of interior and instruction, M. de Trooz; minister for foreign affairs, Baron P. de Favereau; minister of justice, M. van den Heuvel; minister of agriculture, Baron van den Bruggen; minister of war, Gen. Cousebant d'Alkemade; minister of railways, posts, and telegraphs, M. Liebaert; minister of industry and labor, Baron Surmont de Volsberghe until August 19, 1902, when he was succeeded by M. G. Francotte.

Army.—The regular army, recruited on a system of conscription that permits substitution, numbers on a peace footing (1902) 51,522 officers and men. The annual contingent comprises 13,300, and the legal period of service is eight years in the active army and five years with the reserve. The war strength of the army is 143,000, and there is a *garde civique* of 43,647. There is no navy.

Finance.—The unit of value is the franc, worth 19.3 cents. The revenue, largely derived from state railways, customs, excise, and personal and property taxes, amounted in 1901 to 488,429,760 francs, and the expenditures, in which the largest items were railways, public debt, army, and public works, to 488,047,973 francs. The budget for 1902 placed receipts at 489,040,050 francs and expenditures at 488,344,403

francs. The national debt on January 1, 1902, amounted to 2,778,051,350 francs, the greater part of which was incurred in the construction of the state railways and other public works.

Industries.—Manufacturing is the principal industry of the country, and although over 65 per cent. of the area is under cultivation, the greater part of Belgium's food supply has to be imported. The principal crops are oats, rye, wheat, barley, hops, potatoes, and beets. Of the mineral products, coal is the most important, 22,073,740 tons being mined in 1901, but the mining of iron, zinc, lead, and copper is also carried on extensively. The chief manufactures include iron and steel products, firearms, machinery, glass, leather goods, cottons, laces, linens, woolens, hosiery, paper, and beer.

Commerce.—The special commerce of Belgium for 1901, as compared with 1900, shows an increase in imports and a decrease in exports, the imports having increased in value from 2,215,800,000 francs to 2,221,000,000 francs, and the exports fallen from 1,922,900,000 francs to 1,828,200,000 francs. The transit trade increased from 1,374,600,000 francs in 1900 to 1,411,200,000 francs in 1901. The imports are largely food-stuffs and raw materials, the exports manufactured articles. The imports in 1901 were obtained principally from France, the United States, Germany, and England in the order named, and the exports were sent for the most part to Germany, France, Great Britain, and the Netherlands. The trade with the United States is growing annually, the imports increasing from a value of 266,674,000 francs in 1900 to 335,700,000 francs in 1901, and the position of the United States among nations furnishing imports advancing in that year over Germany and Great Britain from fourth to second place.

Communications.—The railways in operation at the end of 1901 amounted to 2846 miles, of which 2516 miles were owned by the state. The gross receipts from the state roads in 1900 amounted to 209,194,311 francs, and the expenditure upon the same to 140,428,195 francs. The navigable rivers and canals have a length of 1370 miles.

HISTORY.

The Suffrage Agitation.—The reform of the suffrage continued to be throughout 1902, as it had been during 1901, the most vitally important political problem of the day in Belgium. The agreement entered into in 1901 between the Liberals, Radicals (or Progressists), and Socialists in parliament in their attempt to force from the Clerical-Conservative majority some scheme of electoral reform, was strengthened during 1902 by an amalgamation of the forces of the parties at the polls at the spring elections. The basis of union was a programme of suffrage reform which included a demand for universal suffrage on the plan of "one man, one vote," and the general extension of the principle of proportional representation to the communal elections. With this went the demand for the abolition of plural voting, by means of which the Clerical party had so long been able to hold an artificial predominance in national affairs. The progress of the movement for reform was marked this year, however, by more activity outside of the halls of parliament than within it. The Clericals have apparently come to a realization that unless they can disrupt the allied forces of the opposition they will not much longer be able to withstand their demands, and that compromise of some sort is the only alternative to a resort to force from the employment of which they naturally shrink, and to which it is very unlikely that King Leopold, who knows his unpopularity and feels the insecurity of his crown would consent. Early in 1902 reports were current that the Clericals contemplated a *coup* of a most radical nature in case the opposition continued to make headway. This was no less than a consent to female suffrage, which is part of the programme of the Socialists, but is not acceptable to either the Liberals or the Progressists. By such a stroke the Clericals, so it was declared, could reasonably hope to detach the Socialists, for the time being, at least, from their alliance with the other two parties, and at the same time introduce into the suffrage an element which students of Belgian political conditions declare would give them a renewed lease of power for many years to come. Another cause for Clerical hopes of continuation in power, is said to be in the rather half-hearted acceptance of the demand for extension of proportional representation to the communes, by the Liberals who, by the existing system of plural voting, have been enabled to gain control of the city governments in Ghent, Antwerp, Brussels, and other centres of population in which a well-to-do burgher class exists.

The Socialist Attitude.—The entire impracticability of the Clerical design, if such had existed, of detaching the Socialists from the other opposition forces, was shown early in 1902 by antagonism between the government and Socialist elements in parliament, which as the year progressed was strengthened by popular agitation and developed into the most serious opposition that the Clerical régime has had to face in several years. At the opening session of the chamber, January 14, the inherent

hostility of the Socialists was made evident by a bitter contest between the forces of the premier, Count de Smet de Naeyer, and the Socialists, under the leadership of M. Neujeau, on account of the government's withdrawal of a bill regarding parliamentary salaries, which had already been passed by the chamber at a previous session, the Socialists declaring that withdrawal was illegal. It was believed that the struggle had been precipitated not so much because the Socialists considered the matter one of vital importance, as because it afforded an opportunity for them to serve notice on the government of their unalterable opposition to all parts of the ministerial programme, until their demands regarding suffrage reform had been acceded to.

The Suffrage Riots.—The agitation of the Socialists in behalf of universal suffrage culminated at length in rioting and bloodshed. The contest began in the lower house of parliament on March 19, 1902, with the defeat of two proposals submitted by the Socialists, one providing for universal suffrage without regard to sex, which was voted down by 92 votes to 24, and another providing for manhood suffrage, which was rejected by 92 votes to 45. At once the leaders of the Socialists set under way an active propaganda of agitation. Every day mass meetings were held in the Maison du Peuple. The leaders hoped, by means of monster mass meetings, and processions, and petitions, to impress the government with the power of the public sentiment in their favor. The programme included the marshalling of armies of workmen in different sections of the country, and marching them to the capital to overawe the legislators. These measures failing, the general strike was to be resorted to. This was voiced in the *Peuple*, the leading Socialist organ, which declared that "As we are not living in the year 1848, during which a revolutionary movement could still succeed, we must have recourse to the general strike." Rioting began on April 9, when King Leopold was almost mobbed at the Brussels railway station. The mob, gathering in front of the Maison du Peuple, marched through the streets, singing revolutionary songs, and shouting "Vive la République!" The leading factor in the riots was the organization known as Young Socialist Guards. On the following day (April 10) the debate in the chamber was exceptionally stormy, and resolved itself into a struggle between the Socialists and Ministerialists over the question of whether the bill for a revision of the constitutional provisions relating to the suffrage should be considered before or after that voting provisional credits to the minister of finance. The government applied closure and carried its point. Rioting was particularly severe on the night of April 12, when the troops ordered to clear the streets fired upon the mob. The casualties for the night were reported at three killed and 100 wounded. On April 14 a general strike was declared, and between 200,000 and 300,000 workmen ceased work, and in the next few days the strike extended largely to the industrial communities. The firm measures adopted by the government, taken together with the attitude of a large element in the population who, though not identified with the Clerical party, decried the lawless means adopted by the Socialists, served to bring the disturbances to an end and hastened the return of the striking laborers to work.

The Attitude of the Liberals.—Perhaps the most significant phase of the suffrage agitation was the attitude of the Liberal party. Hitherto the Liberals have been united with the Socialists and Progressists in the demand for universal suffrage, but during the April riots the Liberal members gave their support to the Clerical majority in the parliamentary struggle and the Liberal press generally supported the ministerial measures for the suppression of the disorders. It is not at all likely that this refusal of the Liberals to participate in or lend aid to the Socialistic agitation means anything more than a recognition that the success of the principles for which they contend will be obtained sooner by a strict observance of the public order than by riot and revolution. There is no likelihood that there will be any abatement of Liberal opposition to Clericalism. The chief Liberal organ, the *Indépendance Belge*, presents the following startling indictment of the party in power: "Instead of educating the people—we have 25 per cent. of illiterates—the public schools have been closed, and those schools developed in which religious instruction is given; instead of doing away with the unjust tax on food, it has been increased; instead of resolutely opposing alcoholism, it has been tolerated, and indirectly encouraged; instead of establishing social justice in the army, the power of money has, on the contrary, been increased, and the gulf separating rich and poor made wider; instead of honorably applying the constitutional principle of the plural vote, it has been misused, and all fraudulent misapplications of it have been, if not encouraged, at least endured."

The May Elections.—Elections for a partial renewal of the chamber, held May 26, 1902, had a peculiar interest in view of the recent riots. The election resulted in the choice of 57 Clericals, 20 Liberals, 13 Socialists, and 1 Christian Democrat—a result which would on its face seem to indicate a Clerical victory, but it was pointed out that most of the elections occurred in Clerical constituencies where the success of

that party was to be expected. The new chamber is composed of 96 Clericals, 34 Liberals, 34 Socialists, and 2 Christian Democrats.

Anti-Gambling and Military Reform Bills.—Two measures that have caused protracted discussion in the legislature for several sessions became laws in 1902. The first, a bill for the suppression of licensed gambling had passed back and forth between the senate and chamber several times during 1901 without any sort of agreement being reached because of the insistence of the senate upon incorporating into the act provision for an indemnity to be paid to the notorious gambling places at Ostend and Spa. The threatened deadlock was at length averted by the introduction of a new measure by the minister of finance (January 14), granting an indemnity of 7,000,000 francs for the suppression of these places, which was accepted by the chamber and passed by the senate. The military reform bill, which provided for an increase of the effective strength of the army by about 20 per cent., the abolition of substitution (*remplacement*), the extension of the volunteer service and consequent curtailing of the conscriptive system, and the shortening of the term of active service was passed by the chamber on January 24 by a vote of 74 to 42 and by the senate on March 20 by a vote of 56 to 39.

The Question of Sunday Labor.—Early in 1902 a bill was prepared by the Conseil Supérieur du Travail for the abolition of Sunday labor. The industrial population of Belgium is one of the hardest worked in all Europe, and to a great proportion of the smaller shop-keepers, artisans, and mechanics observation of the fourth commandment is practically unknown. Even clerks and warehouse employees under the existing régime may be legally held to a performance of their duties on Sundays as well as week-days. The measure did not aim at a reform in national customs or habits, but was intended only to provide that Sunday work be entirely optional. It is unlikely, indeed, that any legislation of this character would effect a radical change at once in the industrial life of Belgium.

Working of the Old-Age Pensions Act.—After a year's trial the Old-Age Pensions Act, which went into effect on August 1, 1901, had proved a source of considerable embarrassment to the government. There were 165,000 applications for pensions on file when the act went into operation, and during the year the demands for pensions unexpectedly increased by more than 30,000, thus completely upsetting the calculations on which the minister of finance based his estimate for providing the necessary funds. The act provides an annual pension of 65 francs for indigent workmen who have attained the age of 65. An inquiry has revealed the fact that heads of local committees and the burgomasters who have charge of the recommendations in the communes have admitted a large number of applicants not entitled to the bounty. The act limits the pensions to *bona fide* laborers, but the pension lists disclose a large proportion of retired tradesmen, small property owners, and others of a similar class. In view of these revelations, the government determined to dissolve the local committees entirely and substitute a committee of inquiry in order to bring the lists within the strict meaning of the act.

Death of the Queen and the Episode of Princess Stéphanie.—Marie Henriette, Queen of the Belgians, died at Spa, Belgium, September 19, 1902. For years the greatest sympathy had been felt for the queen not only in Belgium but throughout Europe because of the outrageous treatment she received from King Leopold. The death of the queen was followed by an event that intensified the feeling of the Belgian people against a sovereign who long before had forfeited their respect. The second daughter of the king and queen is Princess Stéphanie, who married, in 1881, the Crown Prince Rudolph of Austria, whose mysterious death, in January, 1889, shocked all Europe. For several years the king and the princess have not been on good terms, and when, in 1900, Princess Stéphanie married Count Lónyay, a Hungarian nobleman, King Leopold disowned her. Upon hearing of her mother's death Princess Stéphanie hastened to Belgium from England, where she has of late made her home. At the Villa Henriette, at Spa, where the body of the dead queen lay, the princess was received by her younger sister, the Princess Clémentine, but when King Leopold learned of her arrival he declined to receive her, ordered her to leave the villa at once, and refused her permission to attend the funeral ceremonies. This action of Leopold brought forth expressions of reproach and resentment from the European press, and is said to have aroused the sympathy of the Emperor Franz Josef, of Austria, for his son's widow, whose re-marriage he has forgiven.

Attempted Assassination of King Leopold.—An attempt to assassinate King Leopold was made November 15, 1902, by an Italian anarchist named Rubino, who fired three shots at him as he proceeded from his palace in Brussels to the cathedral to attend a *Te Deum* in memory of Queen Marie Henriette. None of the shots took effect. The would-be assassin was seized by the mob, from whom he was rescued by the police with considerable difficulty. On examination he admitted that he was an anarchist, and said he regretted that he had not been successful. The

Italian authorities identified him as a criminal who had been imprisoned in Italy for robbery in 1893 but had escaped to England.

The Congo Free State, which is practically a Belgian colony, is treated under its own title.

BELOOCHISTAN, or BELUCHISTAN. See **BALUCHISTAN.**

BENJAMIN, ANNA NORTHEND, an American journalist and magazine writer, died January 20, 1902. She was born in Salem, Mass., October 6, 1874, and in 1893 graduated at St. Gabriel's School, Peekskill, N. Y. As a special correspondent during the Spanish-American War she attained considerable distinction for reportorial exploits, and was in Santiago the day after its surrender. For six months she served in the Philippines as correspondent for the *New York Tribune* and the *San Francisco Chronicle*, traveled subsequently in China, Japan, and Corea, and made the hazardous overland journey through Siberia and Russia. On her return to America she contributed widely to periodicals and lectured upon her travels.

BENJAMIN-CONSTANT, JEAN JOSEPH. See **CONSTANT, JEAN JOSEPH BENJAMIN.**

BERMUDA, a British colony consisting of 360 small islands in the Atlantic lying 580 miles off the North American coast. The total area of the group is 20 square miles, and the population (1901) 17,535. The chief town, Hamilton, on Bermuda, or Main Island, has a population of 2246. An imperial force of about 3000 troops is maintained, and the islands also serve as an important naval base and fitting station for the British North Atlantic and West Indian squadrons. The colony is administered by a governor (Sir Henry LeGuay Geary, appointed 1902), assisted by executive and legislative councils, and a representative assembly. The revenue in 1900 was £40,124, of which £32,394 accrued from customs, and the expenditure £47,532. The public debt is £49,600. In 1900 the exports amounted to £93,769 and the imports to £397,136. The trade is largely with the United States, and large quantities of potatoes and onions are grown for the early spring supply of the New York market. Lily bulbs are also extensively grown for export. The islands are a favorite winter resort for Americans, the recent development of the hotel and tourist business adding materially to the prosperity of the colony.

BERNIER, CAMILLE, a French landscape-painter, died in May, 1902. He was born at Colmar in 1823, and was a pupil of Léon Fleury. His study of art was begun in middle life, and he exhibited at the Salon first in 1863. By 1873 he had become a member of the jury of the Salon. In 1868, 1869, and 1878 he received medals, and in 1872 became a member of the Legion of Honor. Nearly all his subjects are drawn from Brittany. His works include: "Kerluce" (1857), "Rocks Near Plousgastel" (1859), "Village of Plounésur" (1863), "Heath Near Bannalec" (1867), "Heath of Kerbagadie," "Fountain in Brittany" (1869), "January in Brittany" (1872), "Woodenshoe Makers in the Woods of Quimerch" (1877), "Mist and Sunshine" (1884), and "A Farm in Brittany" (1891).

BERTRAND, ALEXANDRE LOUIS JOSEPH, French archæologist and art historian, died December 8, 1902. He was born in Paris, June 28, 1820, and was educated at the Normal School and at the French College in Athens. In 1862 he was made director of the Museum of Saint Germain, to which at the foundation he had made valuable contributions, and in 1882 became professor of archæology at the school of the Louvre. In 1885 he was made an officer of the Legion of Honor. Besides contributions to the *Revue archéologique*, of which he was for a time editor, he published: *Etudes de mythologie et d'archéologie grecques* (1858), *Les Voies romaines en Gaule* (1863), *Archéologie celtique et gauloise* (1876), *La Gaule avant les Gaulois, d'après les monuments et les textes* (1884), *Etudes sur la peinture et la critique d'art dans l'antiquité* (1893), *Les Celtes dans les vallées du Pô et du Danube* (with S. Reinach, 1894).

BIBLE SOCIETY, AMERICAN, founded in 1816 for the gratuitous distribution of Bibles among the destitute and the poor. The issue for the fiscal year 1901-02 amounted to 1,723,791 copies. During its eighty-six years of existence the society has distributed 70,677,225 Bibles, including those in foreign tongues and the languages of several American Indian tribes. The society has received since its organization contributions exceeding \$30,000,000. It issues an illustrated monthly, *The Bible Society Record*, besides thousands of leaflets annually. Secretaries, Rev. John Fox, D.D.; Rev. William L. Haven, D.D., and Rev. E. P. Ingersoll, D.D., Bible House, New York City.

BICYCLING, as a sport, is treated under **CYCLING** (*q.v.*).

BIERSTADT, ALBERT, an American landscape-painter, died in New York City, February 18, 1902. He was born in 1830 at Dusseldorf, Germany, was brought to

the United States when a year old, received a common school education at New Bedford, Mass., and from 1853 to 1857 studied under Lessing at Düsseldorf, and also at Rome. In 1858 he made a sketching tour through the Rocky Mountains, principally in connection with the expedition sent out under Gen. F. W. Lander for the survey of an overland wagon route. He visited Europe in 1867, 1878, and 1883, and in 1860 was elected to the National Academy. He received medals in Belgium, Austria, and Germany, and numerous foreign decorations. His studio was until 1882 at Irvington, N. Y., and thenceforth in New York City. A follower of the Düsseldorf school in landscape, he was expert in draughtsmanship, but in color somewhat dry and severe. He applied the Düsseldorfian manner to a presentation of the heroic scenery of the Sierras and the Rockies, and with Thomas Moran and Frederick E. Church introduced into American art a panoramic method which was at the same time distinctly national. His study of nature was at first hand and careful; his interpretation of it always effective. Tuckerman, in his *Book of the Artists* (New York, 1867), asserts that no more sincere and noble work than Bierstadt's "Rocky Mountains" (1863) exists in American landscape art. Among Bierstadt's other pictures may be mentioned: "North Fork of the Platte" (1864), "Storm in the Rocky Mountains" (1866), "Valley of the Yosemite" (1866), now in the collection of the Lenox Library, New York City; "Mount Corcoran, Sierra Nevada" (1878), in the Corcoran Gallery, Washington, D. C.; and two historical pictures, "The Settlement of California" and "The Discovery of the Hudson River," in the Capitol at Washington.

BILLIARDS. The National Association of Amateur Billiard Players held its tournament (14-inch balk-line) in Brooklyn, N. Y., in January, 1902. The winner was Edward Gardner, of Brooklyn, who won four games and lost none, made a high run of 52 and a grand average of 5.48. The other contestants finished as follows, with games won and lost, high run and grand average: J. Byron Stark, New York, 2, 2, 37, 5.15; A. R. Townsend, New York, 2, 2, 39, 5.26; F. Poggenburg, New York, 1, 3, 40, 5.88; F. C. Gardner, New Jersey, 1, 3, 38, 5.13. The tournament of the Amateur Athletic Union (the parent body) at 14-inch balk-line took place in New York City, in February, when the championship was again won by W. P. Foss, of Haverstraw, N. Y. The standing of the players was: C. S. Norris, New York, 5, 1, 62, 6.43; W. H. Sigourney, San Francisco, 5, 1, 64, 5.50; L. L. Mial, New York, 4, 2, 90, 7.28; C. F. Conklin, Chicago, 3, 3, 45, 6.11; C. G. Threshie, Boston, 2, 4, 52, 5.97; A. B. Miller, New York, 1, 5, 43, 4.74; J. A. Hendrick, 1, 5, 34, 4.62. The tie was won by Norris, who in turn was defeated by Foss, 500 to 404.

BIOLOGICAL STATIONS. See ZOOLOGICAL EXPEDITIONS AND STATIONS.

BIOLOGY. Undoubtedly the most widely discussed question in general biology during 1902 was that of heredity, especially with reference to what is known as Mendel's law. Gregor Mendel, abbot of Brunn (Moravia), many years ago in the quiet of the cloister carried on experiments in the hybridization of plants and enunciated the law that now bears his name. But his work was soon forgotten and was brought to the notice of modern biologists only two years ago. Early in 1902, the well-known English biologist Bateson published a small but vigorously written pamphlet supporting Mendel's views, and soon afterwards published a larger work, including results of experiments. Briefly stated Mendel's law is essentially this: In the second and later generations of a hybrid there occur all the possible combinations of the characters of the parents, and in definite proportions. So far most of the evidence in support of this law seems to have been derived from the hybridization of plants, although there is some evidence to show that the same law holds among animals. One of the most important contributions to the discussion was furnished by the well-known American cytologist E. B. Wilson, who late in 1902 called attention to the fact that two students at Columbia University, one a zoologist and one a botanist, working independently, seem to have found in the normal phenomena of the maturation of the germ-cells an explanation, or at least a clue to the explanation, of Mendel's principles of inheritance. This explanation is dependent upon the separation of paternal and maternal elements and their ultimate isolation in separate germ-cells. Should these investigations prove to be as important as they seem, they will very greatly influence biological opinion as to the laws of heredity.

During the early part of 1902, Dr. G. Adlerz, a Swedish zoologist, called attention to a very important law of variation in living organisms which seems to have been hitherto overlooked or at any rate neglected. He states it thus: "During the increase of a species, both the absolute and relative number of varying individuals as well as the amplitude of the variations are increased beyond what is usual." This evidence was drawn chiefly from observations made upon butterflies, but his conclusions have been supported by other writers, notably Prof. W. M. Wheeler, of the University of Texas, who has clearly shown that ants "furnish a brilliant illustration of the evolutionary factor to which Adlerz has called attention." Wheeler

further shows that unfavorable conditions tend to inhibit variability, and he concludes that "the manifold and often wonderfully perfect morphological and psychological adaptations which have made ants the dominant group among terrestrial invertebrates, have their origin in the variability so greatly enhanced by the production of enormous numbers of individuals and the care and protection afforded, through a most important period of their lives, to the reproductive individuals of the colony."

There continued throughout the year the discussion of the unsolved question of the determining factor in evolution, one side holding to the direct action of the environment, the other to the influence of natural selection working on congenital variations. The most important contribution to the discussion was made by Prof. James M. Baldwin, of Princeton University, who has elaborated and fully explained his theory of *orthoplasy* in his recent book (see ZOOLOGICAL LITERATURE). Although this theory was originated some time ago by three independent workers, it is now set forth fully and cogently for the first time. It is impossible to do it justice in a few words, but it is in brief a sort of compromise between the two contending schools, since it holds that adaptations to environment, acquired by an individual, even though not inherited, protect it from destruction, and thus such individuals and successors similar to them are preserved until congenital variations occur upon which natural selection can work. It is possible that this theory may prove to be the key to the solution of the problem of organic evolution, but it will probably be a long time before the Neo-Lamarckians and the Neo-Darwinians will lay down their arms.

At the meeting of the Corporation of the Marine Biological Laboratory, held August 12, 1902, the director, Prof. C. O. Whitman, read an important paper on *A Biological Farm*, in which he set forth the great importance of an establishment for the experimental study of heredity, variation, and evolution, and for investigations into life-histories, habits, instincts, and intelligence. He showed beyond doubt the great importance of such a "farm," and outlined it on such a broad scale that an endowment of one million dollars would be needed to start it in a satisfactory way. The foundation of such an establishment will be eagerly awaited and enthusiastically welcomed by all biologists, though it is doubtless true that many would dissent from Professor Whitman's conclusion that Woods Hole is the ideal location for it.

An interesting experiment going on in the Pribilof Islands for some years past was called to the attention of biologists during 1902. The attempt is being made to increase the relative number of female blue foxes of Saint George Island, and change a naturally monogamous animal into a polygamous one. This is being done by trapping the foxes and killing three-fourths of the males, but releasing all the females. This plan, it was thought, would result in a marked increase in the total number of foxes and in the relative number of females. Thus it was estimated that at the end of four years there ought to be more than 2500 females to less than 400 males. The statistics published in August, 1902, show, however, that at the end of the 1901 season there were only 690 females counted on the island, while there were 614 males. Explanations suggested are that more males than females are born, and that the females are not so readily trapped, as they are known to be more wary than the males. There has been, however, a distinct gain in the number of females, though there is no evidence yet that the fox is becoming polygamous. See ZOOLOGICAL LITERATURE; ZOOLOGICAL SOCIETIES.

BIRD PROTECTION. See ORNITHOLOGY.

BIRTH RATE. See VITAL STATISTICS.

BISMARCK ARCHIPELAGO, a German protectorate lying east of New Guinea, has an estimated area of 19,200 square miles and an estimated population of 188,000. The protectorate is administered by an imperial commissioner, stationed at Herbertshöhe, who also administers German New Guinea and the Caroline, Pelew, Marianne, and German Solomon islands. In the fiscal year 1900 imports were valued at 1,240,925 marks, and exports 907,282 marks. Of the latter 651,141 marks represented copra, and 110,634 marks trepang. The mark is worth 23.8 cents.

BLOCH, JEAN DE (Russian form Ivan Stanislavovich Bloch), a Polish-Jewish financier, economist, and military critic, who died at Warsaw, Poland, January 7, 1902, was best known as an advocate of universal peace. He was born at Radom, Poland, in 1836, and studied at the Industrial High School of Warsaw. Becoming interested in the construction of Russian railways, he took part in the building of the Great Russian Company's lines, organized the company of the Southwestern Railroads, and built the Ivangorod Dombrova and Landvarovo-Romny roads. Railway legislation was furthered by him, and he held the presidency of various lines. His volumes on matters of railway enterprise won for him continental recognition and an appointment to the committee of scholars in the ministry of finance. He was also foremost in the movement for Polish industrial advance, and almost constantly

occupied with philanthropy or scientific investigation among the poorer classes. A compendious publication in five volumes (with an atlas), comparing the general welfare of the Vistula and Western Great Russian provinces, contained a history of the Jews in Europe, and examined the origin of anti-Semitism. As a peace propagandist, Bloch became known by articles in French, German, and English periodicals, his war-and-peace museum at Lucerne, and more particularly his *Budushchaya Voina* (7 vols. 1898), translated in a much abridged form into English by R. C. Long as *The Future of War in Its Technical, Economic and Political Relations* (1899; in England, as *Is War Now Impossible?*). This work, which is said to have influenced Czar Nicholas II. to the issuance of the peace declaration resulting in the Hague Conference of 1899, elaborates with a wealth of often ill-arranged or irrelevant details the thesis that constant improvement in the art of warfare tends to the final impossibility of war. The principal argument holds that, under such conditions of improvement, any considerable war would result in the starvation of the hostile powers, and consequent revolution against, and destruction of, the respective states.

BOERS. See TRANSVAAL.

BOKHARA. See CENTRAL ASIA, RUSSIAN.

BOLIVIA, an interior republic of South America, lies between Brazil on the east and Peru and Chile on the west. The capital is La Paz.

Area and Population.—The eight departments and two territories (Purus and Madre de Dios) comprising Bolivia have an estimated area of about 734,000 square miles. The boundary dispute with Peru was still pending in 1902. In that year announcement was made of the settlement of the Brazilian boundary question, pursuant to which a large area was transferred to northern Bolivia. This area incorporates in Bolivia the upper Jurua and the upper Purus with their affluents including the Irahucua, Embira, Acre and Hyuacu. The actual demarcation, however, had not been made. In his message to the congress, August 10, 1902, President Pando stated that the boundary question with Argentina had been settled and that a mixed commission was then in charge of the survey. In 1902 the results of the Bolivian census of September 1, 1900, were only partially available. The results published, however, indicated a population of about 1,853,400, though the inhabitants have been officially estimated at 2,313,750. Probably over 80 per cent. are Indians and nearly 80 per cent. of the remainder mestizos. The population of La Paz has been reported at 62,000; Cochabamba, 49,500; Sucre, 28,000. The state religion and that prevailing among the people is Roman Catholicism. Primary education is free and nominally compulsory. Some provisions are made for secondary and higher education.

Government.—The chief executive is a president, who is assisted by a cabinet of five members. The legislative power devolves upon a congress of two houses, the senate and the chamber of deputies. The president in 1902 was Gen. José Manuel Pando, who assumed office October 26, 1899, having been elected by a national convention of sixty members. The departments are administered by prefects. The regular army is reported to number about 2500, and the reserves about 80,000.

Finance.—The monetary standard is silver and the unit of value the boliviano, worth 42.8 cents on October 1, 1901, and 38.4 cents on October 1, 1902. Revenue is derived mainly from customs, and the largest items of expenditure are for war and public works.

Reports of actual receipts and expenditures are not available. The estimated revenue and expenditure for 1900 were 7,331,400 bolivianos and 7,930,188 bolivianos, respectively; for 1901, 7,965,350 bolivianos and 8,152,359 bolivianos, respectively; for 1902, 10,117,700 and 9,989,153, respectively. The total debt in 1901 was reported at 17,861,872 bolivianos, of which 4,004,020 bolivianos represented the internal debt.

Industries and Commerce.—Agriculture and mining are the principal industries, but each, in proportion to the capabilities of the country, is little developed. This lack of progress is due both to the character of the people and the difficulties of transportation. The chief vegetable product is rubber; others are cacao, cinchona, and coffee. Cereals and other foodstuffs are grown for domestic consumption. The most important mineral products are silver, tin, and copper. The values in bolivianos of imports and exports are stated as follows:

	1898	1899	1900	1901
Imports.....	11,897,245	12,889,902	13,844,114	16,953,224
Exports.....	27,456,677	27,365,747	35,067,690	37,578,211

The principal imports are cottons, woollens, provisions, hardware and machinery, cattle, alcoholic liquors, and clothing. In 1901 the leading countries from which imports were received were: Germany, 3,243,090 bolivianos; Great Britain, 2,291,851; France, 1,912,275; United States, 1,674,255; Chile, 1,663,907; Peru, 1,543,233; Belgium,

1,305,958; Italy, 679,368; Argentina 604,802. German imports are increasing. The exports for 1901 were classified as follows: Mining products, 26,855,426 bolivianos; agricultural products (including rubber), 9,688,513; manufactures (including stamped silver), 535,937; stock products, 373,503; miscellaneous, 124,832. The leading articles exported in 1901 were: Silver, 14,566,661 bolivianos; tin, 9,380,714; crude rubber, 9,151,824; bismuth, 1,463,088; copper, 1,112,599; stamped silver, 411,831; cacao, 259,513.

Communications.—Numerous railways are projected, but the only completed line is the Oruro, extending from that town to Antofagasta (Chile), 575 miles distant. From Unguni, 379 miles from Antofagasta, a branch line extends 22 miles to the Huanchaca mines. In the summer of 1902 track was laid to the 33d mile on the line building from Guaqui, on the Desaguadero River, to La Paz. Communication between western Bolivia and the northern river country is slow and difficult.

History.—In Bolivia the most important events during 1902 concerned the great rubber producing region of Acre, in the northern part of the republic. The subject was of such apparent importance that it had a place in three presidential messages, moved the Bolivian government to appeal for the intervention of the United States, and culminated in the mobilization of Bolivian troops near the end of the year. It was announced early in 1902 that the Bolivian government, through the instrumentality of Sir Martin Conway, the English explorer, practically made over the Acre region to an Anglo-American syndicate, the concessionaire named being Mr. F. W. Whitridge, of New York. The concession was approved by the Bolivian congress. The syndicate was to form a corporation, which would enjoy a large measure of autonomy, administering the country somewhat in the manner of the British chartered companies. Almost immediately the validity of this contract was denied by the Peruvian government, which, on the ground that the concession included territory claimed by Peru, entered protest with the representatives of the syndicate and with their governments. Still more embarrassing opposition was made by Brazil. Though Brazil had received from Bolivia an offer of 20 per cent. of the latter's interests in the syndicate for its good will in the matter of the concession, the Brazilian government was uncompromising. It is fair to assume that in no small degree this opposition was based upon the commercial disadvantage that the consummation of the syndicate plan would have for Brazilians. The reasons stated to the Bolivian government, in a note dated April 14, 1902, were that a part of the territory leased was still a subject of contention with Peru, and that in effect Bolivia had agreed to give up her sovereign rights in the Acre region by permitting the syndicate the use of military force, a concession that the government of Brazil could not approve. It appears that the attitude of both Brazil and Peru was to some extent actuated by fears, common also to other South American countries, that the establishment of the foreign corporation with semi-independent rights was only preliminary to direct interference on the part of the United States in South American affairs. Moreover, since the boundary, though agreed upon by treaty, was not yet marked, Brazil regarded it as highly probable that in the syndicate concession Bolivia had encroached upon Brazilian territorial rights. The keen resentment of the Brazilian government is seen in a note of the same date, April 14, asking Bolivia to withdraw the treaty of commerce and navigation which the latter had submitted for approval; while in June it was announced that Brazil had notified Bolivia that if the Acre concession were not rescinded, diplomatic relations would be broken off and interference with the commerce of Acre, by way of the Brazilian rivers, would ensue. This action led Bolivia on July 10, 1902, to appeal for intervention to the United States on the ground that American interests were endangered. The United States government replied that, while tendering its good offices, it would not interfere between Brazil and Bolivia, but would ask for all reasonable concessions with regard to the Americans forming a part of the syndicate. In his message to the Bolivian congress, August 10, 1902, President Pando, speaking of the Acre matter, said: "The government is convinced that it has acted correctly in this affair, and within the scope of its authority as a sovereign nation. Its first and principal object was to promote, subject to the principles of universal legislation, the organization of a corporation capable of developing those desert and unhealthy territories and of establishing a stable and just government for the benefit of the inhabitants of the same, without the participation of any foreign government in the plan, as has been falsely asserted, and without the preconceived intention of establishing only an American company." The president also stated that the syndicate had deposited a guaranty of £5000 and had a period of one year in which to form a company.

From the commercial point of view the subject of contention was the immense rubber resources of the Acre region and other parts of northern Bolivia, and doubtless to no small extent the Brazilian government was actuated by the interests of the inhabitants of the Brazilian state of Amazonas. Many of these people, crossing over from Brazil, have made large profits in exploiting the Bolivian rubber

forests and shipping the product down the rivers to the Amazon. The Bolivian government (in 1902) has customs houses on two of these rivers; but, it is asserted, the Brazilians have shipped rubber down the other rivers and thus evaded export duties. The concession to the syndicate would probably result in the forcing of the Brazilians out of the country, and probably the syndicate would establish custom houses on the free rivers; hence the indignation of the people of Amazonas. The rubber shipped from the Acre River and its affluents amounts to about 3500 tons a year, and that from the other rivers to about 5000 tons. This product is of the first quality and is sold in Europe as Pará rubber.

During the last few years this little known and less developed part of South America has attracted considerable attention. In the summer of 1899, it will be remembered, a revolution was brought about among the Brazilians in Acre by a Spaniard named Galvez, who controlled the country until bought off, it is alleged, by the Brazilian government in the following December. At this time the so-called republic of Acre was set up, but its president, it is also alleged, was bought off by Bolivia just as Bolivian troops reached Puerto Alonso (August, 1900). In October, 1902, the Brazilians in Acre, apparently influenced by the syndicate concession, again revolted against Bolivian authority. To operate against them the government in November organized an expedition of some 2000 men, who, it was thought, could not reach their destination until early in 1903. The expedition was commanded by President Pando.

BOND, Sir ROBERT, premier of Newfoundland since 1900, took part in the conference of colonial premiers in London in July, 1902, and later in the year successfully negotiated a reciprocity treaty between Newfoundland and the United States, with Secretary of State Hay at Washington, which was signed on November 8. He was born on February 25, 1857, at St. John's, Newfoundland, where his father had been for many years a leading merchant. He was educated at Queen's College, Taunton, England, and returned to Newfoundland, where he studied law and was admitted to the bar, but instead of practising entered political life and in 1882 was elected to the Newfoundland colonial assembly. In 1884-85 he was chosen speaker of the assembly, and in 1886 became the parliamentary leader of his party. In 1889 he entered the cabinet of Sir William Whiteway as colonial secretary, retaining the office until 1897, except for a short interval in 1894, when he was unseated and disqualified. Since his assumption of the office of colonial secretary he has been a staunch champion of Newfoundland's rights, has continually opposed all attempts to bring about its incorporation with Canada, and has consistently advocated closer relations with the United States. In 1890 he went to England as a commissioner to readjust the "French Shore" treaty, and in the same year negotiated with James G. Blaine, at Washington, the treaty known as the "Blaine-Bond convention," which failed because of the opposition of Sir John McDonald. In 1892 he represented Newfoundland at the Halifax conference on fisheries, was chairman of the Newfoundland delegation at the Ottawa conference in 1895, and was a delegate to the conference on the French fisheries treaties in London in 1901.

BORAX. See MINERAL PRODUCTION.

BORNEO, an East Indian island, has an estimated area of nearly 300,000 square miles and an estimated population of about 1,900,000. The northern part is under British protection; the remainder, comprising over two-thirds of the total area, is a possession of the Netherlands.

Dutch Borneo has an estimated area of 212,737 square miles, and an estimated population, exclusive of several districts as yet unexplored, of about 1,181,000. The interior is not well known and is practically under the control of the natives.

British North Borneo, a protectorate in the northeastern part of the island, under the jurisdiction of the British North Borneo Company, has an estimated area of 31,106 square miles and an estimated population of 175,000. In 1902 the British governor was E. W. Birch (since 1900). For the fiscal year 1900 the revenue and expenditure amounted to 587,226 dollars (Mexican) and 398,152 dollars, respectively; for 1901, 613,141 dollars and 364,468 dollars, respectively. Various tropical and sub-tropical products are exported, of which the most important is tobacco. Imports and exports in 1900 were valued at 3,178,929 dollars and 3,336,621 dollars, respectively; in 1901, 3,262,263 and 3,382,387. About 110 miles of railway were under construction in 1902. In June the main line had been completed for 92 miles from Brunei Bay through the interior to Jesselton, on Gaya Bay, and about 100 miles of earthworks finished. The completion of this railway promises considerable development in the tobacco industry. The imports and exports of Labuan, a small British island off the northwest coast of Borneo, were valued in 1900 at 1,112,184 dollars, and 746,931 dollars, respectively; in 1901, 1,836,000 and 1,093,000, respectively.

Brunei, on the north coast, is under British protection, but internally is admin-

istered by a native sultan, Hassim Jalud Alam Akamadin, who succeeded in May, 1885. The chief export is sago, but there is little trade and the revenue is small.

Sarawak, a British protectorate on the north coast southwest of Brunei, has an estimated area of 50,000 square miles and an estimated population of 500,000. It is administered by Rajah Sir Charles Johnson Brooke, who succeeded his uncle, Rajah Sir James Brooke, in June, 1868. Revenue and expenditure in 1900 amounted to 915,966 dollars (Mexican) and 901,172 dollars, respectively; in 1901, 1,064,318 and 953,818, respectively. The leading exports are pepper, sago, flour, gutta-percha, gold, and rubber. Imports and exports in 1900 were valued at 3,848,679 dollars and 5,217,036 dollars, respectively; in 1901, 4,404,644 and 5,900,925, respectively.

BOSNIA AND HERZEGOVINA, lying south of Hungary between Dalmatia and Servia, although nominally provinces of the Ottoman empire, have been since the Treaty of Berlin (1878) occupied and administered by Austria-Hungary. The total area including the sanjak of Novi-Bazar, which is occupied by an Austrian force although under Turkish civil administrators, is 23,571 square miles. The population in 1895 was 1,568,092. The army of occupation nominally numbers about 23,000. Sarajevo, with a population of 38,083, is the capital and largest city. The inhabitants are largely Croats and Servians. Adherents of the Orthodox Greek Church numbered 673,246 in 1895, of Mohammedanism 548,632, and of the Roman Catholic Church 334,142. The administration of the provinces is entrusted to the Austro-Hungarian minister of finance and exercised by him through a local provincial government. The revenue was estimated in the budget of 1902 at 44,846,281 kronen and the expenditure at 44,582,206 kronen. The krone is worth 20.3 cents. Although the country is largely agricultural, farming methods are old-fashioned and the productivity underdeveloped. The chief agricultural products are tobacco, a government monopoly, the output of which amounted to 3600 tons in 1900; cereals and dried fruits, of which 17,000 tons, valued at £210,000, were exported in 1900. The exports of cattle in 1900 were valued at £210,000. There are iron, coal, copper, quick-silver, and manganese mines, operated chiefly by the government. The output of coal in 1900 was 394,516 tons, and of iron 133,454 tons. There are no separate trade statistics, the provinces being incorporated in the Austro-Hungarian customs union. In 1901 there were 628 miles of railways in operation. In addition to a large number of sectarian schools, there is a graded system of government schools, including gymnasia in which education is free but not compulsory.

BOSTON PUBLIC LIBRARY, Boston, Mass., leads the libraries of the United States in circulation. During 1902 it issued for home use about 434,000 volumes from the central library on Copley Square, and about 1,050,000 volumes from the branch libraries, representing an increase in circulation over the previous year of about 160,000 volumes. At the end of 1902 the library contained about 835,000 volumes; some 72,000 persons held borrower's cards, over 50,000 drawing from the branch libraries. There are ten branch libraries and twenty-one delivery stations, thirteen of which have a collection of periodicals and reference books. Deposits of books are sent to 72 schools, 36 engine houses and 16 institutions. There were no notable gifts during 1902. Mr. Horace G. Wadlin is librarian in place of Mr. James L. Whitney, now chief of the statistical department.

BOTANICAL SOCIETY OF AMERICA, a national scientific society organized in 1893 as an outgrowth of the Botanical Club of the American Association for the Advancement of Science. At the ninth annual meeting held in Washington, D. C., December 30, 1902, the society passed a resolution to set aside from its income every year the sum of \$500, to be used in making grants in aid of scientific investigations. An amended constitution was adopted. President, Charles Reid Barnes, University of Chicago; secretary, Dr. D. T. MacDougall, New York Botanical Society, Bronx Park, New York City.

BOURINOT, Sir JOHN GEORGE, clerk of the Canadian House of Commons, died at Ottawa, October 13, 1902. He was born in Sydney, N. S., October 24, 1837, the son of a former Canadian minister, Hon. J. Bourinot. After studying in Trinity College, Toronto, and in Nova Scotia, he entered journalism as parliamentary reporter for various Canadian newspapers, and was for many years the editor of the *Halifax Reporter*, which he established in 1860. In 1880 he became clerk of the Dominion House of Commons, and by many books, and contributions to magazines, won recognition as an authority upon the constitutional history and parliamentary practice of Canada. He was a prominent member of the Royal Society of Canada, of which he had been president, and after 1882 was honorary secretary. His best-known works are: *Canada* (in "Story of the Nations" series), *Parliamentary Procedure and Government in Canada*; *How Canada Is Governed*; and *Cape Breton and Its Memorials of the French Régime*.

BOURKE, ROBERT, first Baron Connemara, a British statesman, died in London, September 3, 1902. He was born at Hayes, County Meath, Ireland, June 11, 1827,

was educated at Trinity College, Dublin, and was called to the English bar in 1852. In 1868 he was elected a Conservative member of the House of Commons for Lynn Regis, and sat for that borough eight years. Disraeli, always on the lookout for promising subordinates, made him under secretary of state for foreign affairs in his administration in 1874. After the defeat of Disraeli's ministry (1880), Bourke was sent as a commissioner to settle the terms of Turkey's foreign debt, and in 1885, after the defeat of Mr. Gladstone's administration, he was again appointed under secretary for foreign affairs. During 1887-91 he was governor of Madras. In 1887 he was raised to the peerage as a reward for official service.

BOWDOIN COLLEGE, Brunswick, Me., founded 1794. The college had in 1902 an attendance of 391, excluding names counted twice, 275 in the academic department and 124 in the medical school, an increase over 1901 of about 20 in each department. The faculty numbers 40. The endowment was increased about \$73,000 by the receipt of gifts. The most noteworthy change in the college was the completion of the new Hubbard Hall, a building which is to be devoted to the use of the library for books, for general reading rooms, and for conference rooms for students, and also for some of the administrative departments of the college. The library, which is excellently adapted to its purposes, was built at a cost of \$300,000 by Gen. Thomas H. Hubbard, of New York. It will be ready for occupancy in May, 1903. A large amount of money has recently been invested in college buildings by friends of the institution and its faculty and endowment have been doubled in the last ten years. The curriculum has been greatly enriched in the matter of electives. The gross income for 1900 was \$60,745. The library contains 73,195 bound volumes. President, W. D. Hyde, D.D.

BOWEN, HERBERT WOLCOTT, United States minister to Venezuela since 1901, became a prominent figure in international affairs in the closing weeks of 1902 by reason of his participation in the negotiations between Venezuela and the allied powers (Great Britain, Germany, and Italy). He was born in Brooklyn, N. Y., February 29, 1856, the son of Henry C. Bowen, editor and founder of the *Independent*, and Lucy Tappan Bowen, daughter of Lewis Tappan, merchant and abolitionist. He was educated in the Woodstock (Conn.) Academy, and at the Brooklyn Polytechnic Institute, and after spending two years traveling with a tutor in Europe, returned to America and entered Yale University with the class of 1878, of which William H. Taft, governor of the Philippines, and William H. Hunt, governor of Porto Rico, were members. Leaving before graduation, he passed a year in Italy, and then returned to enter Columbia Law School, where he graduated *cum laude* in 1881. In the same year he was admitted to the bar. He practised law in New York City until 1890, when he was appointed by President Harrison United States consul at Barcelona, Spain. From that time he has been continuously in the service of the State Department. In 1895 he was promoted by President Cleveland consul-general at Barcelona. Here he remained until April, 1898, being for several weeks previous to the outbreak of hostilities against the United States in constant danger of assassination. He stayed in Barcelona until the day after the declaration of war, and was the last American official to leave the country. After the conclusion of peace, when he was on the point of returning to Barcelona, President McKinley appointed him minister-resident to Persia, to succeed his brother-in-law, Arthur Sherburne Hardy. In Persia he received marked expressions of regard from the Shah, and before he left his rank had been changed to that of envoy extraordinary and minister plenipotentiary. In June, 1901, President McKinley transferred him to the post of minister to Venezuela to succeed Francis B. Loomis, who had become *persona non grata* to the Venezuelan government because of his action in the asphalt controversy. At Caracas he was able to render services of great value because of his having completely won the confidence of President Castro. He is the author of several books of verse, and of an *International Law* (1898). See VENEZUELA (paragraphs on History).

BOWLING. The second annual tournament of the American Bowling Congress, which is now considered the authoritative body in this sport, was held at Buffalo, N. Y., January 20-24, 1902. The individual championship was won by F. Strong, Chicago, with 649 pins for three games. J. Koster, New York, was second with 647 pins, and J. Berlin, of Chicago, third, with 643. The two-men team championship went to McLain and Steers, Chicago, 1237 pins for three games. Dysinger and Krug, of Los Angeles, were second with 1220, and Elwert and Funke, Belleville, Ind., third, with 1169. The five-men team championship was won by the Fidelia team of New York City, with 2792 pins for three games. The second team was the National of New York, with 2782 pins, and the third the Rosedale, also of New York, with 2724. In September, 1902, the New York Bowling Association was formed for the purpose of governing the game in the greater city.

BOXING. The winners of the championship boxing contests of the Amateur

Athletic Union held during 1902 were as follows: One hundred and five pounds, W. Schumaker; 115 pounds, Fred. Berg; 125 pounds, Joe McCann; 135 pounds, J. Dillon; 145 pounds, Charles McCann; 158 pounds, William Rodenbach; heavy-weight, Emery Payne. In pugilism, James Jeffries retained the championship of the world by knocking out Robert Fitzsimmons in the eighth round on July 25, 1902, at San Francisco. The bantam-weight championship was won by Harry Forbes at St. Louis, Mo., January 23, who defeated Dan Dougherty in four rounds; and the light-weight championship by Joe Gans who defeated Frank Erne in one round at Fort Erie, Ontario, May 12.

BOYNTON, JAMES STODDARD, thirty-third governor of Georgia, died December 22, 1902. He was born May 7, 1833, in Henry County, Ga., where he was admitted to the bar in 1852. He settled in Monticello, removed to Jackson in 1858, and was elected ordinary of Butts County in 1860. At the outbreak of the Civil War he entered the Confederate service as a private, and later rose to the rank of colonel of the Thirtieth Georgia infantry. After the war he resumed his legal practice at Griffin, Ga., of which he became mayor in 1869. He was president of the State senate from 1880 to 1884, and acting-governor after the death of Alexander H. Stevens in 1883. In 1886 and 1890 he was elected judge of the superior court of Georgia, and in 1893 resigned to become division counsel of the Central Georgia Railroad, which office he held until the time of his death.

BRAZIL, the largest republic in the world except the United States, occupies the central and eastern part of South America. The capital is Rio de Janeiro.

Area and Population.—The area of Brazil has been estimated at about 3,218,000 square miles. In 1902 announcement was made that the Bolivian boundary between the Madeira and Javari rivers had been determined; this settlement decreased Brazil's area by many thousand square miles. According to the census of 1890 the population was 14,333,915. In 1900 a census was taken, but its results, showing a decrease in population, were not believed to be accurate and so were not adopted. According to a statement published in 1902 by the statistical bureau of the state of São Paulo, the population in 1900 was 21,565,000, distributed as follows:

Minas Geraes	4,277,000	Alagoas ..	781,000	Rio Grande do Norte.....	407,000
Bahia.....	3,335,000	Federal District.....	750,000	Santa Catharina.....	405,000
São Paulo.....	2,520,000	Maranhão.....	660,000	Paraná.....	380,000
Pernambuco.....	2,089,000	Pará.....	652,000	Goyaz.....	340,000
Rio Grande do Sul.....	1,850,000	Parahyba.....	596,000	Amazonas.....	240,000
Rio de Janeiro.....	1,800,000	Sergipe.....	450,000	Espírito Santo.....	201,000
Ceara.....	1,000,000	Piauí.....	425,000	Matto Grosso.....	157,000

The prevailing religion is Roman Catholicism. Education, which is nowhere compulsory, is in a very backward condition.

Government.—The executive authority is vested in a president, who is assisted by a cabinet of six members who are appointed by and responsible to himself. The president for the four-year term ending November 15, 1902, was Senhor M. F. de Campos Salles; he was succeeded by Senhor Francisco de Paula Rodrigues Alves. The national legislative body is a congress of two houses, the senate and the chamber of deputies. The several states enjoy local self-government.

The active army numbers about 15,000 officers and men. The navy is reported to comprise 2 third-class battleships, 2 second-class cruisers, 2 third-class cruisers, 3 torpedo cruisers, 8 first-class torpedo boats, and a number of smaller or older craft.

Finance.—The monetary standard is gold and the unit of value the milreis, worth 54.6 cents; the value of the paper milreis in 1902 was about 24 cents. The chief source of revenue is duties on imports and the largest items of expenditure are for the departments of finance and public works. The estimated revenue and expenditure have been reported in milreis as follows:

	Revenue.		Expenditure.	
	Gold.	Paper	Gold.	Paper.
1800	53,975,543	312,958,000	36,973,646	263,162,276
1901	58,870,641	286,092,200	37,510,000	244,514,000
1902	42,876,667	257,461,000	33,555,000	224,515,000
1903	43,123,942	255,643,000	42,593,070	236,489,192

In his last message to congress, May 3, 1902, President Campos Salles contrasted the financial condition of the government at the time he assumed office, November 15, 1898, with its condition in 1902. At the earlier date gold payments were suspended; paper money in circulation amounted to 788,364,000 milreis, with the milreis worth about 14.55 cents; Brazilian bonds were at 50 per cent. discount; the amount needed for redemption of the funding loan was 115,997,000 milreis; the amount due

on the 1897 loan was £1,122,083; £274,694 were due for war material; the treasury owed 11,000,000 milreis to the Bank of the Republic; and treasury notes amounting to 20,350,000 milreis were in circulation. Against this indebtedness there were only 5,500,000 milreis in the treasury and £81,713 in the London agency. Gold payments on the foreign debt had been resumed in July, 1901; the paper circulation at the time of the message had been reduced to about 681,000,000 milreis, while the value of the milreis had risen to about 24.28 cents; Brazilian bonds were worth about 85, all the treasury notes had been withdrawn, and the 1897 loan had been paid; at the existing rate of exchange there was a surplus of about 80,000,000 milreis currency. In 1902 the government was still endeavoring to increase the value of the paper milreis by providing, through the 25 per cent. of customs collected in gold, for the prompt gold payment of interest on the public debt and by reducing the amount of paper money in circulation. Any advance in the value of the paper milreis means an increase in the actual value of the customs receipts. The government is trying to improve its finances also by buying railways, on which it had guaranteed interest charges, and leasing them at an advantage, and by curtailing expenses and imposing additional taxation. Throughout 1902 financial and industrial conditions, though improved, as shown by the president's report, nevertheless continued unsatisfactory.

The national debt, at the beginning of 1901, is stated as follows: Foreign consolidated, 394,686,449 milreis; internal consolidated (gold), 27,259,000 milreis; total gold debt, 421,945,449 milreis (\$230,382,215). The paper debt amounted to 1,398,403,972 milreis, composed as follows: Internal consolidated, 543,826,637 milreis; floating, 165,577,335 milreis; paper currency, 689,000,000 milreis.

Industries and Commerce.—The principal industry is agriculture, though only a small part of Brazil's area, is under cultivation. The leading product is coffee, while others of importance are rubber, sugar, tobacco, maize, yerba maté, cotton, cacao, beans, and nuts. In the coast districts factories, especially for the production of cotton goods, flour, and alcoholic beverages, are increasing. The estimated coffee production for the year ending June 30, 1902, was 16,000,000 bags of 60 kilogrammes (132¼ pounds); of these 10,149,327 were received at Santos, and 4,971,686 at Rio de Janeiro. In recent years the fall in coffee prices, consequent upon overproduction, has been one of the most disturbing factors in Brazil's economic condition. At a meeting of the Agricultural Society of São Paulo, held in July, 1902, resolutions were adopted looking toward the relief of the coffee industry, including temporary restriction of the area planted to coffee, prohibition of the exportation of inferior coffee, and negotiation of commercial treaties reducing import duties on coffee. Rubber is the most important product of the Amazon Valley; for years ending June 30, the export has been: 1900, 26,881 tons; 1901, 27,680 tons; 1902, 29,997 tons. Of this last amount 15,931 tons went to Europe and 14,066 tons to the United States; 14,668 tons came from Manaus, 13,925 from Pará, and 1404 from Iquitos (Peru). Mining is little developed, though gold and diamonds are produced to a considerable extent; from the state of Minas Geraes 4,012,221 grammes of gold were exported in 1901.

The principal imports include cotton and woolen goods, iron and steel goods, provisions, alcoholic liquors, and coal. Among the leading exports, besides those mentioned above, are sugar, cotton, tobacco, and cacao. The currency values of imports and exports, exclusive of specie, in 1897 were 671,603,280 milreis and 831,806,918 milreis respectively; in 1901, according to the *Serviço de Estatística Commercial* of Rio de Janeiro, imports amounted to 415,053,516 milreis (about \$95,462,000), and exports 860,826,969 milreis (about \$197,990,000). Commerce by countries of greatest trade importance is reported in milreis (paper) as follows for 1901:

COUNTRIES.	Imports from	Exports to	COUNTRIES.	Imports from	Exports to
Great Britain and possessions.....	180,278,411	111,487,400	Germany.....	39,080,806	126,748,284
Argentina.....	56,178,430	18,218,773	France.....	33,263,299	100,338,297
United States.....	51,635,665	371,147,265	Uruguay.....	27,086,441	9,969,667
			Portugal.....	26,928,540	5,061,289

In 1900 there were 9172 miles of railway in operation and 14,893 miles of telegraph line, with 27,721 miles of wire. Of the telegraph lines the government owned 12,769 miles, with 25,318 miles of wire.

History.—On March 1, 1902, Senhor Francisco de Paula Rodrigues Alves and Senhor Silviano Brandão, as candidates of the Republican party, were elected president and vice-president, respectively. Senhor Alves was inaugurated November 15, 1902; Senhor Brandão died in the preceding month. The new president, who was governor of São Paulo and had been a federal senator and minister of finance, is

regarded as an able financier. He announced that in general he would adopt the policies of his predecessor. His cabinet, which came into power with him and which inspired general confidence, comprised: Senhor Rio Branco, minister for foreign affairs; Senhor Seabra, justice and the interior; Senhor Bulhoes, finance; Field-Marshal Argollo, war; Admiral de Noronha, navy; Senhor Mueller, communications, public works, and education. On the occasion of the departure of the retiring president, Senhor Campos Salles, from the capital on November 15, riotous demonstrations took place against him and against some of the newspaper offices. Troops charged the rioters, with the result that one person was killed and several others injured, and numerous arrests were made.

The treaty referring the question of the boundary between Brazil and British Guiana to the arbitration of the king of Italy and signed by Lord Lansdowne, British foreign minister, and Senhor Joaquin Nabuco, Brazilian minister at London, on November 6, 1901, was proclaimed January 28, 1902. The territory in dispute is bounded on the west by the Cotinga and Takutú rivers, which are confluent, and on the east by the Rupununi River; the northern limit is the watershed running eastward from the source of the Cotinga to a point near Mount Ayangcanna, and the southern limit the line connecting the source of the Rupununi with that of the Takutú.

For a number of years the large German populations in the extreme southern states, Rio Grande do Sul, Santa Catharina, and Paraná, have called forth much comment, of which the general purport is that they are destined to break away from Portuguese rule. Discussion continued in 1902, and was made especially prominent by the German colonial conference, convened in Berlin on October 10. Although the German government officially disclaimed any desire of acquiring territory in Brazil, it made no effort to check at the conference this sentiment voiced virtually by Dr. Robert Jannasch, the well-known geographer and commercial expert, and approved by many of his associates and a large part of the German press. It was urged that German emigration be directed to southern Brazil, apparently in the hope that the Germanized territory would declare itself a colony of the empire or a republic in strict alliance therewith. The former suggestion was regarded by many American supporters of the Monroe doctrine as purely visionary, and indeed in 1902 there was a tendency in the United States to treat with lessening seriousness the question of the "German peril" in Brazil; at the end of the year, however, the Venezuelan imbroglio evoked considerable discussion of Emperor William's alleged designs upon South America. And it should not be overlooked that through the medium of steamship lines, railways, banks, factories, and other enterprises, Germany is not failing to take advantage of her commercial opportunities in southern Brazil.

BRETT, JOHN, an English seascape painter, died at Putney, England, January 7, 1902. He was born in 1831, and from 1856 to 1901 contributed one or more pictures to every exhibition of the Royal Academy. His early work, especially "The Stone-breaker" (1858), was warmly admired by Ruskin for its brilliant coloring and delicate finish—characteristics of the majority of his pictures. The most admired now of his paintings are views among the Cornwall and Channel Islands. Some of his better known pictures are: "Spires of Channel Islands" (1875); "Cornish Lions" (1877); "Carnarvon Bay" (1878); "Britannia's Realm, Sandy Shallows of Seashore" (1880); "Yellow Sands, Welsh Dragons" (1883). In 1881 he was elected an associate of the Royal Academy.

BRIDGE BUILDING. The building of new bridges to replace those that have become too light for modern heavy traffic and for the purpose of opening up new routes for transportation goes on so ceaselessly that one year possesses little more of note than another in this regard. In several respects, however, the year 1902 was a notable one even when compared with the remarkable records of preceding years. In the United States particularly the number of bridges of the first rank in size and importance which were projected or under construction during the year was unusually large. The greater number of these structures were designed for railway purposes, but a few, and these including the very largest, were for street traffic. An enumeration of these structures shows examples of about every type of bridge that engineers now recognize as good practice.

In *suspension bridge* construction the two great 1600-foot span structures now in process of construction across the East River, New York City, easily rank at the head. The older of these two bridges, formerly known as the New East River Bridge, was officially renamed the Williamsburg Bridge during the year, and at the same time the younger was named the Manhattan Bridge. The principal work done on the Williamsburg Bridge during 1902 was the spinning of the four steel wire suspension cables, and the close of the year would undoubtedly have witnessed the practical completion of this work had it not been for the untoward accident of fire which occurred at the top of the Manhattan tower on November 11, 1902, and which

damaged two of the cables so much that quite extensive repairs were rendered necessary. Each of the four cables of this bridge is composed of 7,696 steel wires 3-16 inch in diameter. These wires are grouped in strands, there being 208 wires in each strand and 37 strands for each cable. In construction each strand was laid up as one continuous wire looped around two end pins just as a skein of yarn would be looped on the hands held apart. When all the strands were completed they were bunched together into a cylinder and held in that position by circular steel clamps which carry the suspender ropes. To permit of this work a pair of suspension foot bridges, one under each pair of main cables, was built between the two towers. At the time of the fire the spinning of all four cables had been completed and the suspender clamps were in place. Work had also been begun in placing the protective coating and the steel jackets designed to shield the cable wires from the weather. The fire occurred on the Manhattan tower just where the cables bend over the tower saddles, and resulted from the ignition of the timber shanties and other combustible materials used by the contractors at that point. It swept over the two southernmost cables heating and weakening the exposed wires. In one cable 500 wires were injured, and in the other 200 wires. Tests made on the injured wires showed that a loss of strength and elasticity had resulted, which made one cable $2\frac{1}{2}$ per cent. weaker, and the other $6\frac{1}{2}$ per cent. weaker than before the fire. To repair these damages the engineers proposed to cut out the injured portions of the wires and to splice in new pieces of wire. By doing this it was estimated that one cable would be only 0.25 per cent. weaker and the other only $2\frac{1}{2}$ per cent. weaker than the original strength, and to make up this it was proposed to reinforce the cables by adding new wires. As repaired, it is estimated that the cables will be quite as strong as they were originally. Perhaps the most novel feature of the cable construction for the Williamsburg Bridge and the feature that distinguishes it from previous cable building, was that of using a cloth wrapping and steel jacket to protect the cable from the weather. In previous parallel wire suspension cables the wrapping has consisted of fine wire wound tightly around the cable, like thread on a spool, and then painted. Besides the cable work, there was steady progress during 1902 on the construction of the approaches and contracts were let for the construction of the suspension span. The work on the Manhattan Bridge during 1902 was confined to the foundations for the Brooklyn tower, but contracts were let for constructing the Manhattan tower foundations. This last foundation will consist of a timber caisson 78 x 144 feet in lateral dimensions, which is to be sunk by the compressed air process. The Brooklyn tower caisson was of substantially the same dimensions. Probably the most notable announcement made during the year in connection with this work was that of Mr. Gustav Lindenthal, commissioner of bridges, of New York City, that suspension cables of forged steel eye-bars would be employed. While this was a common form of cable construction in early suspension bridges, it has never before been proposed for a span of so great a length as 1,600 feet.

For very long spans the *cantilever bridge* is the only type of bridge that is in any sense a rival of the suspension bridge, and the year 1902 saw a number of structures of the cantilever type in process of construction. The most notable of these, in all respects, was the 1,800-foot span in process of construction over the St. Lawrence River about $6\frac{1}{2}$ miles upstream from Quebec, Canada. The river at the point where the bridge will cross it is 1,900 feet wide at low tide and 2,000 feet wide at high tide. The maximum depth of water in the channel is 180 feet, but the river shallows rapidly toward the banks, so that at the points where the two main piers are built, 1,800 feet apart, it is only 10 feet deep at low tide. Besides the 1,800-foot centre span there are a 500-foot and a 210-foot span on each side of the river. The bridge will carry a double-track railway between the main trusses $62\frac{1}{2}$ feet apart, and a trolley track and roadway outside of these trusses on each side of the bridge. The depth of the main trusses at the centre is 120 feet, and at the piers is 339 feet. In considering these figures it will perhaps aid to a full understanding of their significance if we remember that the main spans of the Forth Bridge in Scotland, hitherto the giant among bridge structures, are 1,710 feet long, or 90 feet shorter than the span of the Quebec Bridge. The Forth Bridge, however, has two spans of the great dimension stated, and is exactly 2,030 feet longer from end to end than its Canadian rival. At the end of 1902 the foundation structure for the Quebec Bridge was practically completed. It is, perhaps, of interest to note here, also, that the superstructure for this giant structure is to be built by a United States firm, the Phoenix Bridge Company, of Phoenixville, Pa. Another Canadian bridge enterprise of great magnitude is the proposed bridge across the Straits of Canso between Port Hastings and Cape Porcupine, Nova Scotia. The general plans prepared during 1902, call for a double-track railway cantilever bridge of 1,800 feet clear span. In the United States there were four cantilever bridges of unusual spans approaching completion at the end of 1902. All but one of these were railway bridges and two of them were being built by one company, the Wabash Railroad, on the new extension of its line to

LUXEMBOURG BRIDGE

Courtesy, Engineering News

Pittsburg, Pa. The longer of these two bridges crosses the Monongahela River at Pittsburg, and is 1,504 feet long from end to end, and has an 800-foot main span; the shorter crosses the Ohio River, at Mingo Junction, O., and has a 700-foot centre span and two end spans each 298¼ feet long. In total length, both of these bridges are exceeded by the 2,750-foot bridge over the Mississippi River at Thebes, Ill., but the longest clear span of the Thebes Bridge is only 671 feet. The fourth bridge of the number mentioned above is a highway bridge across the Ohio River at Marietta, O., which has a main span of 650 feet. Besides the four bridges which were drawing toward completion at the end of 1902, there remains to be mentioned the cantilever bridge designed to cross the East River at Blackwell's Island, New York City. This structure is designed to have a main span of 1,131 feet, and during the year work was in active progress on the foundations.

The most notable bridges of the *braced girder* type included in the work of 1902 were the Pennsylvania Railroad Bridge across the Allegheny River at Pittsburg, Pa., and the combination highway and electric railway bridge over the Missouri River at St. Charles, Mo. The St. Charles Bridge consists of four spans of the following lengths: 417 feet 7½ inches; 419¼ feet (two), and 301 feet 7½ inches. The Pennsylvania Railroad Bridge is a four-track, double-deck bridge with four lines of girders and a main span 337½ feet long. In India, the Godavari Bridge on the East Coast Railway, and notable chiefly because of its great length, was completed early in 1902. This bridge has fifty 150-foot braced girder spans, and a total length of 9,096 feet. A highway bridge having two channel spans of 380 feet each was also built across the Mississippi River at Dubuque, Ia., in 1902. Except for the fact that this structure adds another to the list of bridges crossing the Mississippi River it is of no particular importance.

In *steel arch bridge* construction the most notable work of the year 1902, was furnished by the republic of Costa Rica in the Rio Grande Bridge crossing the river of that name about 26 miles west of San José on the line of the Pacific Railway. This was a two-hinged braced arch structure of 450 feet span and was built by an American firm. In the United States several arch spans were included in the year's steel bridge construction, but they were all of comparatively short span. Among these the two following perhaps deserve to be noted: A three-hinged arch of 207 feet span over the Menominee River on the Chicago, Milwaukee and St. Paul Railway, near Iron Mountain, Mich.; a three-hinged spandrel braced arch bridge of two 164-foot spans on the Cleveland, Elyria and Western Railway (electric), near Birmingham, Ohio. In France, the Viar Viaduct was formally completed during 1902, although its construction more properly belongs to the records of previous years. This is a three-hinged steel arch of 721 feet span.

In *drawbridge* construction the most notable enterprise of 1902 was the beginning of work on a 520-foot swing span across the Missouri River at Omaha, Neb. Some ten years ago a swing span of the same length was erected at this point and connected by temporary structures with the shore on each side of the river. When the first swing span was erected it was intended at some future time to replace its temporary shore connections with a permanent structure and this work was begun in 1902. The novelty of the project consists in constructing a second swing span end to end with the first. The purpose of this unusual plan was to cover the full width of the river by the swing spans so that no shifting of the channel would shut off navigation. The new span is much heavier than the old one, and several of its details are novel. No swing bridge span of greater length than 520 feet has ever been built. Several *bascule* bridges were included in the work of 1902, but none of unusual length of span. There was also built at Duluth, Minn., a ferry bridge, consisting of two high towers, the tops of which are connected by a braced girder span. This span serves as a track for a carriage from which a platform or car is hung at the level of the streets approaching the bridge. This carriage with its car is moved back and forth along its track and thus carries the car to and fro between the river banks. The span of the bridge is 393¼ feet. Similar bridges have been built at a number of places in Europe, but this is the first to be constructed in the United States.

In *masonry arch bridges* built during 1902, lead is taken by the great 277-foot stone arch at Luxemburg, which was drawing toward completion as the year closed. No other stone arch bridge work undertaken during 1902 was of unusual character. In *concrete-steel* construction the most striking example of the year was the so-called Y-Bridge at Zanesville, Ohio. In plan, this bridge has the form of a letter Y. It has eight spans, three of 81 feet, one of 99 feet, one of 120.6 feet, and three of 122 feet. Each span is an arch of concrete embedding a metal skeleton.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

See ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE.

BRITISH CENTRAL AFRICA, a large territory in southern central Africa, extending from the Zambesi northward to Lake Tanganyika, is administered, with the

exception of the British Central Africa Protectorate, by the British South Africa Company, under the name of Northern Rhodesia. See the following article, RHODESIA, and CAPE-TO-CAIRO RAILWAY.

BRITISH CENTRAL AFRICA PROTECTORATE, formerly known as Nyassaland, and lying between Lake Nyassa and Northern Rhodesia, has an estimated area of 42,217 square miles and an estimated population of about 900,000. The protectorate is administered by an imperial commissioner, Mr. Alfred Sharpe, resident at Zomba. In 1902 a high court was established by an order in council in and for the protectorate. Revenue and expenditure in the fiscal year 1901 amounted to £49,215 and £78,366 respectively. The principal export is coffee, but sugar, cinchona, tobacco, and other products are also cultivated. Imports and exports were valued in the fiscal year at £146,063 and £38,723 respectively; in 1902, £135,842 and £21,739 respectively. There is a considerable transit trade. It is expected that a railway, for the construction of which a contract was made in November, 1901, will connect Blantyre with Chiromo by the end of 1903.

BRITISH COLUMBIA, a province of Canada, has an area of 383,300 square miles and a population of 178,657, according to the census of 1901, as compared with 98,173 in 1891, showing 81 per cent. increase, the largest of any Canadian province. Capital, Victoria, with a population of 20,821 in 1901, as against 3,980 in 1891. The public-school system is free and undenominational. In 1901 there was a total enrollment of 23,615 pupils; the teachers numbered 528.

Government and Finance.—A lieutenant-governor, aided by a responsible cabinet, administers the province. There is one legislative chamber of 38 members elected by manhood suffrage. British Columbia has 3 members in the Dominion senate and 7 in the house of commons. The finances of the province do not seem to be in a very prosperous condition. The revenue for the year ending June 30, 1901, was \$1,605,920, and the total expenditure \$2,407,492—a gross deficit of \$801,572, and, with a deduction for sinking fund investment and loan redemption, a net deficit of \$681,901. The chief sources of revenue were, in addition to \$242,689 received from the Dominion, general mining receipts, \$154,270; free miners' certificates, \$93,510; revenue tax, \$101,196; real property tax, \$121,707. The chief items of expenditure were interest on public debt, \$255,393; civil government, \$232,013; education, \$313,507; public works, \$754,637. The total assets of the province for the fiscal year 1901 were \$3,377,140, and the total liabilities \$9,827,605.

Industries and Commerce.—Mining is the chief industry of the province. The total value of the mineral output for the calendar year 1901 was \$20,086,780, as compared with \$16,344,751 for 1900. The chief minerals produced were gold, \$5,318,703; silver, \$2,884,745; lead, \$2,002,733; copper, \$4,446,963; coal, \$4,380,993; and coke, \$635,405. British Columbia ranks next to Nova Scotia in the value of its fisheries. The trade of the province in the fiscal year 1902 was less than in the preceding year, the exports being \$18,385,335, as compared with \$21,648,191 in 1901, and the imports \$10,391,256, as compared with \$11,137,438 in 1901.

History.—In January, 1902, Premier James Dunsmuir, preparatory to appealing to the province in a general election, declared his policy to be chiefly a demand for more subsidizing of railways by the Dominion. The provincial legislature was opened on February 20, and it was announced officially that a railway would be subsidized from Yellowhead Pass, on the eastern boundary of the province, to Bute Inlet, on the Pacific Coast, there to be connected with the Vancouver Island Railway. The chief questions that agitated the province after the legislative session were the bad financial conditions of the province, the increase of the public debt, which is now \$6,407,757, and whether better terms could be secured from the Dominion government. The disallowance of anti-Japanese legislation was effective in inducing the province to modify the provisions against Japanese immigrants, and the treaty of alliance between Great Britain and Japan was instrumental in securing this result. Fourteen railway charters containing provisions hostile to the Japanese were changed. Some of the mines were closed during the summer by reason of strikes, but they were subsequently opened. At the general elections the Dunsmuir government was defeated, and Mr. E. G. Prior became premier. He announced a vigorous policy of railway building, the object being to construct a line from the Pacific Coast to join at Yellowhead Pass on the eastern boundary of the province, the Canadian Northern Company's line now being built from Lake Superior.

BRITISH EAST AFRICA. See EAST AFRICA, BRITISH.

BRITISH GUIANA, a colony of Great Britain on the northeastern coast of South America, has an estimated area of 120,000 square miles. The estimated population at the beginning of 1901 was 294,943, of whom the majority were negroes and East Indians. Immigration of the latter continues, the number for the year 1900-01 being 4,470. The capital is Georgetown. The colony is administered by a governor (Sir James Alexander Swettenham, since 1901), who is assisted by an executive

council and committees (courts) of appointed and elected members. For 1901 the revenue and expenditure amounted to £509,950 and £505,542 respectively; for 1902, £531,506 and £522,631 respectively. The public debt in 1902 amounted to £922,120. The principal product is sugar, but of late increasing interest has been shown in the cultivation of other crops. Land grants in the fiscal year 1900 aggregated 10,925 acres, and in 1901 11,314 acres. In the fiscal year 1901 the imports and exports were valued at £1,393,529 and £2,068,466 respectively; in 1902, £1,414,769 and £1,833,624 respectively. The leading export is sugar. Gold production in the fiscal year 1901 yielded £393,083, and in 1902 £371,492. About half of the total trade is with Great Britain and about two-fifths with the United States. There are about 94 miles of railway.

BRITISH HONDURAS, or BELIZE, a crown colony of Great Britain lying east of Guatemala on the Caribbean Sea, has an area of 7,562 square miles. According to the enumeration of 1901, the population was 37,479. The capital is Belize. The colony is administered by a governor (Sir David Wilson, since 1897), assisted by an executive and a legislative council. Revenue and expenditure in 1900 were £289,728 and £246,201 respectively; in 1901, £277,038 and £249,326 respectively. Imports and exports in 1900 were valued at \$1,198,772 and \$1,300,565; in 1901, \$1,227,202 and \$1,387,598. Included in these exports was a value of \$323,405 in transit in 1900 and \$493,430 in 1901.

British Honduras was the only British colony in which the coronation festivities planned for June, 1902, were carried out. Through the lack of cable service, news of King Edward's illness did not reach the colony until after the date set for the coronation. This incident called attention to the small progress the colony has made. There is no railway, telegraph, telephone, cable, or, outside of the capital, even a cartroad. It is stated that the efforts of the inhabitants to construct a railway from Belize to the Guatemalan frontier, through a practically flat country, by providing £75,000 and making a land grant of 200,000 acres, are blocked by the crown agents for the colonies, who want to undertake it themselves at a cost of £700,000, a sum which the merchants and colonists cannot meet.

BRITISH NORTH BORNEO. See BORNEO.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES, organized in 1824 as the Brooklyn Apprentices' Free Library, was re-incorporated in 1843 under its present title. In 1890 the charter was amended. The lectures delivered on the arts and sciences in connection with the institute's twenty-eight departments during 1902 exceeded 500 in number, and in addition there were instructive conferences, concerts, dramatic readings, etc. Work on the museum building, which has been in progress for some time, was materially advanced during that year, when a contract for interior work, amounting to \$274,500, was awarded by the city park department. The city board of estimate and apportionment also authorized the expenditure of \$150,000 for the erection of a power-house and power-plant equipment for the museum. The presentations made to the institute in 1902 were numerous, the money donations alone amounting to over \$80,000. During 1902 the total attendance at the lectures, exhibitions, exercises, etc., was 452,803; the total income, \$146,077.52. The institute issues a comprehensive and instructive *Year Book*. President of the board of trustees, A. Augustus Healy; secretary, George C. Brackett, 502 Fulton Street, Brooklyn.

BROOKS, ELDRIDGE STREETER, an American author, died January 7, 1902, at Somerville, Mass. He was born April 14, 1846, in Lowell, Mass., and studied at the Free Academy, now the College of the City of New York. As an author of books for boys he gained wide popularity. These works, mainly of a patriotic and historical nature, were produced with remarkable facility, aggregating about seventy titles. He was engaged in the book trade in connection with various publishing houses from the time he was nineteen, was editor of the *St. Nicholas Magazine* from 1884 to 1887, of *Wide Awake* from 1891 to 1893, and later was literary editor for the Lothrop Publishing Company of Boston.

BROTHERHOOD OF ANDREW AND PHILIP. See ANDREW AND PHILIP, BROTHERHOOD OF.

BROTHERHOOD OF SAINT ANDREW. See SAINT ANDREW, BROTHERHOOD OF.

BROWN, GEORGE DOUGLAS, a Scottish author who died in London August 29, 1902, was best known to readers as "George Douglas," the pseudonym under which appeared his one book, the striking *House with the Green Shutters*. He was born in West Scotland in 1869, studied at Glasgow and Oxford, became a publisher's reader in London, and in addition to general newspaper work did sketches for the *Speaker* and reviews for the *Illustrated London News*. His *The House with the Green Shutters* (1901) became a "best-selling" book in England and America. But it was more than that. It was a work of distinct merit, which evoked for its author from certain critics the title of "the Scotch Balzac." In its cruel arraignment of the

Scot—the “unspeakable Scot” of Crosland—it raised a sharp note of opposition to the sublimated portrayals of the Kailyard School.

BROWN, JOHN APPLETON, an American landscape-painter, died January 18, 1902. He was born July 24, 1844, in Newburyport, Mass., studied art in Boston under B. C. Porter, and was a pupil of Emile Lambinet in Paris. His first work to attract attention was done while traveling in Switzerland. On his return to the United States he opened a studio in Boston, and later removed to New York. He had a talent for reproducing details with unusual accuracy, and under Lambinet learned to preserve this effect without sacrificing to composition. Some of his well-known pieces are: “View at Dives Calvados, France” (1875); “On the Merrimac”; “Storm at the Isles of Shoals”; “Glen Mile Brook, Byfield, Mass.” (1881); and “Springtime” (1884). He was an associate of the National Academy.

BROWN UNIVERSITY, Providence, R. I., founded 1764. In 1902 the faculty numbered 84, against 87 in 1901, and the attendance was 940, an increase of 41 over the preceding year. The income for the year was \$575,553, with gifts to the value of \$395,306. The year was notable for building operations by which the university will secure the accommodations made necessary by its recent growth. Opposite the new library work was begun on a new clock tower, 100 feet in height, the gift of Paul Banjotti, of Turin. The Social and Religious Building given by John D. Rockefeller, will be used by the social, athletic, musical, literary, and religious organizations of the university. Other buildings already undertaken or provided for are a new dormitory, a building for civil and mechanical engineering, and the new swimming pools given by Colgate Hoyt. Brown steadily refuses to start professional schools, believing that its true function is that of an academic university. The courses have been generally stiffened.

BROWNE, JUNIUS HENRI, an American journalist and writer of war stories, died in New York City, April 2, 1902. Born at Seneca Falls, N. Y., in 1833, and educated in Cincinnati at St. Xavier College, he entered the field of journalism, and during the Civil War acted as war correspondent for the New York *Tribune*, in which capacity he attracted wide attention by his reportorial audacity and graphic descriptive powers. From May, 1863, to December, 1864, he was confined in several Confederate prisons, but finally escaped with a few companions, and traveled 400 miles on foot from Salisbury Prison to the Federal lines at Knoxville. Subsequently he contributed to various periodicals, and published *Four Years in Secessia* (1865), in which appear recitals of his prison experiences; *The Great Metropolis, a Mirror of New York*; and *Lights and Sensations in Europe*.

BRUNEI. See BORNEO.

BRUSSELS SUGAR CONFERENCE. See SUGAR INDUSTRY.

BRYAN, CHARLES PAGE, an American diplomat, was on September 26, 1902, transferred from his office as envoy extraordinary and minister plenipotentiary at Rio de Janeiro to assume similar duties in Switzerland. He was born in Chicago in 1856, and after studying at the University of Virginia and the Columbian Law College was admitted to the bar in 1878. In 1879 he removed to Colorado, where he was elected to the lower house of the legislature, served as colonel on the military staff of Governor Eaton, and for a time was connected editorially with the Denver *Inter-Ocean* and the *Colorado Mining Gazette*. Since 1883 he has been a resident of Illinois, where he was a member of the legislature for four terms, and an officer on the staffs of Governors Fifer, Oglesby, and Altgeld. In 1897 he was appointed minister to China by President McKinley, and in January, 1898, became minister to Brazil.

BRYANT, JOHN HOWARD, brother of William Cullen Bryant, died January 14, 1902, at Princeton, Ill. He was born July 22, 1807, in Cummington, Mass., and in 1831 removed to Jacksonville, Ill. In the following year, with his brother Cyrus, he went to Princeton, where he engaged in farming and also in building and contracting. He took a lively interest in politics, and was elected to several county offices and to the State legislature in 1842 and 1858. In 1847 he had edited the local Free Soil paper, and in 1852 ran for Congress unsuccessfully as a candidate of that party. He was a member of the convention at Pittsburg, Pa., that organized the Republican party (1856), and in 1860 was a member of the National Republican Convention. In 1862 he served as a collector of internal revenue. During the decade immediately preceding the Civil War his house was apparently a regular station for the underground railroad. In 1855 he published a volume of poems, which, of course, suffered from the inevitable comparison with his brother's works, but which is nevertheless highly creditable, and interesting as indicating the temperament of a poet who busied himself chiefly with the practical affairs of life.

BRYMNER, DOUGLAS, archivist of Canada, died at New Westminster, B. C., June 19, 1902. Born at Greenock, Scotland, July 3, 1823, he received a common school education in the place of his birth and began a business career, but went to

Canada in 1857 owing to ill-health, and undertook farming. After a time he entered the field of journalism and was connected editorially with the *Presbyterian*, the organ of the Presbyterian denomination in Canada, and with the *Montreal Daily Herald*. In 1872 he was appointed archivist of Canada, a public office newly instituted for the collection and preservation of Dominion historical records, which he held until his death. In 1892 he received the honorary degree of LL.D. from Queen's University, and was made a fellow of the Royal Society of Canada three years later.

BRYN MAWR COLLEGE, at Bryn Mawr, Pa., an undenominational woman's college of a high type, opened in 1885, had in 1901-02, a faculty of 43 and a student attendance of 437, of whom 67 were graduate students and 6 hearers. Its income for the year from all sources was \$226,352. Within the year 1902 the money value of gifts received reached the amount of \$572,149. A new lighting and heating plant has been installed at a cost of \$153,000. A new dormitory and a new library building in process of erection, cost \$400,000. The library was increased to about 39,000 volumes. The college lost a dormitory by fire.

BUBONIC PLAGUE. See **PLAGUE** and **VITAL STATISTICS**.

BUCK, ALFRED ELIAB, United States minister to Japan, died at Tokio, December 4, 1902. He was born at Foxcroft, Me., in 1832, and graduated at Waterville (now Colby) College, in 1859. Soon after the outbreak of the Civil War he raised a company of volunteers, and was made a captain in the Thirteenth Maine Regiment, and afterward, having raised the Ninety-first Colored Regiment, was appointed, in 1864, to the command of the Fifty-first Colored Infantry, with the rank of lieutenant-colonel. He was brevetted colonel for gallant services at Mobile, and made division inspector-general of western Louisiana in June, 1865. After the war he engaged in turpentine manufacture at Mobile, but was burned out in 1867. He was a delegate to the reconstruction convention of Alabama, was a presidential elector in 1868, and was elected to Congress in 1869. He was a delegate to five Republican conventions, was chairman of the Georgia central Republican committee after 1882, and was appointed minister to Japan in 1897.

BUCKWHEAT. Three-fourths of this crop in the United States is raised in New York and Pennsylvania. There was a slight falling off in 1902 in the yield per acre in both of these States, but in most of the other States a slight increase was noted. The average yield for the whole country was 18.1 bushels, as compared with the ten-year average of 17.2 bushels. The total crop of the year was 14,529,770 bushels, valued at \$8,654,704, as compared with 15,125,939 bushels valued at \$8,523,317 in 1901. The production of this grain in Ontario, Canada, was 1,971,930 bushels in 1902. The exports of buckwheat from the United States during the fiscal year ended June 30, 1902, amounted to 719,615 bushels, valued at \$449,917. These exports were principally to the Netherlands and Germany.

BUILDING OPERATIONS in the United States during 1902 show a gain over those for preceding years. Reports received from twenty of the leading cities of the country for 1902 have been tabulated by *Construction News*, and show the following results:

CITY.	1901.		1902.		Per Cent.	
	No.	Cost.	No.	Cost.	Gain.	Loss.
New York (Boroughs of Manhattan and The Bronx).....	4,107	\$116,800,585	4,203	\$95,969,693	18

BULGARIA, an autonomous Balkan principality under the suzerainty of Turkey. The capital is Sofia.

Area and Population.—The estimated area is 38,080 square miles. The population according to the census of 1900 was 3,744,283. Bulgars numbered 2,887,684, and Turks 530,275. Sofia had 67,920 inhabitants. The national religion is the Orthodox Greek, but it is not included in the Orthodox communion.

Government and Finance.—The executive authority is vested in a prince, who is assisted by a cabinet nominated by himself and responsible to the Sobranje. Upon this body, a single chamber, devolves the legislative power. The reigning prince in 1902 was Ferdinand I., youngest son of the late Prince Augustus of Saxe-Coburg and Gotha, who was elected by the national assembly July 7, 1887. The peace strength of the army in 1902 was placed at 2,500 officers and 40,555 men. The war strength is estimated at about 205,000. (See MANŒUVRES, MILITARY AND NAVAL.) The navy is inconsiderable.

The unit of value is the lev, worth one franc, or 19.3 cents. Revenue is derived chiefly from direct and indirect taxation and the largest expenditures are for service of the debt and for war. The estimated revenue and expenditure for 1901 were 95,-286,900 leva and 95,222,535 leva respectively; for 1902, 95,955,400 and 98,898,337 respectively; for 1903, 98,017,900 and 97,682,871 respectively. For the last year the war estimates amounted to 23,301,362 leva. In 1899 steps were taken toward converting the entire national debt into a new 5 per cent. loan of 260,000,000 leva. On July 8, 1902, however, the Sobranje voted to issue a loan of 120,000,000 leva.

Industries, Commerce, etc.—The leading industries is agriculture, and wheat is the most important product and export. Other products are wine, silk, tobacco, and attar of roses. The values of imports and exports in leva have been as follows:

	1898.	1899.	1900.	1901.
Imports.....	72,730,250	60,178,079	46,842,100	70,044,073
Exports.....	66,537,007	53,467,099	53,982,629	82,769,759

The principal imports are textiles (about 27,500,000 leva in 1901), metal wares and machinery, leather goods, and furniture. The leading exports are grain (about 51,-717,000 leva in 1901), live stock, and animal products, silk, and cocoons, and attar of roses. In 1901 British trade increased notably. The approximate values in leva of the imports from and the exports to countries of greatest trade importance were in 1901:

	Great Britain.	Turkey.	Austria-Hungary.	Germany.	Belgium.
Imports..	13,917,000	10,062,000	17,228,000	9,828,000	2,392,000
Exports.....	15,875,000	24,429,000	7,255,000	8,799,000	10,970,000

In 1900 there were 909 miles of railway in operation and 130 under construction.

History.—The persistent hostility of the Sobranje to the plan of the Karaveloff ministry to secure a loan of 125,000,000 francs from a foreign corporation, which was to exercise some degree of supervision over the revenues, brought about the ministry's resignation on December 16, 1901. The resignation was not accepted by Prince Ferdinand, but after its measure was definitely rejected by the Sobranje on December 24 it again resigned on the 28th. On January 4, 1902, the Sobranje was dissolved, and on the next day a ministry was formed as follows: Premier and minister for foreign affairs, M. Daneff; interior and finance, M. Sarafoff; war, General Paprikoff; justice, M. Radeff; public instruction, M. Kantcheff; commerce and agriculture, M. Ludskanoff. This was a Zankoffist, or Russophil, ministry. It secured a majority at the legislative elections of March 3, which resulted as follows: 97 Zankoffists (ministerialists), 33 Stoiloffists, 17 Karavelloffists, 10 Agrarians, 9 Radoslaffists, 8 Socialists, 8 Stambuloffists, 7 independents. But on March 22, by order of Prince Ferdinand, the ministry was again reconstructed (from Zankoffist material) as follows: Premier and minister for foreign affairs, M. Daneff; interior, M. Ludskanoff; finance, M. Sarafoff; war, General Paprikoff; justice, M. Radeff; public instruction, M. Todoroff; commerce and agriculture, M. Abrasheff; public works, M. Constantinoff. Still again in 1902 there was a change of cabinet. In November the ministry resigned on account of personal differences among the members, and on the 17th was reconstructed under M. Daneff's premiership. The only changes made were the succession of M. Constantinoff by M. Popoff and the exchange of portfolios on the part of M. Radeff and M. Todoroff. On February 6, 1902, M. Kantcheff, the minister of public instruction was assassinated by one Karandjuloff, a discharged schoolmaster, who immediately afterwards committed suicide. It was not believed the crime was due to political motives.

Of most conspicuous interest in 1902 were the activity of the Macedonian Com-

mittee and the continued tendency of the government to draw towards Russia. The committee, which is formed for the purpose of freeing Macedonia from Turkish rule, is active in carrying on its propaganda both in the principality and beyond the border; and to its influence, in some measure at least, are attributed many of the Macedonian outbreaks. There is little doubt that the Bulgarian government is in sympathy with the aims if not the methods of the committee, but in 1902 affairs had reached so critical a point that, in the interest of international peace, and perhaps its own existence, it was obliged to restrain, ostensibly at least, the Macedonian agitators. Indeed, on April 15 the government informed the committee of its resolution to dissolve that body, but aside from the arrest of some of the leaders later in the year, practically nothing was done. A split occurred in the Macedonian Congress, which met at Sofia on August 10. One faction of the committee, in sympathy with the ill-reputed Boris Sarafoff, the former president, elected M. Stanicheff as president; the other faction chose as its president Colonel Zontcheff, an ex-officer, who, according to one authority, is "an enthusiast, touched with that zealous readiness for martyrdom, that fiery exaltation of will, which is so characteristic of the Slavonic genius." The Zontcheff faction appeared to be working for the annexation of Macedonia to Bulgaria, while the followers of Sarafoff frankly proclaimed their object to be Macedonian independence. Colonel Zontcheff was arrested, by order of the government, on September 2, escaped, was again arrested, and again escaped on October 8, when he went to Macedonia. M. Sarafoff was arrested on September 15. For a further account of the committee, the uprisings in Macedonia, and the relations of Bulgaria thereto, see *TURKEY*.

As to the relations of Bulgaria with Russia, it may be pointed out that during 1902, the government, supported by a majority in the Sobranje, was consistently Russophil. In June Prince Ferdinand visited the Czar, arriving at Peterhof on the 10th and leaving on the 13th. His reception was cordial and clearly indicated the amicable relations existing between the two governments. On September 29 the battle of Shipka Pass was celebrated in Bulgaria, and speeches lauding Russian arms were made by Prince Ferdinand and the visiting Russian Grand Duke Nicholas Nicholavitch. At the end of 1902 it was more evident than ever that Russia is behind Bulgaria.

In October, 1902, Michael Stavreff, known as Holju, was condemned to death for the murder in July, 1895, of Stefan Stambuloff, the Bulgarian premier. Correspondence was then published by Holju's friends showing that he was only a tool in the hands of others and implicating, in the assassination of Beltcheff (minister of finance) and Vulkovitch (Bulgarian diplomatic representative at Constantinople), as well as in that of Stambuloff, many persons connected with the Bulgarian government of 1902, including the president of the Sobranje, the director of the national library, and M. Ludskanoff, the minister of the interior. The King of Roumania visited Prince Ferdinand in November, 1902.

BÜLOW, BERNARD, COUNT VON, chancellor of the German Empire, experienced in 1902 the difficulties of domestic and foreign statesmanship in a manner that severely tested his resources. In domestic affairs he was called upon to pilot the tariff bill through the Reichstag, a trying task when the number of German political parties, and especially the bitter conflict of Agrarians and Industrialists, are considered. By effecting the enactment of the tariff bill, which increases duties especially upon grain and meat and other food products, he stirred up the commercial hostility of Russia and Austria-Hungary, while exasperating the Socialists in restricting debate in the Reichstag. As the Emperor's mouthpiece in foreign policy, he was only partly successful. His references to the British army and to Mr. Chamberlain angered the English; but, on the other hand, he is credited with a share in the policy that brought about the joint blockade of the Venezuelan coast by British and German ships. He also had an important part in the renewal of the Triple Alliance in June. The chancellor was born May 3, 1849, and in 1875 began diplomatic service as secretary of the German embassy at Rome, occupying the same office afterward at St. Petersburg and Vienna. During the Russo-Turkish war of 1877 he was chargé d'affaires at Athens, and in 1878 served as a secretary at the Berlin Congress. After further diplomatic service, in Paris and St. Petersburg, he was appointed minister to Roumania in 1888 and to Italy in 1893. He was made foreign secretary in 1897, and succeeded to the chancellorship in October, 1900. Von Bülow has been described as a striking contrast to Bismarck in diplomatic manner and method. Polished and affable, he is apparently communicative, but in reality is secretive. He fully approves Bismarck's policy of friendship with Russia, and is in sympathy with the Industrialists rather than the Agrarians; but he has nevertheless advised and promoted measures that have gone far to alienate Russia commercially and to offend the Industrialists. With so masterful an emperor, his initiative is limited, and he has been an obedient opportunist; but to all outward appearance he is not more than fairly

launched upon his career as chancellor, and it remains to be seen how he will stand more prolonged tests of diplomacy.

BUOL-BERENBERG, RUDOLF, Baron von, German statesman and politician, died in July, 1902. He was born May 24, 1842, in Zigenhausen, Baden, studied law at the universities of Freiberg, Munich, and Heidelberg, entered the Baden civil service, and after becoming a judge at Mannheim in 1870 was made a judge of the supreme court. In 1881 he was sent to the Baden Landtag, and three years later to the German Reichstag, where he allied himself with the Ultramontane or Centre party. In 1892 he was elected first vice-president of the Reichstag with Centre support, and in 1895 succeeded Levetzow as president when the latter resigned at the Reichstag's refusal to notice officially the eightieth birthday of Bismarck. He was the acknowledged leader of the Clerical party in Baden and presided over the Baden Catholic Diet that assembled in 1890 and later over the German Catholic Diet.

BURKE, JOSEPH, an American violinist, died in New York City, January 19, 1902. He was born in Galway, Ireland, in 1815, and at an early age developed a remarkable talent for music and acting. When eight years of age he began to tour Europe as an infant prodigy and met with great applause in many Shakespearean parts; and after coming to America in 1830 continued his acting for several seasons. He then studied law and was admitted to the bar in 1840, but never practised. His study of the violin had continued and in 1850-51 he accompanied Jenny Lind as soloist on the American tour of her concert company. He was well known in New York musical circles as an instructor and performer of high ability until 1880, when he retired to country life at Batavia, N. Y.

BURMA, a province of British India, lying to the north and east of the Bay of Bengal, is bounded on the north by Assam and on the east by China, French Indo China (for a comparatively short distance along the Mekong), and Siam. The estimated area of Upper Burma is 83,473 square miles and the population, according to the revised census of 1901, 3,849,833; Lower Burma, 87,957 square miles with 5,371,328 inhabitants; the Burmese Shan states, about 40,000 square miles, with 1,228,460 inhabitants; total, upwards of 211,000 square miles with 10,449,621 inhabitants in 1901. The people are mostly Buddhists. The chief city of Upper Burma is Mandalay (population 183,816), and of Lower Burma Rangoon (population 234,881). The province is administered under the Indian government by a lieutenant-governor; to this position Mr. Hugh Shakespear Barnes was appointed in September, 1902, to succeed Sir Frederick W. R. Fryer early in 1903. The money of account is the silver rupee, worth one-fifteenth of a British sovereign, or about 32.4 cents. In the fiscal year 1899 revenue and expenditure (in tens of rupees) amounted to Rx. 6,989,040 and Rx. 4,462,922 respectively; in 1900, Rx. 7,043,624 and Rx. 4,573,312 respectively. Imports and exports (exclusive of trade with other parts of India) were valued at Rx. 4,919,396 and Rx. 10,187,929 respectively in the fiscal year 1900, and Rx. 6,991,507 and Rx. 10,081,715 respectively in 1901. By far the largest export is rice, which in 1901 amounted to Rx. 7,924,278. These figures do not include the small overland trade with China. In 1899 there were 936 miles of railway in operation and since that time a considerable mileage has been completed.

BURNETT, CHARLES HENRY, a specialist in ear diseases, died January 30, 1902, at Bryn Mawr, Pa. He was born in 1841, graduated at the University of Pennsylvania in 1866, and studied diseases of the eye and ear at Vienna. He was a member of the College of Physicians, and the American Aurological Association. He published *The Ear: Its Anatomy, Physiology and Diseases*, and was the editor of an encyclopædia of diseases of the ear, nose, and throat, which was completed in 1901.

BUTLER, SAMUEL, English author and composer, died in London, June 19, 1902. He was born in Langar, Nottinghamshire, December 4, 1835, and in 1858 graduated at St. John's College, Cambridge. After residing from 1860 to 1864 in the Canterbury Settlement, New Zealand, he devoted himself to painting, music, and literature. In several works he assailed the Darwinian theory, and published translations of the *Iliad* and *Odyssey*, and classical studies, among them an attempt to prove that the *Odyssey* was written by a woman. The most widely read of his writings are *Erehwon* (1872; the inverted word order of "Nowhere") and *Erehwon Revisited* (1891), descriptions of a new-found Utopia, written in the vein of Swift's *Gulliver's Travels*, and marked by vigorous and clever satire upon contemporary society, though with an over-fondness for the paradoxical. He took a keen interest in painting and architecture and exhibited several of his pictures at the Royal Academy. Chief among his musical productions is *Narcissus*, a cantata composed in the style of Handel and written in collaboration with Mr. H. F. Jones.

BUTLER, WILLIAM ALLEN, a recognized authority on American admiralty law and the author of several well-known poems, died at Yonkers, N. Y., September 9, 1902. Born February 20, 1825, at Albany, N. Y., he graduated in 1843 at the University of the City of New York (now New York University), and after

European travel studied law, which he later successfully practised in New York. As senior member of the firm of Butler, Notman, Joline, and Mynderse, he became known among the eminent admiralty lawyers of the United States. In 1886 he was president of the American Bar Association. His satirical poem *Nothing to Wear* first published anonymously in *Harper's* for November, 1887, won an inter-continental popularity and evoked a host of bogus claimants. His *General Averages* was a clever skit on sharp mercantile practices. His further publications include *Martha Van Buren* (1862); *Mrs. Lumber's Raffle*, prose fiction (1876); *Domesticus* (1886); and two volumes of collected *Poems* (1871, 1898).

CALIFORNIA, a Pacific coast State of the United States, has a land area of 155,980 square miles. The capital is Sacramento. California was admitted to the Union September 9, 1850, without ever having been an organized territory. The population in 1900 was 1,485,053, while in June, 1902, as estimated by the government actuary, it was 1,541,000. The populations of the four largest cities in 1900 were: San Francisco, 342,782; Los Angeles, 102,479; Oakland, 66,960; Sacramento, 29,282.

Finance.—The total receipts of the State treasury for the fiscal year ending July 1, 1902, amounted to \$9,905,679.65 and the total expenditures \$9,804,916.62. The balance and surplus on hand July 1, 1902, amounted to \$5,093,239.44. The main items of revenue during the year and the amounts derived therefrom were: General property tax, \$5,686,435.22; poll-tax, \$430,186.17; school loans, \$171,887.13; collateral inheritance tax, \$287,953.49; secretary of state, fees, \$143,607.80; insurance collections, \$51,000; San Francisco harbor collections, \$813,946.58; prisons, \$300,730.88; reduction of bonds, \$266,124.80; railway taxes, \$884,062.42; United States government, \$92,317.20; miscellaneous sources and transfers, \$778,327.96. The total debt at the end of the year was \$2,281,500. There was no change in the funded debt during the year, neither was any floating debt incurred. The entire funded debt of California is held in its own hands, and is therefore in the nature of a debt to itself. At the end of the year 1902, about a million dollars of school money, authorized to be invested in national, State, or county bonds, lay idle in the treasury. The interest on national bonds was so small and State and county bonds were so scarce that it was recommended by Governor Gage in his annual message that investments should be authorized in California municipal and school bonds. Owing to the fact that the State levy, applicable to the general State government, had been steadily reduced by the legislature for six years, the governor stated that either the levy must be increased again or the State would have to meet a deficiency. Complaint was made that under the general property tax, a great bulk of the personal property escaped taxation. The governor's message states that while from 1860 to 1870 the assessment of personal property nearly equaled that on real property, the personal assessment in 1902 was hardly 15 per cent. of the assessment on real estate. The governor considered that as soon as feasible the direct tax for the maintenance of the State government should be abolished as it was being abolished in New York, and an indirect tax substituted, leaving to the counties and other political and civil divisions the exclusive right to tax real and personal property.

Agriculture and Industries.—The crops for the season 1902 were large in quantity and excellent in quality. The production of wheat amounted to 22,374,201 bushels, being an average of 10.9 bushels per acre. The value of the barley crop was nearly twice that of any other State, 1,144,274 acres yielding a total of 29,751,124 bushels. The oat yield was 5,148,583 bushels. The fruit season of 1902 was unusually good. California is the first State in the production of grapes, statistical reports placing the 1902 yield at 98 per cent. of a full crop. Apples and pears were both considerably above the average. California is well supplied with live stock. According to the *Crop Reporter* the State had 1,449,249 cattle and 2,365,884 sheep on December 31, 1902. The year's wool-clip was estimated at 14,507,995 pounds.

The industries of California were particularly prosperous in 1902. San Francisco became the centre of a number of new undertakings of unusual importance. The Commercial Pacific Cable Company, financed by John W. Mackay, began the laying of the first American trans-Pacific cable—from San Francisco via Honolulu to Manila. On December 26 the cable was landed at Ohua (see **PACIFIC CABLES**). Since 1896 San Francisco's foreign shipping lines have increased in number from 3 to 13. During 1902 a number of the largest sized steamers were added to the various Pacific merchant fleets. Within the State a number of costly enterprises for the supply of fuel for power were started or completed in 1902. The Pacific slope has long suffered from lack of coal, being obliged to obtain its supply from the eastern States. But the water power and oil fields of the Sierras are now beginning to be extensively utilized. There was a remarkable increase in the consumption of oil in 1902, about 12,000,000 barrels being used. The use of oil as fuel for railway locomotives is rapidly increasing, the consumption for that purpose already being 7,000,000 barrels a year. Over 100 steamships were granted permits in 1902 to use oil-fuel. California oil refineries increased in number from 11 in 1901 to 33 in 1902. Abundant

oil has stimulated nearly all branches of mining. The director of the United States mint estimates the gold output in 1902 at nearly \$17,000,000, or about \$1,250,000 above the 1901 figures. According to his estimate, the silver production nearly doubled in 1902. Considerable prospecting and speculation were occasioned by reports of the discovery of rich deposits of nitre to the south and east of Death Valley in the southern part of the State. The Southern Pacific Railroad Company, the Southern Pacific Railroad Company of Arizona, and the Southern Pacific Railroad Company of New Mexico were consolidated in March, 1902. The aggregate capital of the consolidated companies was reported to be \$159,445,000. The United Railway and Investment Company, of San Francisco, was incorporated in May under the laws of New Jersey. Its capital was increased from \$2,500,000 to \$25,000,000.

Labor Movements.—Throughout 1902 a general movement for unionizing the trades in San Francisco was kept up with considerable success, especially among the street railway employees. The latter met with determined opposition from the owners of the leading line. In the spring of the year, however, they perfected their plans so completely that they were able to call a strike on April 19, paralyzing the main lines of transit. A demand was made for a ten-hour day, a minimum rate of 25 cents an hour, and recognition of the union. The United Railroads Company, successors of the Market Street Railway, after a week's suspension of work made satisfactory concessions and traffic was resumed. The iron-workers of San Francisco struck for a nine-hour day on May 1, and on May 5 returned to work, having obtained slight concessions.

Conventions and Platforms.—The primary elections, under the new primary law, were held in the cities August 12, 1902. The Republican State convention met at Sacramento August 25-27 and adopted a platform indorsing the administration of President Roosevelt. Other policies advocated or endorsed were: the government policy in the Philippines; the civil service system; government ship-building in the navy yards; the construction of storage reservoirs for irrigation purposes; and the suppression of "trusts." In this latter connection the platform said: "We approve such legislation as will effectually restrain and prevent all such abuses, protect and promote competition, secure the rights of producers, laborers and all who are engaged in industry and commerce, and we approve and commend the efforts of President Roosevelt to enforce the laws against illegal combinations in restraint of trade, and pledge him our hearty support in all his efforts to protect the people from all oppressive combinations of capitalists." Among things condemned in the platform, Cuban reciprocity holds a prominent place. On this subject it says: "We declare our firm opposition to all reciprocity treaties inconsistent with protection to American labor and industry to which the Republican party stands pledged, and especially to any reciprocity arrangement with Cuba, or any other foreign country, as being destructive to the interests of the beet-sugar, raisin, citrus, and dried fruits industries of California, in which large amounts of capital have been invested."

The Democratic State convention met at Sacramento September 2-3, 1902. The platform adopted favored a revision of the tariff laws; the "securing to inhabitants of our insular possessions the same personal and property rights that are guaranteed to us;" the complete exclusion of Chinese; the speedy construction of an Isthmian canal; the construction of government vessels in government navy yards; direct legislation by initiative and referendum in State, county, and municipal affairs; and the just assessment and taxation of corporate property, including franchises. The platform denounced the existing protective tariff and condemned private monopoly in every form.

The Union Labor party decided not to put a full State ticket into the field, but named candidates for the State legislature and for Congress. The leading feature of the Union Labor platform was the declaration in favor of all nominations for elective offices being made by petition, political parties not to be recognized in law. The platform also advocated rigid enforcement of the eight-hour law and urged that all work for national, State, or city purposes be done by day's work and not by contract.

The Socialist convention met at San Francisco on September 9, 1902. The platform adopted advocated the socialistic principles as set forth at the Indianapolis convention of 1901; advocated the ownership by the people of the means by which wealth is produced and distributed, protested against monopolies and trusts, and approved the organization of workmen for self-protection. E. F. Loud, Republican member of Congress from the Fifth district, who had over 6000 majority in 1900, was defeated by as large a total in 1902, owing chiefly to the hostility of trades unions to his views regarding working hours for postoffice employees.

The platform of the Prohibition party adopted in 1902 included planks favoring the initiative and referendum, the public ownership of public utilities, and the election of President and Vice-President by direct vote.

Elections.—At the regular quadrennial State election held November 6, 1902, a full

Republican State ticket was elected. For governor Pardue (Rep.) received 145,332 votes and Lane (Dem.) 143,782. The State legislature for 1903 comprises 90 Republicans, 22 Democrats, and 8 Labor Unionists.

Other Events.—On January 2, 1902, the steamship *Walla Walla*, 3069 tons, bound for Puget Sound from San Francisco, was run down and sunk by the French bark *Max* off Cape Mendocino, 39 lives being lost. There were several severe earthquake shocks in southern California July 27-31, especially in Santa Barbara County, where considerable damage was done to property. The town of Los Alamos was destroyed.

State Officers.—For 1902—Governor, Henry T. Gage; lieutenant-governor, Jacob H. Neff; secretary of state, Charles F. Curry; treasurer, Truman Reeves; comptroller, Edward P. Colgan; attorney-general, Tiley L. Ford; superintendent of education, Thomas J. Kirk; surveyor-general, M. J. Wright—all Republicans. For 1903—Governor, Dr. George C. Pardee, elected for 4 years, term ending January, 1907; lieutenant-governor, Alden Anderson; secretary of state, Charles F. Curry; treasurer, Truman Reeves; comptroller, Edward P. Colgan; attorney-general, U. S. Webb; superintendent of education, Thomas J. Kirk; surveyor-general, V. H. Woods—all Republicans. Supreme Court—Chief justice, W. H. Beatty; associate justices, R. C. Harrison, C. H. Garoutte, F. W. Henshaw, J. Temple, T. B. McFarland, and Walter Van Dyke—all Republicans except Temple and Van Dyke. For Congressional representatives see UNITED STATES (paragraph Congressional Representatives).

CALIFORNIA, UNIVERSITY OF, Berkeley, Cal., founded 1868. President, Benjamin Ide Wheeler. The students for the year ending June, 1902, numbered 3980, classified as follows: In Berkeley, graduate students, 230; undergraduate, 2248; total, 2470, of whom 1135 were women; in the university schools at San Francisco, 677, of whom 148 were women; at the Lick Observatory, 4 men; in short dairy course, 35 men and 2 women; in the summer session of 1901, 799, of whom 452 were women. Officers and teachers numbered 481. The enrollment at Berkeley in November, 1902, was 2846. In the increased attendance these well marked tendencies are evident: (1) the proportionate increase is greatest in the professional schools; (2) a relative decrease in the number of women; and (3) a widening of the student constituency. The number of entering students from without the State had risen to 14 per cent. in the fall of 1902. During 1902 a new department of political economy and finance was created under the headship of Professor Adolf C. Miller, formerly of the University of Chicago. The history department, from which the new department was separated, was reorganized under the headship of Professor H. Morse Stephens, formerly of Cornell University, who also is to direct the work in university extension. The department of physiology was reorganized under the directorship of Professor Jacques Loeb, formerly of the University of Chicago. A new department of irrigation was created under the direction of Professor Elwood Mead, formerly of the United States Department of Agriculture, while a beginning was made towards a new department of Slavic languages. The university has adopted a new, or rather reorganized the old, scheme of entrance and graduation requirements. Fifteen units of secondary work are now required for admission to each of the three colleges, 10 of which are common to all of the schools, as follows: English, 2; mathematics, 2; history, 1; Latin or modern languages, 4; physics, 1. The other 5 units may be taken from a large list of recognized preparatory subjects, but two must be in Greek for admission to the college of letters. One hundred and twenty points are required for graduation; and after the completion of at least 60 of these, which must include the 36 required points, there is given a certificate of admission into the advanced courses, many of which are of semi-professional nature. This plan recognizes a radical distinction between the work of the first two and of the last two years and also makes it possible for a student to graduate in three years. The preferred solution of the problem of the length of a college course is not a shorter course, but rather one emphasizing the changed character of the work after the sophomore year, which makes it possible for the fourth-year work to be distinctly professional. In this way the professional and the baccalaureate degree can be taken in six years. The gifts to the university for the past two years (the reports are biennial) reach \$900,000, the largest amount ever received by the university in that length of time. The additional fund from State taxes made possible a number of improvements in the equipment and in the work of the institution. See **PSYCHOLOGY, EXPERIMENTAL** (paragraph University of California).

CAMBODIA, a protected state on the Gulf of Siam between Cochin-China and Siam and forming one of the divisions of the French colony of Indo-China, has an estimated area of 37,400 square miles and an estimated population of about 1,500,000. The capital is Pnom-Penh (population 50,000). The government, nominally under the control of a native king, is actually administered by the French resident, who

presides at the state council and supervises the French officials in whose hands practically the entire control of internal affairs is placed. The budget for 1901 balanced at 1,951,487 piastres. (The silver piastre is worth about the same as the Mexican dollar.) The chief products are rice, betel, tobacco, indigo, pepper, and spices. The foreign trade is carried on largely through the port of Saigon in Cochinchina (*q.v.*), with which the trade statistics are included. In the fall of 1902 the French government contracted for a submarine cable from Saigon to Pontianak, Borneo. See **INDO-CHINA**.

CAMBON, JULES MARTIN, French ambassador to the United States since 1897, was transferred to Spain in the autumn of 1902 and was succeeded by M. Jusserand (*q.v.*). During the negotiations which concluded the Spanish-American war, M. Cambon represented Spain in drafting and signing the peace protocol. He was born in Paris, April 5, 1845, and after receiving a university education studied law and was admitted to the bar. After meritorious service in the Franco-Prussian war, for which he was promoted captain, he entered the civil service in 1871 and in 1874 went to Algeria, becoming civil director-general. Returning to France in 1878, M. Cambon became secretary to the prefecture of police, Paris, holding that office until 1882. His subsequent positions until his promotion to the diplomatic service were: prefect of the department of the North, 1882-87; prefect of the department of the Rhone, 1887-91; and governor-general of Algeria, 1891-97. M. Cambon is a man of literary taste and acquirements.

CAMEROON, a German protectorate in West Africa lying on the Gulf of Guinea between French Congo and Nigeria and extending northward to Lake Tchad, has an estimated area of 191,130 square miles and an estimated population of 3,500,000. In 1901 the white inhabitants numbered only 548. The protectorate is administered by an imperial governor, assisted by a local council. A small army of about 900 natives offered by Germans is maintained to keep order. The seat of government is Buea and the chief town Duala (formerly Cameroon). Local revenue is derived mainly from import duties. For the fiscal year 1901 the actual revenue amounted to 1,431,760 marks. (The mark is worth 23.8 cents.) Estimated revenue and expenditure for the fiscal year 1903 balanced at 4,236,600 marks, of which the imperial contribution comprised 2,205,100 marks. The most important products are rubber, palm kernels, palm oil, ivory, and woods. The leading imports are textiles, alcoholic liquors, and ironware. Imports and exports in 1900 were valued at 14,245,014 marks and 5,886,458 marks respectively. In September, 1902, it was announced that the imperial chancellor had granted a concession for the construction of a railway from the coast to a point about 250 miles in the interior. According to a report published in July, 1902, German military operations in Adamawa had resulted in bringing the whole of that district, including the German territory bordering Lake Tchad, definitely under German rule.

CAMPANILE, at Venice. See **ARCHITECTURE** and **ITALY** (paragraph Fall of the Campanile).

CAMPBELL, Mrs. PATRICK, English actress. See **DRAMA**.

CAMPBELLITES, or **CAMPBELLITE BAPTISTS**, a term popularly applied to Disciples of Christ (*q.v.*).

CANADA, DOMINION OF, the largest British colony, comprising the northern part of North America, with the exception of Newfoundland and its dependency, Labrador. Ottawa, in the province of Ontario, is the capital.

Area and Population.—The total area, exclusive of the district of Franklin, which lies mostly within the Arctic circle, is estimated at 3,653,946 square miles, including 605,253 square miles of water surface. The population in 1901, according to the census of that year, was 5,371,051, as compared with 4,833,239 in 1891. The increase during the decade was 537,812, or nearly 11.13 per cent. The provinces of the Dominion are Ontario, Quebec, Nova Scotia, New Brunswick (the original members of the Confederation of 1867), Manitoba (admitted in 1870), British Columbia (admitted in 1871), and Prince Edward Island (admitted in 1873). Besides these there are the Yukon territory and the Northwest territories, divided into the districts of Keewatin, Assiniboia, Saskatchewan, Alberta, Athabasca, Mackenzie, Ungava, and Franklin. The district of Franklin has not yet been surveyed. The question of increase in the population of Canada during 1902 was more hopefully discussed than at any previous period. The reason was that the emigration of American farmers into Manitoba and the northwest was unusually large, and took place under conditions that promised a steady increase. During the fiscal year ending June 30, 1902, the immigration into northwest Canada from all sources was about 70,000, and of these 22,000 came from the United States, as compared with 17,987 in 1901, 15,500 in 1900, and 11,945 in 1899. The indications are, however, that since June 30, 1902, the influx of American settlers has been very much larger, and estimates for the fiscal

year 1903 vary from two to three times greater than the figures for 1902. See paragraph Religion and Education.

Government.—In 1867 the provinces of Canada were united by parliamentary act into a confederation called the Dominion of Canada, and provision was made for the admission of additional provinces as need should arise. The Dominion is virtually autonomous, with a governor-general representing the British crown; his powers, however, are little more than nominal, being really exercised by the federal prime minister. In the dominion the apportionment of federal and provincial powers respectively reverses that in the American union. In the latter, the sovereign States surrendered specific powers to the federal government, reserving to themselves the unspecified residuum; in the Dominion specific powers were given to the provinces by the imperial authority, reserving the balance to the federal government. The dominion constitution combines with the principle of federalism, borrowed from the United States, the principle of responsible or parliamentary government inherited from England. The virtual executive is the prime minister, who must always command a majority of the House of Commons, and whose advice may be temporarily rejected or reserved for imperial consideration, but is never ultimately disregarded. The legislative power is vested in the King, Senate, and House of Commons. The Senate consists of 81 members, nominated for life on the recommendation of the governor-general in council; members of the House of Commons are elected for five years. Representation is based approximately upon population, the unit of representation for the house being determined by the population of Quebec, whose representation is fixed at 65 members. Upon the basis of the 1901 census the members of the house will ultimately number 210; in 1902, however, there were 214 members as follows: Ontario, 92; Quebec, 65; Nova Scotia, 20; New Brunswick, 14; Manitoba, 7; British Columbia, 6; Prince Edward Island, 5; Northwest Territories, 4; Yukon, 1.

The provinces within their sphere are self-governing, according to the parliamentary system, and their executives, as well as the executive of the Northwest Territories are nominated by the governor-general in council.

The Liberal administration of 1902 was returned to power at the general elections of 1900. The ministry was as follows: Sir Wilfrid Laurier, premier and president of the council; R. W. Scott, secretary of state; Sir Richard J. Cartwright, minister of trade and commerce; Charles Fitzpatrick, minister of justice and attorney-general; J. R. F. Prefontaine, marine and fisheries; A. G. Blair, railways and canals; Sir Frederick W. Borden, militia and defense; W. S. Fielding, finance; Sir William Mulock, postmaster-general; S. A. Fisher, agriculture; James Sutherland, public works; Clifford Sifton, the interior; William Paterson, customs; M. C. Bernier, inland revenue; W. Templeman, minister without portfolio.

Finance.—The financial condition of the Dominion continues exceptionally prosperous. The revenue and expenditure for the fiscal year ending June 30, 1902, were \$58,024,229 and \$50,739,953 respectively, leaving a surplus of \$7,284,276, one of the largest in the history of the country. The increase in revenue of \$5,509,528 over that of the preceding year was due chiefly to customs duties, which amounted to \$32,191,978 in 1902, as compared with \$28,425,284 in 1901. There were also increases in receipts from excise, posts, public works and railways. The official returns for the half year ending December 30, 1902, show a still greater prosperity. The revenue for that period was \$31,262,862, as compared with \$27,683,855 for the corresponding period of 1901, an increase of \$3,579,007. The revenue exceeded ordinary expenditure alone by \$11,713,174 and total expenditure, which was \$23,673,663, by \$7,589,199. The increase of ordinary expenditure during the six months ending December 30, 1902, was only \$467,457 in excess of the corresponding six months of 1901. The total gross debt of the Dominion in 1901 was \$354,732,432, an increase of \$8,525,453 over the previous year, and the total net debt was \$268,480,003, an increase of \$2,986,197 over the previous year. The total assets were \$86,252,428. The rate of interest on the gross debt was 3.12 and the net rate was 2.60.

Agriculture.—During the fiscal year ending June 30, 1902, there was a large increase in the sales of land in Manitoba and the Northwest Territories for settlement. During the previous fiscal year there were 8162 homestead entries, representing 1,305,920 acres, as compared with 7424, representing 1,188,160 acres in 1900. The homestead entries and sales since June 30, 1901, very much surpass all preceding records. Of the homestead entries, 2351 were made by Canadians, chiefly from the province of Ontario, 2026 by Americans, 1056 by Austro-Hungarians, 659 by Englishmen, 255 by Germans, and 182 by Scotchmen. Crop statistics are given in the articles on the separate provinces; but some idea of Canada's agricultural importance may be gained from its domestic exports. During the fiscal year ending June 30, 1902, the exports of domestic agricultural products were valued at \$37,152,688, of which wheat represented \$18,688,092, hay \$4,413,411, wheat flour \$3,968,850, oats \$2,052,559, fruits \$1,922,304, seeds \$1,309,322, and pease \$1,582,764. The exports of animals and

their products amounted to \$59,161,209; of this sum cattle represented \$10,622,539, cheese \$19,686,291, bacon \$12,162,953, and butter \$5,660,541.

Mineral Production.—The total value of minerals raised in 1901 was \$69,407,931, as against \$64,488,037 in 1900. The leading minerals produced were valued as follows for 1900 and 1901 respectively: Gold, \$27,908,153 and \$24,462,222; coal, \$13,290,429 and \$11,671,122; copper, \$3,065,922 and \$6,600,104; nickel, \$3,327,707 and \$4,594,523; silver, \$2,740,363 and \$2,993,668; lead, \$2,760,521 and \$2,199,784. The export of domestic mineral products in 1901 was valued at \$40,367,683, as against \$24,580,266 in 1900. The construction of large steel works at Sydney, Cape Breton, and at Sault Ste. Marie, Ontario, was well advanced at the end of 1902.

Fisheries.—The total value of the Dominion fisheries for the calendar year 1900 (the latest for which official statistics are available) was \$21,557,639, being a decrease of \$334,067 as compared with 1899. The value of salmon caught was \$3,893,217, cod \$3,614,775, lobsters \$3,055,350, herring \$1,853,237, and mackerel \$1,549,448. In 1900 over 80,000 men were engaged in this industry, which represented a capital of \$10,990,125. In 1900 bounties paid to the deep-sea fishermen of the maritime provinces amounted to \$158,802. The seal catch in 1901 numbered 24,422, as compared with 35,523 in 1900.

Commerce.—Trade for the fiscal year ending June 30, 1902, was the best on record. The total aggregate trade was \$423,910,444, of which the imports were \$212,270,158 and the exports \$211,640,286. The total trade was \$42,393,208 in excess of the previous year. The imports were an increase of \$21,854,633 over those of the preceding year and the exports were an increase of \$15,152,654. Of the imports, \$202,791,595 were entered for home consumption, as compared with \$181,237,988 for the previous fiscal year. Of these the United States contributed \$120,814,750 (\$110,485,008 in 1901); Great Britain, \$49,206,062 (\$43,018,164 in 1901); Germany, \$10,823,169 (\$7,021,405 in 1901), and other countries, \$21,947,614 (\$20,713,411 in 1901). The most notable inferences from these figures are the continued increase of imports from the United States, and the checking of the decline in British imports that had marked the last decade of the nineteenth century. In spite of the preferential tariff of 33 per cent. in favor of Great Britain, the percentage of increase from 46.37 to 60.75 in American imports during the last decade bids fair to be fully maintained in the next. Of the exports \$117,320,221 went to Great Britain (\$105,328,956 in 1901); \$71,197,684 to the United States (\$72,382,230 in 1901); \$3,298,912 to the West Indies (\$2,905,937 in 1901); and \$2,692,578 to Germany (\$2,141,552 in 1901).

Communications.—In 1901 there were in operation 18,140 miles of railway (as against 17,657 in 1900), with a total paid-up capital of \$1,042,785,539. Passengers carried in 1901 numbered 18,385,722 and the freightage amounted to 36,999,371 tons. The total earnings were \$72,898,749 and the working expenses \$50,368,726. The total net revenue of the Postoffice Department for the fiscal year ending June 30, 1902, excluding that from the Yukon and Atlin districts, was \$3,888,126, an excess over that of the previous year of \$466,933. The total expenditure, excluding that of the same districts, was \$3,883,016. The surplus of revenue over expenditure was \$5109, the first time a surplus in this department has been recorded. The postoffices numbered 9958. The tonnage of vessels of all kinds passing through the Canadian canals in 1901 was 5,778,496, and the tolls collected were \$261,922, as compared with \$276,658 for the previous year.

Currency and Banking.—The total paid-up capital of the banks of the Dominion at the end of the fiscal year 1901, was \$67,095,718, as against \$64,735,145 at the end of the previous year. The total assets were \$531,829,324, as against \$459,715,065 for 1900, and the total liabilities were \$420,003,743, as against \$356,394,095 for 1900. The notes in circulation were \$50,601,205, as against \$46,574,780 for 1900.

HISTORY.

Parliamentary Session.—The opening of Parliament by the governor-general, the Earl of Minto, took place on February 13, 1902. The strength of the Liberal majority in the House of Commons was increased slightly by bye-elections held during January. The speech from the throne expressed the regret of the Canadian people over the assassination of President McKinley, promised legislation for the punishment of anarchists and others who incite the commission of crimes commonly classed as anarchistic, referred to the assistance given Mr. William Marconi by the government in establishing stations for wireless telegraphy, and advocated additional commercial agencies and a line of steamers to South Africa. The debate on the address to the throne was vigorous and prolonged and brought out clearly the contrasted positions of the government and the opposition on current political questions. Moreover, the small group of irreconcilables, headed by Mr. Henri Bourassa, a French-Canadian member, raised the discussion of questions that could be easily asked but that by reason of their far-reaching imperialistic complications could not be easily answered. Such, for example, were the following matters contained in a

notification of resolutions made by Mr. Bourassa: The repeal of the Clayton-Bulwer treaty, the Alaskan boundary question, the Dominion's part in the South African war, and British Columbian legislation against the immigration of Chinese and Japanese. Most of these questions, as well as certain omissions from the governor-general's speech, were discussed in the debate on the address. In regard to questions relating to imperial matters, the attitude of the Parliament, as expressed by Sir Wilfrid Laurier, was that reasonable patience and delay are necessary. Mr. F. W. Borden, the leader of the Conservative opposition, reiterated his criticisms upon the existing tariff, which, he alleged, does not secure the home market to Canadians. The session, which was unusually brief, was prorogued on May 15. The principal measures passed were railway bills. One of these authorized the well-known contractors, Mackenzie and Mann, to connect the lines built by them in Ontario, Manitoba, and the Northwest, and to extend their system across the continent by the Pine River Pass to Fort Simpson on the Pacific coast. Another measure granted a charter for a new trans-Canadian railway, reaching to the Pacific coast. It may be noted here that in the latter part of 1902, the management of the Grand Trunk Railway announced its intention of building still another trans-continental line. The forced resignation on October 21, 1902, of Mr. J. I. Tarte, minister of public works in the Liberal cabinet, on the ground of his protectionist opinions, was a sensational episode of which the Conservative opposition made as much as possible.

Imperial Relations.—The Dominion was represented by Sir Wilfrid Laurier at the coronation of King Edward, August 9, 1902, and at the conference of colonial premiers, held in London from June 30 to August 11. At the conference the premier was accompanied by Sir William Mulock, postmaster-general, and Mr. W. S. Fielding, minister of finance. Sir Wilfrid Laurier was not so pronounced in his support of imperialism as had been expected. Fearing an unnecessary increase in the burdens of militarism, the premier held that Canada should make use of her importance as the senior self-governing colony, in seeking to postpone rather than to promote a joint organization of imperial and colonial forces for defense. In regard to preferential tariffs within the empire as a whole, the Canadian position, non-committal in some respects, virtually favored a dominion preference in the British market, but deprecated a radical disturbance of existing conditions. The British tariff on breadstuffs and grain, adopted as a war measure and going into effect on August 1, 1902, met with much disapproval in Canada, especially since the law did not provide for preferential treatment of colonial produce. It may be noted that protective tariff sentiment for Canada herself gained ground in 1902.

With regard to the South African war, the Canadian attitude remained firmly pro-British throughout 1902, and in April the House of Commons voted almost unanimously against a resolution advising a universal amnesty to the Boers, which was moved by Mr. John Charlton. Sir Wilfrid Laurier headed the opposition against it. The terms of peace were heartily approved. The return of the Canadian troops who had taken part in the war was the occasion of much enthusiasm. Probably a result of such feeling on the part of the Canadians was the announcement in the House of Commons on April 10 by the minister of defense that the government had decided to increase the militia so that Canada's forces would number 100,000 men.

The subject of new steamship lines as a means of trade expansion and of strengthening imperial relations received much attention in 1902. On August 28 it was officially announced that the Dominion government in cooperation with English capitalists had established a Canadian line to South Africa, with an annual government subsidy of \$150,000 for five years. One of the requirements is that the ships fly the British flag. Of much greater importance is the project of a fast line to Europe under the management of the Canadian Pacific. Though definite official statements are lacking, Sir F. W. Borden, minister of defense, stated in an interview that the government had practically resolved upon such a service, which would receive annual subsidies from both Canada and Great Britain, the Canadian subsidy to be \$750,000 and the British \$375,000 a year. Canada's means of communication with the empire were increased in 1902 by the completion of the British Pacific cable (October 30), as well as by the accomplishment, at the Marconi station in Cape Breton, of wireless trans-Atlantic telegraphy. A Canadian company was formed to put the wireless system upon a commercial footing. See PACIFIC CABLE and WIRELESS TELEGRAPHY.

Religion and Education.—According to the census returns the numbers of the eighteen different religious denominations which composed the population of Canada in 1901 were as follows as compared with 1891: Adventists, 8064 (6354 in 1891); Anglicans, 680,346 (646,095); Baptists, 292,485 (257,449); Brethren, 8071 (11,637); Baptists (Free Will), 24,229 (45,116); Congregationalists, 28,283 (27,157); Disciples of Christ, 14,872 (12,763); Friends, 4087 (4650); Jews, 16,432 (6414); Lutherans, 92,394 (63,982); Methodists, 916,862 (847,765); Presbyterians, 842,301

(755,326); Protestants, 11,607 (12,253); Roman Catholics, 2,228,997 (1,992,017); Salvation Army, 10,307 (13,949); Tunkers, 1531 (1274); Unitarians, 1934 (1777); Universalists, 2589 (3186); unspecified, 44,186 (89,355); various other sects, 141,474 (33,776). The educational system of Canada is under provincial jurisdiction. The higher educational institutions include 17 universities, 20 colleges, 19 classical colleges, 9 women's colleges and academies, and 5 agricultural colleges.

Crime decreased in Canada during the year ending September 30, 1901, the number of indictable offenses being 128 less than during the previous year. The decrease in the number of criminals in proportion to the populations held good in Ontario, New Brunswick, Manitoba, Prince Edward Island, Yukon, and British Columbia, while in Quebec, Nova Scotia, and the Northwest Territories, there was a small increase. The decrease in the Yukon district from 35 to 14 per cent. is considered remarkable in view of the influx of miners and the immoral life usually associated with mining towns and camps. For an account of the religious sect in Assiniboia, whose fanaticism compelled government interference in December, 1902, see ДОУКНОВОРС.

Gaynor-Greene Extradition Case.—Considerable comment was called forth in 1902 by the Gaynor-Greene case, in which the extradition was sought of Colonel John F. Gaynor and Captain Benjamin D. Greene, American fugitives from justice, who were charged with complicity with Oberlin M. Carter, formerly captain of United States Engineers, in conspiring to defraud the United States government of funds amounting to more than \$2,000,000 in connection with river and harbor improvements at Savannah, Ga., where Captain Carter was in charge. On May 14 an application for the arrest of Gaynor and Greene, made at Montreal by Mr. Marion Erwin, of Macon, Ga., who, as a special attorney-general had conducted the prosecution in the United States, in behalf of the American federal authorities, was granted by Police Magistrate Lafontaine, the extradition commissioner. The men were arrested and taken from Quebec to Montreal, whereupon Judge Andrews, of Quebec, issued a writ for their return to the latter city. This action was opposed by the counsel for the American authorities, who contended that on account of alleged political influence exerted in the prisoners' behalf there was more assurance of an impartial decision in Montreal than in Quebec. On July 4, however, Judge Caron, in Quebec, decided that the proceedings should be held in that city. Meanwhile Mr. Erwin had informed the State Department at Washington that the fugitives' counsel were connected by professional and social ties with the Canadian officials who had power to grant extradition. Attorney-General Knox authorized a request to the State Department that it bring the matter to the notice of the British Foreign Office, but Secretary Hay was disinclined to do so without fuller investigation, since Premier Parent of Quebec Province denied the truth of Mr. Erwin's charges. It was evident that the latter were based on the belief that large sums of money were being improperly used to influence Canadian officials to defeat the intent of the extradition act. In view of the technical objections made in behalf of the defendants, the Washington authorities gave notice that a new application for extradition would be made, framed precisely in accordance with the language of the treaty. When the case came up again at Quebec on August 13, Judge Caron decided that the warrant of arrest was illegal and released the prisoners on the ground that the offences charged were not within the terms of the extradition act. The decision excited much comment, even in Canada, and Attorney-General Knox said that no available means would be neglected to bring the fugitives to justice. The case illustrates the unsatisfactory character of the extradition treaty between Canada and the United States, and is believed to have afforded conclusive reasons either for a new treaty or a more liberal interpretation of the existing one. Another case of a similar kind was decided at Montreal on August 18, 1902, when the extradition of George Clark, of Lynn, Mass., was applied for on a charge of issuing checks without sufficient funds in the bank, but the defendant was released since the offence is not a felony in Canada.

Other Events.—Canada was comparatively free from industrial disturbances during 1902. There should be mentioned, however, the strike for higher wages of the Toronto street railway employees during the early part of the summer. On June 22 a riot occurred through the attempt of the company to run its cars with non-union men. A compromise was eventually arrived at, which was regarded as a virtual victory for the strikers. A terrible accident occurred on the Grand Trunk Railway at Wanstead, in the province of Ontario, on December 26, in which 28 passengers were killed and about 40 injured. See the articles on the several provinces.

CANALS. The canal work of 1902 was confined almost entirely to projects for future construction and these were notably fewer than for several years past. The Illinois and Mississippi Canal, begun a number of years ago, was the only canal for navigation purposes under construction in the United States. The improvement of the New York State canal system either by enlarging the Erie canal or by building a barge canal from Lake Erie to the Hudson River was agitated in various quarters

during the year, but this agitation resulted in no action which comes within the year's record. Isthmian canal questions were in the hands of the State Department and Congress and are reviewed in the article *ISTHMIAN CANAL* (q. v.). Of the projects for future canal construction in the United States and abroad the following deserve mention. Early in 1902 the Montreal, Ottawa and Georgian Bay Canal project was reported upon favorably by a committee of the Canadian Parliament. The estimated cost of the canal was set at \$80,000,000 by this report and the time of completion was set at 1910. As described in the report submitted by the committee, the surface water in Georgian Bay is about 564 feet above the St. Lawrence at Montreal. It is proposed to raise the water in Lake Nipissing 65 feet above Georgian Bay, making a total fall of 630 feet from the summit level. The aggregate lift of all the locks will be about 650 feet. Three locks would be used to reach Lake Nipissing from the bay and the summit level will be 69 miles long through a chain of connecting lakes. From the eastern end of this level to the junction of the Mattawa with the Ottawa there will be a fall of 137 feet and five locks in $14\frac{1}{2}$ miles. From the juncture named to Fort William the fall is 145 feet in 81 miles, requiring seven locks. From Fort William to the head of Lake des Chats, 56 miles, the fall is 115 feet and five locks are required. To Lake Deschenes, 47 miles, there is a fall of 55 feet, requiring two locks, and thence to the river below Ottawa there is a fall of 72 feet, requiring four locks. From Ottawa to Montreal the route is by the existing waterways. The total distance from Georgian Bay to Montreal by this route is 425 miles, of which four miles will be taken up by locks; 40 miles will be canal, 22 feet deep and 100 feet wide on the bottom; 74 miles will be in improved river channel, 300 feet wide on the bottom, and 307 miles will be in open lake and river suitable for 20 feet navigation without further improvement. The canal if constructed would bring Lake Huron and Georgian Bay ports 400 miles nearer Montreal than by the St. Lawrence River. In May, 1902, a bill was introduced into Congress to incorporate the Lake Erie and Ohio Ship Canal Company to build a canal at least 15 feet deep from Lake Erie to the Ohio River with a total fall of not over 600 feet. The canal would be 122 miles long and have 34 locks. A more important project of the year was the Taunton River and Boston Harbor Ship Canal, surveys for which were made by the board of harbor and land commissioners of Massachusetts. The total length of the canal as surveyed is 31.79 miles, of which 22.33 miles are straight line and 9.46 miles are curve. The canal was surveyed for a depth of 25 feet and a bottom width of 130 feet. There would be five locks. The estimated cost of the canal was set at \$57,600,000.

In Europe the ship canal begun in 1890 from the Gulf of Dantzig to Königsberg was opened for traffic in 1902. This canal is 22 feet deep, 98 feet wide, and 18 miles long, and cost \$3,500,000. Interest was also revived in the Mediterranean-Bay of Biscay Canal. This project was reported upon favorably by a committee of the French Chamber of Deputies. As proposed the canal would be 280 miles long, with 27 locks and a cross section capable of passing vessels of 3000 tons, and would cost \$263,000,000. The committee estimated the annual income from this canal at \$9,800,000. The French canal legislation of the year 1902 was, moreover, made notable by a vote of the lower house to spend \$128,045,850 in deepening, broadening, and connecting various French waterways.

CANARIES, or CANARY ISLANDS, a group of islands off the northwest coast of Africa, constituting a province of Spain, have an area of 2808 square miles. The population, according to the census of December 31, 1900, was 358,564, of whom 166,505 were males and 192,059 females. The seat of government is Teneriffe and the most important town Las Palmas. The leading products and exports include potatoes, bananas, tomatoes, and almonds and other nuts. The annual export of nuts is valued at about \$60,000.

CANCER. Active investigations of this great scourge are being conducted in most civilized countries, with the object of discovering its cause and cure. Statistics seem to prove that the disease is on the increase. In 1902 an epidemic of cancer was reported in the Faroe Islands, and Dr. Charcot, of Paris, and a party of scientists went thither to study it. In Germany, according to Wutzdorff, the number of cases has increased in Hamburg, Posen, and Bavaria, and there is an increase, though less marked, in Hanover, Saxony, Westphalia, Hesse, and East Prussia. Cancer now occurs at a younger age than formerly. No satisfactory explanation of this increase has been offered. Increases are also noted in England, the Netherlands, Norway, Switzerland, and the United States. In Russia a collective investigation of the cause of cancer is being carried on by the statistical method under government auspices, the object being to compile a map showing that the disease is virtually confined to certain districts, and if possible, to demonstrate the principles of its distribution. A committee for cancer research in Germany, headed by Dr. von Leyden, Dr. Kirchner, and Dr. Wutzdorff, is collecting statistics in that country. In England

the Duke of Bedford has promised an annual subscription of £1000 for the next three years to the cancer research fund. The search for the direct cause of cancer has been very keen, and several observers believe they have discovered a micro-organism that is responsible for the growth. Max Schuller, of Berlin, in *Médecine Moderne* (February 12, 1902) gives an analysis of his book upon the parasites of carcinoma and sarcoma. Careful experiments resulted in the discovery of parasites, hitherto unknown, which were not yeast, bacteria, or cocci. The second annual report of the Cancer Commission of the Harvard Medical School, published in the *Journal of Medical Research* for April, 1902, sums up as follows the claims of the adherents to the parasitic origin of cancer, which it was appointed to investigate: (1) that a proliferation of epithelial cells analogous to the lesions seen in cancerous tumors can be produced by certain well-known protozoa (nodules caused by coccidium ovi-forme); (2) that certain skin lesions characterized by epithelial-cell proliferation are due to the action of a so-called protozoon (molluscum contagiosum); (3) that blastomycetes are constantly present in human cancers and are the cause of the lesion; (4) that by inoculation with these blastomycetes true cancerous nodules can be produced; (5) that the endocellular bodies seen in the protoplasm of cancer cells have a definite morphology, are "parasites," and are the cause of cancer. The conclusions of the committee, reached after a year of research, are unfavorable to the foregoing propositions. The committee hold that the lesions produced by the micro-organism named are either inflammatory or granulation tissue, and not cancerous. Stecker has collected an immense number of statistics upon cancer in the domestic animals. He finds that skin cancer is not rare in horses or dogs. Urogenital cancer occurs in 56 per cent. of all cases in cattle, 23 per cent. of horses, and 8.7 per cent. of dogs. Cancer of the digestive tract occurs in 19.4 per cent. of all cases in cattle, 12.2 per cent. of horses, 14.2 per cent. of cats, and 4.1 per cent. of dogs. Cancer of the respiratory tract affects 23.3 per cent. of all cases in horses, 19 per cent. of cats, 10 per cent. of cattle, and 2 per cent. of dogs. For the cure of cancer H. A. Beaver, of England, used thyroid extract in a case that was too far advanced for operation and obtained an apparently complete cure. Other new remedies are discussed under CANCROIN, RÖNTGEN RAYS and PHOTOTHERAPY.

CANCROIN. Albert Adamkiewicz has isolated a serum from cancer juice which he calls cancroin. He reports several cases of cancer of the esophagus, tongue, larynx, stomach, and eye cured by the injection of this substance into the blood. The substance is chemically like neurin (trimethylvinyl ammonium hydrate) in composition.

CANNON, JOSEPH G., congressman from Illinois, whose election as speaker of the House in the Fifty-eighth Congress was made practically certain by the withdrawal of all other candidates in his favor during the fall of 1902, was born at Guilford, N. C., March 7, 1836. Four years later he was taken by his parents to Parke County, Ind. In 1858 he began the practice of law in Douglas County, Ill. In 1861 he was elected district-attorney of his county and held office until 1868. In 1872 he was elected to Congress as a Republican, and has been returned by his district, with one exception—1890—every two years since that time. In the Forty-sixth Congress he was appointed by Speaker Randall a member of the committee on appropriations, with which he has since been so prominently identified. At the opening of the Fifty-first Congress he was one of the principal rivals of Thomas B. Reed for the speakership before the Republican Congressional caucus, and after the latter's election was made chairman of the appropriations committee, which was the first in history to run the appropriations of a single Congress up to the billion dollar mark. Defeated in the Democratic landslide of 1890, he was again re-elected by his old district in 1892, and when the Republicans again obtained control of the House in 1894 once more became chairman of the appropriations committee, a position he has continued to hold ever since. Charged at first by the Democrats with being extravagant in his recommendations, he has now come to be looked upon by both parties as a veritable "watch dog" of the country's finances. He himself explained his policy in a pithy reply to an importunate seeker for an appropriation in the following words: "You think because I am chairman of the committee on appropriations that it is my business to make appropriations. I tell you that it is rather my duty to prevent their being made."

CAPE COLONY, a British possession, officially known as Cape of Good Hope Colony, occupies the southernmost part of Africa. The capital is Cape Town.

Area and Population.—The area, including the various accessions that the colony has received, is estimated at 276,775 square miles, and the estimated population on December 31, 1901, was 2,433,000. The population of Cape Town in 1902 was 75,563. The Dutch preponderate in the western and the English in the eastern districts. In 1901 the schools numbered 2549, with 111,539 pupils. The state expenditure on

education in 1901 was £278,049. The leading religious denomination is the Dutch Reformed.

Government and Finance.—By the constitution the executive authority is vested in a governor and a council appointed by the crown. The administration is carried on, under the governor, by a ministry responsible to the colonial Parliament. This body consists of two houses, the legislative council of 23 members elected for seven years and the assembly of 95 members elected for five years. The use of either English or Dutch is allowed in the parliament. The governor in 1902 was Sir Walter F. Hely-Hutchinson, who succeeded Lord Alfred Milner in 1901. See paragraphs on History.

For fiscal years ending June 30 revenue and expenditure have been respectively as follows: 1899, £8,781,212 and £8,190,121; 1900, £6,565,752 and £7,773,230; 1901, £8,578,076 and £10,161,043. The ordinary revenue and expenditure in the fiscal year 1901 were £7,957,499 and £7,990,161 respectively; the extraordinary, £620,577 and £2,170,882 respectively. The largest sources of ordinary revenue in 1901 were railways, £3,688,028, and customs, £2,376,341; the largest ordinary expenditures were: Railways, £2,577,444; public debt, £1,429,231; justice and police, £384,400; militia and defense, £534,224. The public debt, which has been almost wholly contracted for the construction of public works, amounted on December 31, 1901, to £31,393,435.

Industries and Commerce.—The people are engaged principally in stock raising and agriculture and, at Kimberley, in diamond mining. For the year ending May 31, 1899, the leading products included the following: Corn, 2,857,809 bushels; wheat, 2,220,847; oats, 1,810,611; barley, 830,730; and Kafir corn, about 2,000,000; wine, 4,826,432 gallons; brandy, 1,107,341; wool, 35,179,900 pounds; mohair, 6,707,379; ostrich feathers, 278,167; butter, 2,869,719.

Total imports and exports are stated as follows:

	1897	1898	1899	1900	1901
Imports	£17,997,789	£16,682,438	£19,207,549	£19,678,336	£23,992,031
Exports	21,660,310	25,318,701	23,662,538	8,147,670	10,873,273

In 1901 imports of foodstuffs were valued at £7,185,129; textiles, £5,065,843; and building materials, £1,858,129. In the same year the exports of minerals and metals amounted to £6,943,828, and animal and vegetable products £3,337,086. The leading exports in the three years 1899, 1900, and 1901 respectively were valued as follows: Gold, £13,815,683, £336,795, and £1,226,000; diamonds, £4,135,583, £3,433,832, and £4,930,000; wool, £2,183,904, £837,809, and £1,489,000; ostrich feathers, £842,000, £876,801, and £839,000; copper ore, £446,985, £498,552, and £571,000; Angora hair, £779,899, £489,905, and £503,000; hides, £408,282, £346,800, and £451,000. The exports of gold mentioned above came from the Transvaal, but are not included in the Cape export figures. The imports of specie, included in the foregoing totals, amounted to £2,516,525 in 1900, and £2,575,871 in 1901. Great Britain sends over two-thirds of the imports and receives almost all of the exports.

Communications.—On January 1, 1902, there were 2161 miles of railway owned and operated by the state, 587 miles privately owned but worked by the state, and 35 miles privately owned and worked; total, 2983 miles. There were also 139 miles under construction for private companies. The line running north from Cape Town forms a part of the "Cape-to-Cairo" Railway (*q.v.*). Up to the beginning of 1902 the capital invested by the government in railways amounted to £22,469,389. In September, 1902, the premier stated that during the preceding ten years the railways of Cape Colony had yielded a surplus of over £10,000,000. The telegraph lines in 1901 aggregated 7470 miles, with 23,431 miles of wire. The postoffices at the end of 1900 numbered 961; the postal revenue in that year was £342,431, and expenditure 346,779.

History for 1902.—An account of the military operations in Cape Colony during 1902 may be found in the article TRANSVAAL. The most salient features of Cape politics during the year were the movement for a temporary suspension of the constitution and the conciliatory attitude of the Progressive premier, Sir J. Gordon Sprigg, toward the Afrikaner Bond. It may be well to preface an account of affairs in 1902 with a résumé of the relations of the Cape political parties. After the Jameson Raid (at the end of December, 1895), there was a rather extensive political readjustment. The groups that finally formed were: The Progressives (the government party), led by Sir J. Gordon Sprigg, and representing the extension of British influence; the Opposition, consisting largely of members of the Afrikaner Bond, a political body organized primarily in support of Dutch interests; and the Independents, led by Mr. J. Rose-Innes, a conservative party, but loyal to British supremacy. The independent party virtually disappeared. In 1902 there were in the assembly 44 Progressives, 44 supporters of the Bond, and 7 of uncertain political attitude, while

in the legislative council the Bond had a majority of one. In June, 1900, Sir J. Gordon Sprigg became premier, succeeding Mr. W. P. Schreiner, and he still held the position at the end of 1902. On October 13, 1900, the Cape parliament was prorogued and, on account of the bitter feelings engendered by the Boer war, it was not called together again until August 20, 1902. Meanwhile the administration was carried on by the technically illegal means of ministerial warrants, and in some of the districts of the colony and for varying periods martial law prevailed.

Early in 1902 the Progressives (loyalists) openly expressed their fear that the opening of the legislature would mark a recrudescence of racial strife, and in February 42 members of the parliament signed a petition to the imperial authorities for the temporary suspension of the constitution, for an enactment by the imperial parliament of an indemnity bill for martial law procedure and expenditure, and for an alteration in the system of the Cape parliamentary representation. Although the Progressive ministry, with the exception of Dr. T. W. Smartt, commissioner of public works, frowned upon the movement, the agitation continued and in May the petition was presented to the governor, Sir Walter F. Hely-Hutchinson, who forwarded it to the imperial government. On May 29 Dr. Smartt resigned from the cabinet. The constitution, as a matter of fact, had been actually, though not formally suspended since July, 1901, when the parliamentary provisions for administration expired. Besides this the constitution had been violated in February, 1901, by the omission of the biennial registration of voters, and in October, 1901, by the failure of the governor to convoke the parliament. The object of the petitioners in asking for a formal suspension of the constitution was to avoid what seemed to be an inevitable continuation of racial antagonism in the parliament should that body convene. They held that if the parliament were allowed to meet the battle between the English and the Dutch would be simply transferred from the field to the legislative hall. A temporary substitution of the executive for the parliament, they argued, would obviate the necessity of any unreasonable concessions to the Dutch, would be the best means of pacification, thus making possible a wide measure of amnesty, and would hasten the movement for federation in South Africa. It was stated that many of the Dutch also approved temporary suspension; for, as they said, though desirous of supporting the government and though deprecating racial strife, they would feel obliged, in case such strife should appear,—and with the opening of parliament they admitted it would appear—to “stand with their own people.” Before the middle of June, 1902, a popular petition for suspension had received 4500 signatures in Cape Town and over 20,000 in other parts of the colony, while at the end of the month the plan was opposed, it was said, by only four newspapers in South Africa. Lord Alfred Milner, high commissioner for South Africa, though careful not to commit himself officially on the subject, appeared to favor suspension, but Sir J. Gordon Sprigg, holding that the government was equal to any contingency, remained steadfastly in opposition. Commenting upon the controversy the London *Spectator* maintained that suspension should not be resorted to unless it were clearly in the interest of South Africa, and that this could not be determined until the experiment were made of submitting to the parliament measures necessary to secure British supremacy; while if such an experiment should fail the constitution should be suspended only in certain districts of the colony dangerously antagonistic to British interests. On July 2, 1902, Mr. Joseph Chamberlain, secretary of state for the colonies, advised the governor of the Cape that the imperial government was not disposed to acquiesce in the petition. He pointed out that the parliamentary signers of the petition comprised less than one-third of the assembly and less than one-half of the council, that the ministers confident in a parliamentary majority were opposed to the measure, and that above all the formal suspension of the constitution in a self-governing colony would be an action of extreme gravity and one for which no precedent exists. The colonial secretary urged that the act of indemnity and other legislation necessary for the welfare of the colony be passed by the Cape parliament with the tacit recognition that “charges and recriminations with regard to the past can serve no good purpose among those who must in the future live together as members of the same community with common interests in the peace and prosperity of South Africa.”

The attitude of the loyalists was little modified by the imperial decision. The premier, Sir J. Gordon Sprigg, was virtually repudiated by the Progressives and his leadership of the party gave place to that of Dr. Leander S. Jameson and Dr. Smartt. While the Progressives were willing to support the premier in all matters of vital interest to the colony, they were not inclined to enter upon any compromise with the Africander Bond. Such a compromise, they held, the premier had made; he had engaged to resist imperial suspension in order to gain the Bond's support of the act of indemnity, which was necessary to prevent his impeachment for exercising the functions of government without parliamentary warrant.

The parliament was prorogued on October 13, 1900. It was not reconvened until August 20, 1902. Then the governor, Sir Walter F. Hely-Hutchinson, announced that martial law would be repealed upon the enactment of bills indemnifying the governor and all others concerned for official acts performed under martial law (including unauthorized expenditures), and for their failure to summon the parliament within the constitutionally prescribed period and to carry out the biennial registration of voters. Such bills were introduced, were subsequently passed, and on September 19, 1902, martial law was repealed throughout the colony.

Among other bills introduced at the opening of the parliament were the following: For prohibiting the immigration of Asiatics except British subjects; for segregating the natives; for prohibiting the sale of intoxicating liquors to the natives; for numerous public works and for the contribution of an additional £20,000 to the imperial navy.

During the debates on the indemnity bills the "political apostasy" of the premier became more apparent, at least to the Progressives. In June, 1902, he had denied any intrigue with the Bond leaders for parliamentary support, and on September 22 he declared in the assembly that he had not come to any understanding with them and that his course had been only what he deemed the best way to maintain imperial authority. Nevertheless, soon after the meeting of the parliament in August he had the support of the practically dominant Bond and the antagonism of his own party and of many loyal Dutch. He proposed to further racial reconciliation through the appointment of a new and, as alleged, superfluous commission to investigate the working of martial law—a commission that, according to the Progressives, would give the disaffected Dutch an opportunity for renewed rancorous discussion of their old grievances; while he reproved the loyal Dutch for protesting against their wrongs—such as boycotting—which still persisted, and refused to support their petition for new legislation dealing with sedition and restricting the sale of arms and ammunition. The relations of the parties with the government were peculiar; the Bond did not always stand with the ministry or the Progressives against it, and much friction was common. Several times the ministry was defeated, but did not resign. By the opposition of the Bond a government bill for reorganizing the colonial forces was defeated on November 3, 1902; the Progressives supported the government. It cannot be said that the position of Sir J. Gordon Sprigg in 1902 was taken with conscious disregard for the best interests of South Africa; and it is too early to say it was even unwise. Indeed, some English writers lauded it as both patriotic and far-seeing. But with the South African loyalists it was certainly unpopular.

Much relief was felt throughout the colony upon the conclusion of the Boer war and the signing of peace. On June 2, 1902, the premier stated that the extraordinary expenditure due to the war (and the plague) amounted to about £3,000,000, and that the colonial government had raised for the British forces 31,000 men, of whom 14,000 were doing permanent duty. On June 11, 1902, a proclamation was issued providing that all Cape rebels (excepting field-cornets and officials) who should surrender by July 10 or who had surrendered or been captured since April 12 should suffer no punishment beyond disfranchisement for life. Up to September 19, 1902, there had been convicted under this proclamation 3554 rebels, while 2434 were still awaiting trial.

The trial, for murder, arson, and other crimes, of the Boer Commandant Scheepers, who was captured on October 11, 1901, began at Graaf Reinet on the 18th of the following December. He was sentenced to death, and shot on January 18, 1902. On April 6 Commandant Kritzinger, who was also captured and tried, was acquitted and was consequently held as an ordinary prisoner of war. On April 30 Princess Catherine Radziwill was convicted at Cape Town of forging promissory notes in the name of Cecil Rhodes, and was sentenced to two years' detention in a house of correction.

At Cape Town on March 26, 1902, Cecil Rhodes died, and was buried on April 10 in the Matabele Matoppo in the land of his making.

CAPE-TO-CAIRO RAILWAY. This project of the late Cecil Rhodes, carried on by the British South Africa Company, progressed considerably in 1902. Aside from the extension of the main line north from Buluwayo, the chief features of the year were the projected line in the Congo Free State and the completion of the Salisbury-Buluwayo line. It was originally intended that the line from Buluwayo by way of Gwelo to Salisbury should form a part of the main line of the Cape-to-Cairo Railway, crossing the Zambesi near Kariba Gorge, but later explorations and an examination of the Wankie coal fields led to a change of plan, according to which the main line from Buluwayo is being built further west and will cross the Zambesi at Victoria Falls. Work on this line was under way in 1902 and it was expected that the coal fields would be reached early in 1903 and the Falls a year or more later. Here the river will be crossed by a steel bridge, one span of which will be 500 feet

long. The Falls are about 300 miles from Buluwayo, which is 1360 miles from Cape Town. Meanwhile the survey is being carried beyond the river.

It will be remembered that in November, 1899, Cecil Rhodes obtained the consent of the German government to build his railway through its East African territory. But it appears that the line will pass to the west instead of the east of Lake Tanganyika. On April 14, 1902, an agreement was signed at Brussels by the King of the Belgians and Mr. Robert Williams, a well-known African mining engineer, according to which the latter was granted rights of railway construction between the Rhodesian frontier and Lake Kasali. This is the most southerly point on the navigable waters of the Lualaba, one of the head reaches of the Congo, and is about 700 miles from Victoria Falls. The railway is to be constructed by an Anglo-Belgian company, of which M. Heyvaert, of the Brussels court of appeal, is president, and Mr. Williams vice-president. It is understood that Mr. Williams possesses written permission from Cecil Rhodes to connect at the frontier the Congo line with the Rhodesian line. The projected railway, as a part of the Cape-to-Cairo system, called forth unfavorable comment in Germany. If, however, the Germans ever see fit to build their proposed line from Dar-es-Salaam, on the coast, to Ujiji, on Lake Tanganyika, it is not unlikely that connection will be made with the Cape-to-Cairo Railway. Advantage will be taken of the river communication between Lake Kasali and Stanley Falls, on the Upper Congo, whence a railway is projected to Mahagi, on the Albert Nyanza, about 480 miles distant. The completion of these lines will effect through communication by rail and water from Cape Town to Cairo.

The Portuguese railway, running from Beira 222 miles to Umtali on the Mashonaland frontier and thence extended 158 miles to Salisbury, was connected with the Cape system on October 6, 1902, by the completion of the line between Salisbury and Buluwayo, 309 miles (by way of Gwelo). Thus there is uninterrupted rail communication, over the regular colonial gauge of 3 feet 6 inches, from Cape Town to Beira, a distance of 2049 miles. Of this mileage nearly 1500 miles were constructed through the instrumentality of the British South Africa Company. Communication with Beira will facilitate the northward progress of the Cape-to-Cairo line on account of the shorter freightage from the coast to the place of operation.

CAPE VERDE ISLANDS, fourteen in number, constitute a Portuguese dependency aggregating 1480 square miles in area and lying about 350 miles west of Cape Verde. According to the census of December 31, 1900, the population was 147,424, almost all of whom are negroes or colored. The colony is administered by a governor appointed by the crown and resident at Praia. For the fiscal year 1902 the estimated revenue and expenditure were 419,200 milreis and 362,328 milreis respectively; for 1903, 443,740 and 345,960 respectively. (The face value of the milreis is \$1.08.) In 1900 the imports and exports were valued at 2,843,314 milreis and 351,498 milreis respectively.

CARDINALS. The sacred college, in the Roman Catholic Church, is composed of the advisers and electors of the Pope, to whom only they are second in rank. The subjoined list gives the names and dates of consecration of the members of the College of Cardinals:

Cardinal Bishops: Antonio Agliardi (1896); Mario Mocenni (1893); Lucido Maria Parocchi (1877); Luigi Oreglia di Santo Stefano (1873); Serafino Vannutelli (1887); Vincenzo Vannutelli (1889).

Cardinal Priests: Bartolomeo Bacilieri (1901); Giulio Boschi (1901); Alfonso Capeceaturo (1885); Gian-Battista Casali del Drago (1899); Salvatore Casañas y Pagés (1895); Francesco di Paola Casseta (1899); Pietro Geremia Michelangelo Cesia (1884); Pierre Hector Couillé (1897); Serafino Cretoni (1896); Angelo di Pietro (1893); Andrea Ferrari (1894); Domenico Ferrata (1896); Giuseppe Francica-Nava di Bontifé (1899); Casimir Gennari (1901); James Gibbons (1886); Pierre-Lambert Goossens (1889); Girolamo Gotti (1895); Antoine Joseph Gruscha (1891); José Maria Martin de Herrera y de la Iglesia (1897); Georges Kopp (1893); Guillaume Joseph Labouré (1897); Benoît-Marie Langénieux (1886); Victor-Lucien-Sulpice Lecot (1893); Michel Logue (1893); Achille Manara (1895); Sebastiano Martinelli (1901); Gaetano Aloisi-Masella (1887, died November 22, 1902); François Désiré Mathieu (1899); Patrick Francis Moran (1885); José Sebastião Netto (1884); Adolphe-Louis-Albert Perraud (1893); Gennaro Portanova (1899); Giuseppe Prisco (1896); Jean de Kozielsko-Pyzyna (1901); Mariano Rampolla del Tindaro (1887); Pietro Respighi (1899); François-Marie-Benjamin Richard (1889); Agostino Richelmy (1899); Ciriaco Maria Sancho y Hervás (1894); Giuseppe Sarto (1893); Francesco Satolli (1895); Léon de Skrbensky (1901); Domenico Svampa (1894); Claude Vaszary (1893); Herbert Vaughan (1893); Alessandro Sanminiatielli-Zabarella (1899).

Cardinal Deacons: Felice Cavagnis (1901); Francesco-Salesio Della Volpe (1899); Luigi Macchi (1889); Raffaele Pierotti (1896); Francesco Segna (1894);

Andrea Steinhuber (1894); Luigi Tripepi (1901); José Calasanzio Vives y Tuto (1899). See ROMAN CATHOLIC CHURCH.

CARNEGIE INSTITUTION, Washington, D. C., founded in January, 1902, by Andrew Carnegie. President, Daniel C. Gilman. Mr. Carnegie gave ten millions of dollars to establish an institution of which the main purpose should be the advancement of knowledge and the encouragement of exceptional men likely to be successful in important investigations. The first *Year Book* of the institution was published in February, 1902. From this it appeared that there would be no available income until the first of August, 1902, and no appropriations were made by the board of trustees until their meeting in November, 1902. At that time the executive committee was authorized to expend during the year 1902-03 \$200,000 in the encouragement of researches, \$40,000 in publication, \$50,000 in administrative and other various needs, and at the same time \$100,000 was set aside for a reserve fund. The purchase of a site and the construction of buildings were considered by the board, and a conclusion was deferred for a year. Under this authority a large number of grants have been made. No complete list has been issued because many of the grants are on certain conditions, which may or may not be complied with by the persons to whom allowances are made, and also because in some cases the recipients do not wish their work to be prematurely announced. Among the grants in regard to which there is no uncertainty, there may be mentioned a liberal appropriation for the encouragement of the marine zoological station at Woods Hole, Mass., a foundation in which the leading zoologists of this country are profoundly interested. Two tables, and possibly more, have been engaged at the Marine Station of Dr. Dohrr at Naples, and Prof. E. B. Wilson of Columbia, a biologist of distinction, is the first to be selected as an occupant of one of these tables. A commission has been sent to Arizona to inquire into the conditions requisite for establishing a station in an arid region where observations and experiments may be made in respect to the conditions of vegetation in deserts. Inquiries have also been made with respect to the establishment of a zoological experimental station, on some inland site. To revive and continue the *Index Medicus*—suspended for lack of funds—a liberal appropriation has been made. In general, appropriations for experimental medicine and pathology are left to other organizations. Many of the geologists of the country have strongly urged the establishment of a geo-physical laboratory—in which many of the problems concerning the formation of the earth's crust and its movements may be investigated. This subject is likewise made the object of very special inquiry, preliminary to action by the board. Several important astronomical works have been undertaken, one of the most noteworthy being the collection and publication of the astronomical researches of George W. Hill, an American mathematician of high rank. Other astronomers have received personal grants. In physics, chemistry, psychology, geology, botany, and other branches of science, some grants have been made. In comparative philology, archæology, and the humanities, little has as yet been done. A beginning will soon be made in respect to American history. Measures have been initiated for the preparation of lists of scientific men in the United States, or for a report on the leading scientific institutions of all countries. Great importance is attached to the study of economic and social problems. The *Year Book* contains the names of a large number of expert advisers or counsellors, upon whose judgment the trustees have relied in determining whom or what to help. Among the names are many of the foremost investigators of this country. Hon. Henry Hitchcock, of St. Louis, a member of the board of trustees, died in 1902 and was succeeded by his brother, Hon. Ethan A. Hitchcock, secretary of the interior.

CAROLINE ISLANDS, a group of islands lying in the western Pacific to the north of New Guinea, together with the Pelew and Marianne (or Ladrone) islands, excepting Guam (*q.v.*), were ceded by Spain to Germany by a treaty of February, 1899, ratified by both governments in the following June. The consideration was the sum of 16,750,000 marks, or 25,000,000 pesetas, the value of 100 pesetas being fixed at 67 marks, so that the cost expressed in United States money was \$3,086,000. The total area is estimated at 802 square miles (2076 square kilometres), of which the Carolines and Pelews comprise about 560 square miles and the Marianne Islands (without Guam) the remainder. The population, which is variously estimated, is probably not much above 50,000. Administratively the islands are divided into three groups (the eastern Carolines, the western Carolines and the Pelews, and the Marianne Islands) and form a part of the Kaiser Wilhelms Land protectorate. The islands demand an annual subsidy from the imperial government of about 350,000 marks, while their revenue is only about 33,000 marks. Industry and commerce are inconsiderable. In 1900 the imports to and the exports from the Carolines were valued at 459,224 marks and 263,481 marks, respectively. In 1902 the official report "confirmed in every particular the pessimistic views of those who had originally been opposed to the purchase of these islands."

CASATI, GAETANO, Italian soldier and explorer, died at Como, Lombardy, March 7, 1902. He was born at Monza in 1838, and at the age of twenty-one, after some study in the academy at Pavia, entered the Italian army, serving under Cialdini in 1866 and becoming a captain in 1867. In 1879 he resigned, and in the service of the *Società d'Esplorazione Commerciale d'Africa* began his African explorations. He visited the Bahr-el-Ghazal region, and the districts of the Niam-Niam and Monbuttu; and in 1883, with the Russian explorer, Dr. Junker, aided Emin Pasha at Lado in repulsing the Mahdi. He was subsequently imprisoned by King Kabarega, owing to Stanley's severe attacks upon the king's subjects while attempting to rescue the besieged at Lado, and, though he managed to escape, had almost perished from exposure and starvation when finally rescued by Emin Pasha. After returning to Italy he published *Dieci Anni in Equatoria e Ritorno con Emin Pascha* (1891).

CATHERWOOD, MARY HARTWELL, an American novelist, died December 26, 1902, at Chicago, Ill. She was born December 16, 1847, at Luray, O., graduated at the Female College, Granville, O., in 1868, and settled in Newburg, N. Y. She married James S. Catherwood, of Hoopestown, Ill., in December, 1887. Her *Craque-o'-Doom* appeared in 1881, and was followed by a series of historical novels dealing with French Canadian life, among which the greatest success was attained by *The Romance of Dollard* (1889), *The Story of Tonty* (1890), *The Chase of Saint Castin and Other Stories of the French in the New World* (1894), *Old Kaskaskia* (1893) is a historical novel, in a similar manner, treating of Illinois. *The Spirit of an Illinois Town* (1897) deals with life in the west two generations ago. Her studies led her to write of the French occupation from 1673 to 1763, from a purely historical point of view, in the *Heroes of the Middle West* (1898). *The Days of Jeanne D'Arc* (1897) is also a careful historical study. *Lazarre* (1901) is based on the mystery shrouding the disappearance of Louis XVII. of France, and his alleged identity with Eleazar Williams, who passed the latter portion of his life as an Episcopal missionary in Wisconsin. Other well-known stories are: *Little Renault* (1897), *Spanish Peggy* (1899), *The Queen of the Swamp*, and *Other Plain Americans* (1899).

CATHOLIC CHURCH. See ROMAN CATHOLIC CHURCH.

CATHOLIC UNIVERSITY OF AMERICA, Washington, D. C., founded in 1887, is devoted exclusively to university training of college graduates. The chief developments of 1902 were the establishment of a college by the Dominican Fathers, adjoining the university but not affiliated with it, and the establishment of an Institute of Pedagogy in New York as a part of the university. This institute has about 150 students, all of whom are teachers in schools of New York or vicinity. The Apostolic Union has established an Apostolic College, which is about to erect its buildings on the university grounds. The university students in 1902 numbered 129, and the faculty 28. The university has an endowment, \$950,842, with an income in 1902 of \$155,975. Gifts to the value of \$56,236 were received during the year. The library contains 36,772 volumes. In 1902 Mgr. D. J. O'Connell was chosen president to succeed in 1903 the Rt. Rev. T. J. Conaty, who was to assume the bishopric of Los Angeles.

CELEBES. See DUTCH EAST INDIES.

CEMENT, PORTLAND. The manufacture of Portland cement in the United States has undergone rapid development during the past few years, and the domestic supplies now nearly suffice for the entire consumption. The production in 1901 was 12,711,225 barrels, valued at \$12,532,360; the imports were 922,426 barrels, and the exports 417,625 barrels. In 1891 the production was 454,813 barrels, the imports were 2,988,313 barrels, and there were no exports. Cement of high grade is now manufactured in this country much more cheaply than in Europe.

CENSUS. See UNITED STATES (paragraph Census Office).

CENTRAL AMERICA includes the five republics of Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador, and the colony of British Honduras. These states are treated under their own titles. Figures based on recent estimates and censuses place the area at 184,238 square miles and the population at about 4,016,000.

On January 20, 1902, a treaty of peace and arbitration was signed at Corinto (Nicaragua) by representatives of the governments of Costa Rica, Honduras, Nicaragua, and Salvador. This action was brought about through the initiative of President Zelaya of Nicaragua. The treaty, which was subsequently ratified by the several governments, provides for the compulsory arbitration of all disputes that may arise among the signatory states—questions of boundary to be submitted to the arbitrament of a foreigner of American nationality, and all other questions to that of a permanent tribunal consisting of one representative from each state. The government of Guatemala was invited to adhere to the stipulations of the treaty, and this at first it appeared ready to do, but it was not represented in the arbitration tribunal when that body convened at San José (Costa Rica), on October 4, 1902. Other

provisions of the treaty looked toward the removal of any causes of friction between the republics. It may be remarked that, however good the intention of such treaties among Latin-American states, little confidence can be placed in their real effectiveness.

In the spring of 1902 a decree of the Nicaraguan government established free trade with Guatemala and Salvador, except in articles constituting government monopolies—alcoholic liquors, tobacco, and firearms, explosives, and other munitions of war. By the treaty of 1894 with Nicaragua, Honduras acquires equal commercial advantage with the other Central American republics. The Costa Rican government, which is inclined toward a high protective policy, did not accept reciprocity.

CENTRAL ASIA, RUSSIAN, comprises nine provinces included in the Steppes, Turkistan, and Trans-Caspia, with an aggregate area of 1,548,825 square miles and a population (1897) of 7,721,681; and the vassal states of Bokhara, area 92,000 square miles, population upward of 2,000,000; and Khiva, area 22,320 square miles, population 800,000. The principal town and the seat of government of the Turkistan provinces is Tashkent, with a population of 156,414. The capital of Bokhara is Bokhara, with 75,000 inhabitants; and of Khiva, Khiva, with 6000 inhabitants. Technically the provinces are administered like other provinces of the Russian empire, but the rule in a greater part of the region is still military and not civil. There is a governor-general for Turkistan, and an army of occupation of 46,000 men is maintained at his disposal. Bokhara and Khiva are ruled by native ameers, advised by Russian residents, and they enjoy autonomy as far as domestic affairs are concerned, only their foreign relations being under Russian control.

The products of the country are various and include wheat, maize, hemp, wool, silk, tobacco, wine, fruits, and cotton. The hay crop of the Steppes (1899) amounted to 2,540,493 tons and the wheat crop (1900) to 7,707,866 bushels. In Turkistan, Bokhara, and Khiva cotton planting is one of the most important industries and is being rapidly extended. With the present transportation facilities it is impossible to get the entire crop out of the country, but this difficulty will be overcome by the completion of the railways now actually under construction or projected. Ferghana, one of the Turkistan provinces, is the chief seat of cotton production, its estimated crop in 1900 being 144,448,000 pounds. The central Asian exports of cotton to Russia by way of the Caspian Sea alone amounted in the year 1900-01 to over 214,000,000 pounds.

The railroad system, of which over 1300 miles are in operation, extends from Krasnovodsk on the Caspian, through Merv and Bokhara to Tashkent, and thence south and west to Andijan in Ferghana. There is a branch line 195 miles in length from Merv southward to Kushka on the Afghan frontier, only seventy miles distant from Herat. Work was begun on a line to connect Tashkent with the Russian and European railway systems at Orenburg on the Ural late in 1901, and in the summer of 1902 over 650 miles of track were laid on this extension, which when completed will open up an extensive new wheat and cotton region to the Russian markets.

The completeness of Russian control in the vassal state of Bokhara was manifested during 1902 in an interesting episode. The reigning ameer, Sayid Abdul Ahad, who like his subjects is an ardent Mohammedan of the Sunni sect, prepared to go with a retinue of a thousand followers on a pilgrimage to Mecca. When he informed the Russian resident of his purpose, however, the official "advised" him very strongly not to undertake the journey. Although the reason given was the prevalence of various epidemics in the cities through which the ameer would have to pass, it was understood by every one, the ameer included, that the advice was practically a command, and the pilgrimage was reluctantly abandoned. It is very probable that the present ameer will be the last native ruler of Bokhara, though it is not likely that Russia intends to disturb the government before his death. Still, his own dissatisfaction with his position and the dissatisfaction of his subjects with his rule are said to have caused him seriously to contemplate giving up the cares of state and removing to Turkey, there to pass his remaining days with his wives and concubines, supported by funds derived from the sale of his family jewels.

A serious earthquake occurred in the latter part of December, 1902, in Ferghana, the shocks recurring at intervals for a week, and laying in ruins the entire city of Andijan and the surrounding region. The official Russian figures for the extent of the casualties placed the number of deaths at 4714 and the number of houses destroyed at 33,112. A far less serious earthquake also occurred in Ferghana on April 19. In Eastern Turkistan (nominally Chinese territory) severe shocks continued from August 22, 1902, till September 3.

CEREBRINE, known also as cerebrinum-Poehl or opocerebrinum-Poehl, is described as a cerebroside with the characteristics of a glycoside, having the formula $C_{70}H_{140}N_2O_{18}$. It is made in Dr. Poehl's laboratory. Dr. M. Lion, the Russian physician in charge of the Sumara Insane Asylum, has reported astonishing results with

this substance in twenty cases of essential epilepsy and in two cases of delirium tremens. Lion believes that the brain matter which is lacking in epilepsy is supplied by cerebrine, the epileptic symptoms disappearing and recovery naturally following. See EPILEPSY.

CEYLON, an island in the Indian Ocean south of British India, is a colony of Great Britain. It has a total area of 25,333 square miles and a population (1901) of 3,576,990, an increase of 567,529 since 1891. The largest racial elements in the population are the Singhalese (2,334,817) and the Tamils (952,237). There were 9,583 Europeans. Over half the inhabitants are Buddhists. The capital, Colombo, a port on the west coast, had a population of 158,093. The government, grant-in-aid, and private schools had in 1900 a total enrollment of 208,274. There is a royal college, a technical college, and high and industrial schools in addition to the well organized elementary system.

The administration of the colony is in the hands of a governor (Sir Joseph West Ridgeway, in 1902, since 1895) assisted by executive and legislative councils. The island is divided into nine provinces, presided over by government agents. The British troops in Ceylon number 2,982, and there is a colonial volunteer force of 2,112. The local monetary unit is the rupee, valued at 32.4 cents. The revenue in 1900 amounted to 27,325,930 rupees, and the expenditure 254,321,988 rupees. The principal sources of revenue are customs (in 1900, 7,228,293 rupees), licenses, stamp tax, government lands, and the salt monopoly. The public debt amounted (1900) to £3,419,451, and the local silver debt to 3,239,585 rupees, both incurred entirely for the railway and other public works.

About one-fifth of the island is under cultivation, the acreage under the leading crops being (1900): Coconuts, 846,115; rice, 672,584; tea, 405,405; and grain, 109,095. The native industries include manufactures of gold, silver, ivory, and tortoise-shell, oil-refining, wood-carving, and pottery. The mining of precious stones and of plumbago, and the pearl fisheries in the gulf of Manaar are also of considerable importance. The imports and exports for 1900 amounted to 122,339,758 rupees and 108,926,257 rupees respectively. The principal articles of export in 1900 were tea, valued at 53,735,257 rupees, coconut products, 16,438,308 rupees; and plumbago, 9,792,495 rupees. The trade is largely with Great Britain and India. There are 298 miles of railway in operation, belonging to the government, and extensions of 215 miles have been surveyed. The Boer prisoners who were confined in prison camps in Ceylon during the war in the Transvaal were returned to South Africa after the declaration of peace. During their detention in the island their health was generally good and there were few complaints of ill-treatment, of insufficient food, or of bad quarters. The Boers in Ceylon numbered 4,913. The commander of the troops in Ceylon at the end of 1902 was Major-General Sir Hector Archibald Macdonald.

CHAMBERLAIN, Sir NEVILLE BOWLES, a British field-marshal, died at Southampton, England, February 17, 1902. He was born in Brazil in 1820, and in 1837 entered the Indian service. Throughout the Afghan war of 1839-42 he served with distinction and received many wounds; was military secretary to the governor of Bombay in 1846-47; participated in the Punjab campaign of 1848-49; and from 1854 to 1857 was commandant of the Punjab Frontier Force. He was made adjutant-general of the Indian army in 1857, and took a prominent part in the siege and capture of Delhi until forced by wounds to retire from the field. His conduct during the Umbeyla campaign of 1863, which he directed, was likewise characterized by great personal gallantry. He was made commander-in-chief of the Madras army in 1876, serving in that capacity until 1881, was military member of the council of the governor-general of India, and headed a special mission to Shere Ali, the ameer of Cabul, which was stopped at Ali Masjid and could not prevent the war with Afghanistan that immediately followed. In 1900 he received the rank of field-marshal in recognition of his long and distinguished service.

CHARITY ORGANIZATION. In 1902 there were 145 societies for organizing charities in different cities of the United States. The plan and scope of the work is similar everywhere, viz., to organize and systematize charity work so as to prevent indiscriminate giving, and the duplication of really helpful work. The societies for organizing charities throughout the country were active during 1902 chiefly in combating tuberculosis, establishing free public baths in the crowded tenement districts, suppressing street begging, establishing juvenile courts, and demanding more efficient child-labor laws. In several States legislation was secured, establishing commissions to investigate the facts relating to tuberculosis. The objects of the societies everywhere are: (1) To teach that tuberculosis is a communicable, preventable, and curable disease; (2) to teach the means to prevent it; (3) to provide special hospitals, sanatoriums, etc., for consumptive adults and scrofulous and tuberculous children among the poor; (4) to aid in the adoption of measures to prevent the development of scrofulous and other forms of tuberculous diseases.

The Free Hospital for Consumptives in Philadelphia estimated that they had already lowered the death rate from consumption in Pennsylvania 33 1-3 per cent. With properly equipped sanatoriums sufficient to treat 5,000 patients yearly, the hospital reported that consumption can be completely eradicated in Pennsylvania in fifteen years. The cost was estimated at \$1,000,000 for equipment and \$400,000 yearly for maintenance and treatment, making a total cost of but \$1,500,000. This would be a very small sum to pay for ridding the State of this terrible and costly disease.

The movement for free public baths was vigorously pushed. Twelve cities in the United States now have free public baths. The measures to suppress mendicancy, while producing most wholesome results in the cities where applied, for the most part merely drove the beggars to the towns and cities where no organization society exists, to feed on the misdirected charity of people who give without knowing for what. Experience emphasized the necessity of a more complete organization of charitable work on national lines, so that concerted action may be brought to bear on the tramp and mendicant problem. The cities can never be rid of vagabonds so long as the smaller towns and rural villages pay the transportation of "sturdy beggars" to the cities. More was accomplished than ever before, however, not merely to suppress but to cure permanently the evil of mendicancy.

New York City.—The Charity Organization Society of New York was founded June 30, 1882. The officers are Robert W. de Forest, president; Edward T. Devine, general secretary; J. Pierpont Morgan, treasurer. The year ending June 30, 1902, is reported as "the most fruitful, and, from the standpoint of preventive and constructive charity, the most satisfactory in its entire history." The principal objects achieved were the creation of the Tenement House Department for enforcing the new tenement-house law, for the enactment of which the society was largely responsible; the creation of a committee on the prevention of tuberculosis; the further development of the school in philanthropic work; and the work of the committee on mendicancy to suppress street begging. Industrial conditions were exceptionally favorable to constructive social work. The unemployed were so mainly from choice or from physical disability. During January, February, and March, 1902, the proportion of union laborers reported out of employment was 6.2 per cent. In no recent year had it fallen below 10 per cent. The small number of applications for assistance indicates that equally favorable conditions prevailed in the ranks of unorganized labor.

During the year ending June 30, 1902, there were 37,108 applications for relief to the Charity Organization Society of New York City. The society investigates every case coming to its attention and keeps a record of every applicant. It not only gives intelligent assistance, or directs the applicant where to go for the proper assistance, but it sifts out and prosecutes impostors in order to protect the charitable public. In emergency cases it is necessary to give relief immediately, leaving the investigation until afterwards. Nearly \$31,500 was expended in this way during 1902.

The appointment of Mr. Homer Folks as commissioner of charities, brings the society into closer relations with the department of public charities, since Mr. Folks had been for years a member of the committee on dependent children, associate editor of *Charities*, and closely connected with charity organization work.

The work done to provide more and better free baths in the crowded districts was especially important. Contracts were let to supply nine of the public schools with shower baths. The experiment was looked upon doubtfully; but the records of the number of children using the baths show that they are greatly appreciated. The city now has two permanent baths. During 1902, contracts were let for three more permanent baths for Manhattan and two for Brooklyn at a total cost of \$435,895 for construction. Another bath is being erected for the city by Mrs. Elizabeth M. Anderson, so the city will soon have eight permanent baths. The success of the two now operating makes it certain that this form of public expenditure accomplishes much good. In addition to these a great floating bath to cost \$200,000, at the foot of East Twenty-third Street was provided for.

The fifth session of the summer school for charity workers was held June 16, to July 26, 1902, with forty members registered. Plans were made to extend the work to a two years' course in the future. Much has been accomplished by this summer school in educating workers who carry the methods of organization elsewhere.

Philadelphia.—The most important organization work of the year was the better systematization of charity work. There were 1,286 separate charities, religious and secular, in the city in 1902, of which 755 give material relief to needy Philadelphia families. Much work and assistance has been duplicated in the past. The society for organization of charity, accomplished more than ever before during 1902 to diminish this demoralizing waste of effort, and indiscriminate distribution of aid. The society dealt with 6,664 different families during the year. A new "Wayfarer's Lodge" was opened May 28, 1902, to furnish clean and comfortable lodgings to homeless men, for

an equivalent in work. The distribution of fuel was systematized. New legislation for the punishment of wife deserters was drafted, and a special fellowship for the study of homeless men was established in conjunction with the University of Pennsylvania.

Indianapolis.—The Charity Organization Society of Indianapolis was especially active in the suppression of street begging. To beggars is offered the opportunity of learning a trade by which to earn a living, or of free support in an institution without work, but not one accepted the proffered aid. Nearly all drink and live in the foulest homes. The great obstacles in the way of a complete reform are indiscriminate giving and the free mission and lodging houses which entertain tramps without an equivalent in work. The society dealt with 783 applications representing 2808 individuals. The Dime Savings and Loan Association collected \$45,007.60 during the year. A court for the trial of juvenile offenders was established. The better housing of the poor was seriously agitated.

Hartford.—The Charity Organization Society received 2,709 applications during 1902. Hartford enjoys the evil repute of having worse housing conditions than any other city of its size. Owing to the watchfulness of the society, new tenements erected were made more sanitary.

Chicago.—The Bureau of Charities, at the invitation of the railroad companies, took charge of the investigation of applications for charitable concessions in railway fares. This arrangement prevents imposition by professional tramps and secures the benefits of low rates to those in real need of them. In the year ending May 20, 1902, 1,320 persons were sent away from Chicago to more favorable localities. It was found that 25 per cent. of the inmates of the hospital, the poorhouse, and the insane asylum were not legal residents of Cook County. More than \$150,000 a year was being paid by Cook County taxpayers for the care of persons who should have been cared for elsewhere. A fund was set aside for the purpose of deporting non-resident dependents. The bureau advocates a law compelling such dependents to return to the communities on which they have a rightful claim for support. Police stations were closed to lodgers and a municipal lodging house was opened on December 22, 1901, at No. 12 South Jefferson Street, where all homeless men may obtain lodgings for a limited time for a reasonable compensation in labor. The experiment was so beneficial that it has been continued.

The National Conference of Charities and Correction.—This is composed of the State Boards of Public Charities of the several States, where they exist, of delegates appointed by the governors of other States, of charity organization societies and associated charities in the country, and of persons connected officially or unofficially with charity work. It has no formal constitution. Its twenty-ninth annual meeting was held in Detroit, Mich., May 28 to June 3, 1902. Its next session will be held in Atlanta, Ga., in May. Its officers are: President, Robert W. de Forest; secretary, Joseph P. Byers, Columbus, O.

Legislation.—The volume of charity legislation was very much less during 1902 than for the preceding year, because few State legislatures met in 1902.

Iowa.—The legislature appropriated \$138,000 for completing and furnishing the Cherokee State Hospital and for the purchase of land. In addition to the regular support appropriations for the various charity institutions, the legislature made special appropriations amounting to \$716,577.50. A bill creating a reformatory for men after the Elmira plan, failed to pass.

Kentucky.—An appropriation was made for improving the schools of reform at Lexington. The appointment of an inspector of labor at a salary of \$1,200 a year and two assistants at \$1,000 each, was authorized. These officials are to be under the supervision of the commissioners of agriculture, labor, and statistics. The same law provides a fine ranging from \$25 to \$250 for the employment of children under fourteen years of age in any factory, mine, or workshop. Three bills were attempted, but failed to pass: (1) To create a State Board of Charities. This was killed by the extravagance and political bearings of some of its provisions. (2) Providing for a central controlling board for the insane asylums in place of the local commissioners. (3) To establish an epileptic colony at the Central Asylum.

Maryland.—The Maryland legislature passed more charity legislation than has been the case in many years. The school attendance law (applying only to Baltimore and to Alleghany County) went into effect on September 1. It provides that all children between eight and twelve, physically and mentally fitted, must attend the public schools unless receiving adequate instruction elsewhere. Children from twelve to sixteen must also attend school unless legally employed at home or elsewhere. Such employment is forbidden if they cannot read and write, unless they attend school. The enforcement of the law is placed with twelve attendance officers. Penalties are provided for those employing children illegally, or preventing them from attending school. The child-labor law was amended by raising the legal working age from twelve to fourteen, except when a child is the only support of a widowed

mother, an invalid father, or is solely dependent on self for support. Special magistrates were created for the trial of juvenile cases. The Workman's Cooperative Insurance Act aims to protect employees in dangerous trades. A free employment bureau to bring employers and laborers together was created for Baltimore, and inspectors of sweat-shops and factories provided. A tuberculosis commission to be appointed for two years by the governor was authorized.

Massachusetts.—An appropriation of \$130,000 was made for additions to the Massachusetts School for Feeble-Minded. A bill was passed transferring the licensing of boot-blacks and newsboys under fourteen from the board of aldermen to the school committee.

Montana.—Money was appropriated to build an addition to the Orphans' Home at Twin Bridges, and to double the size of the school for the blind and deaf at Boulder. These additions were completed in 1902.

New York.—The legislation recommended by Governor Odell, (1) placing State insane hospitals under the control and management of the State Commission in Lunacy, and (2) centralizing in a single superintendent the work of the boards of managers of the State charitable institutions, was vigorously opposed by the society and all those especially interested in the welfare of the inmates of these institutions. The first recommendation was enacted into law, but with the opposition of the State Board of Charities the latter was prevented from passage, and a measure creating a fiscal supervisor of charities, with a \$6,000 salary, was substituted. The economy of this measure is seriously doubted by those in position to know. An important act secured by the New York Charity Organization Society was the establishment of a court for juvenile offenders in the city of New York. To the court of special sessions of the first division was given jurisdiction in all such cases, and on September 2, 1902, the court was opened in the Department of Public Charities. The vigorous attempts made by certain contractors and builders of Manhattan and Brooklyn, to secure the amendment of the tenement-house law amounting to a virtual repeal, were unsuccessful.

Ohio.—A law empowering cities and villages to erect and maintain public bath-houses, was enacted. A commission to investigate tuberculosis and the feasibility of its treatment in sanatoriums was authorized. The gross misrepresentation as to ages of children employed in factories led to the enactment of a law empowering the State factory inspectors to administer oaths and take affidavits in matters connected with the enforcement of the factory laws. A juvenile court law for Cleveland, modeled after the Illinois law, was passed.

Rhode Island.—A bill was enacted providing for a State sanatorium for consumptives. Some important legislation concerning the employment of children in factories was enacted. This law requires that children up to the age of thirteen years and up to fifteen years, unless the child is working or has completed eight years of the school course above the kindergarten, shall attend school throughout the year.

Virginia.—The legislature appropriated \$180,000 for additions and improvements to the penitentiary. Liberal appropriations were made to the other State institutions for charity and correction.

Porto Rico.—The control of the Director of Charities, who succeeded the former Board of Charities, extended over four institutions; viz., the Insane Asylum with 200 inmates, Boys' Charity School with 300 inmates, Girls' Charity School with 200 inmates, and the leper colony with 25 inmates. The legislature in 1902 authorized an asylum for the blind to accommodate 150 inmates. The island is too much of a pauper itself to be able to do much in charity for its inhabitants, but the budget for charities was increased from \$83,000 in 1900 to \$140,000 for 1902-03.

CHAUTAUQUA SYSTEM OF EDUCATION. A plan of popular education organized in 1874. The sessions of the Chautauqua summer schools for the season of 1902 covered the period July 25 to August 15. There were 159 courses offered by 89 instructors. The total registration was 3,353, or 2,237 without duplicates, not including the clubs for boys and girls, which furnish systematic recreation and instruction for the younger residents of the Chautauqua colony. The Girls' Club registered 243, and the Boys' Club 346. An elementary vacation school, with 62 children in 1902, takes care of the children between the kindergarten age and the time when they can enter the clubs. The Delsarte department registered 108. In addition to the regular Chautauqua schools there is also held at Chautauqua a New York State Summer Institute open to teachers of the State. In 1902 13 instructors offered 26 courses. The registration was 537. Free nature-study courses were provided in cooperation with Cornell University and were largely attended. The library school, inaugurated in 1901, was continued with increased efficiency. During 1902 an arts and craft school was organized and met with great success.

CHEMISTRY. The presiding officers of the two greatest bodies of English speaking scientific societies in 1902 were both chemists. James Dewar, of the Royal Institution, was president of the British Association, and Ira Remsen, of Johns

Hopkins University, was president of the American Association. Dewar said that science is advancing in so broad a front by efforts of so great an army of workers that it would be idle to attempt within the limits of an address anything like a survey of chemistry alone. He therefore devoted his address to the results of his own splendid efforts to find absolute zero, in the course of which he described the properties of liquid hydrogen and helium more fully than has ever been done before. Of special interest was his announcement of a belief that the upper atmosphere is composed of very light or difficultly condensable constituents, such as hydrogen, helium, argon, krypton, xenon, etc., which exist only in minute quantities in the lower regions of the air. As tending to support this belief he called attention to the fact that Pickering's spectrum of a meteor shows lines corresponding to hydrogen and helium; and Stasano's collection of observations of the spectrum of the aurora gives many lines due to the more volatile gases of the atmosphere. Pickering's spectrum of a lightning flash gives nineteen lines, two of which correspond to nitrogen and oxygen, three to hydrogen, and eleven to argon, krypton, and xenon. Dewar also called attention to the fact that the Royal Institution, which was founded in 1799 by Count Rumford, an American citizen, and which had received considerable bequests from Thomas G. Hodgkins, also an American citizen, possessed an average annual income of only \$6,000, and yet the returns to science by his predecessors, Young, Davy, Faraday, and Tyndall, demonstrated the wisdom of endowing education. The Carnegie Institution will dispose in a year of as much money as the members of the Royal Institution have expended in a century upon its purely scientific work.

Organizations.—The American Chemical Society, which has now a membership of 2,188 persons distributed among fourteen local sections (the Cornell section having been established in November, 1902), held two meetings during the year, the first in Pittsburg, Pa., contemporaneously with the American Association for the Advancement of Science under the presidency of Ira Remsen during June 30-July 1, when twenty-three papers were presented; the winter meeting was held in Washington during December 29, 1902-January 3, 1903, also at the same time as the American Association, when the titles of twenty-two papers were presented, and President Remsen delivered a retiring address on *The Life History of a Doctrine*, in which he discussed the development and present condition of the atomic theory, concluding with the statement that "the doctrine of atoms is still alive." The chemical section of the American Association met in Pittsburg under the presidency of Henry A. Weber, of the Ohio State University, who after delivering an address at the Washington meeting on *Incomplete Observations*, in which he indicated several cases where investigators had failed to carry out their researches to a perfect conclusion, leaving other chemists to bring the subject to a satisfactory end, retired from the chair, giving place to Charles Baskerville, of the University of North Carolina. The New York section of the Society of Chemical Industry held eight general meetings from October till June, at which thirty-four papers were read, and during the year 130 new members were added, making a total of 975 members in the United States. A general meeting of the entire society will be held in New York during 1903. On April 3, 1902, the American Electro-Chemical Society was formed in Philadelphia, and of the new organization Joseph W. Richards, of Lehigh University, was chosen president, and Charles J. Reed, 3313 North Sixteenth Street, Philadelphia, Pa., secretary.

Atomic Weights.—In 1900 an international committee on atomic weights was organized, composed of more than forty representatives from chemical and other societies. This committee delegated its duties to a smaller body, consisting of F. W. Clarke (United States), T. E. Thorpe (England), and Karl Seubert (Germany), who have recently submitted their report, giving a table of the atomic weights both on the oxygen standard (16), and the hydrogen standard (1). Their report further shows changes in antimony from 120 to 120.2; germanium from 72 to 72.5; hydrogen from 1.01 to 1.008; lanthanum from 138.9, the average of recent results by Jones 138.77, and by Brauner and Pavlicek 139.04; for palladium 106.5 has been provisionally adopted; radium appears for the first time with 225 as its atomic weight; selenium from 79.1 to 79.2; tin is advanced from 118.5 to 119; uranium, according to recent researches by Richards and Merigold, is made 238.5; and for irconium 90.6 is accepted as the most probable value.

New Elements.—The discovery of new elements is made from time to time, but the corroboration of the announcement is often long delayed. Pribram reports the discovery of a new element in the mineral orthite from arendal, for which he proposes the name austrium, with the symbol At. It is said to show three characteristic lines in red, one each in blue and orange, and several in the ultra-violet portion of the spectra. The properties of its salts and studies as to its atomic weight seem to indicate that its place in the series of elements is between those of gallium and indium. In July, 1902, Marckwald announced before the Physical Society of Berlin that the so-called polonium, found in uranium ore, consists substantially of ordinary

bismuth and of a new element, in the proportion of a thousand to one. The new metal can be separated by electrolysis. The rays it emits are like those of radium, but differ in being almost completely absorbed by paper, as well as by glass. The chemical analysis of the new metal is difficult, as one ton of ore contains hardly one gram of the new element.

Physical Chemistry.—Lord Kelvin has recently reviewed the theoretical and experimental work that has been done on the problem of absolute molecular dimensions, and he concludes that the number of molecules in 1 cubic centimetre of gas is not less than 10^{20} , and is probably greater; hence the weight of one molecule of hydrogen is calculated to be 0.9×10^{-21} gram. The condition known as "the nascent state" which has long been accepted as an explanation of various facts in electrochemistry should, according to C. J. Reed, be put aside as no longer needed, for he contends that the result may be traced to hydrogen. He claims that freed hydrogen has no special mysterious power of reduction, but simply transmits the energy or electric charge that it has received from the electric circuit to another body; that is, it acts simply as an electric conductor and behaves not differently at a kathode than in any other part of the electrolyte. Frank W. Clarke announces as a new law in thermochemistry that in any class of compounds the heat of formation is proportional to the number of atomic linkings within the molecule, and seems to bear no relation to the masses of the atoms which are combined. The study of radio electricity has been zealously prosecuted and most successfully by E. Rutherford and F. Soddy, of Montreal, who devoted much attention to thorium, in which substance they find that the activity is confined to a very small fraction of the mass, which continuously changes. Ordinary inactive thorium is continually turning into the active form, and this again changes into a third form, which is also inactive. The substance thus keeps on losing energy by its radiation and will presumably in the course of millions of years become entirely inactive. J. J. Thomson in a recent paper called attention to the fact that the study of the Becquerel rays in uranium and thorium had led to the discovery of radium, polonium, and actinium. Concerning the first, he said radium is self-luminous, shining with a bluish light; it, like Röntgen rays, makes a sensitive screen phosphoresce; it shows the bones in the hand, and is so vigorous that it has produced sores on those who have incautiously carried it about their persons. The radium emits negatively electrified particles with a velocity in some cases approaching that of light. This continued emission of particles from the radium of course implies that the radium is losing mass and energy. The loss of mass is exceedingly small; from the results given by Curie for the amount of negative electricity emitted by the radium it follows that the loss of mass would only amount to about one-thousandth of a milligram in a million years for each square centimetre of surface. In consequence of the tremendous velocity with which the particles are projected, the amount of energy radiated is quite an appreciable amount, being sufficient, if converted into heat, to melt in a million years a layer of ice of the same area of the radium and more than a quarter of a mile thick. A practical application of the radiations from this rare element is thus described: a metallic screen held between the eye and a vial containing radium does not prevent the healthy eye from seeing. If the retina of a blind person is healthy, it will be affected by radium rays.

Inorganic Chemistry.—In addition to the remarkable work in connection with those elements that show radio activity already mentioned, much research has been made in the domain of inorganic chemistry. Jaubert has taken advantage of the property possessed by certain metals, such as sodium, potassium, and their alloys of absorbing oxygen when heated in a current of air and then yielding up the same when dissolved in cold water, and has prepared such compounds, to which he gives the name of oxyoliths. These are sold in small pieces, and when placed in receivers of a convenient form and brought in contact with water furnish oxygen that is chemically pure, so that the chemist or physician is able now to readily produce the gas which formerly required for its transportation heavy cylinders. Urbain and Lacombe have discovered a new volatile salt of glucinum which, owing to its peculiar physical properties, seems to confirm the belief that its base, i.e., glucinum, is diatomic. Among its chemical properties is the fact that it is a basic salt which is formed in a solution that is extremely acid. Another salt that has created considerable interest is the lithium silicide which has been obtained as bright indigo blue crystals that are very hygroscopic and are violently decomposed by water, acids, and the halogens. Moissan continued his interesting work with the electric furnace, and during 1902 obtained metallic tantalum by reducing tantalic acid with powdered carbon after heating his mixture for ten minutes with a current of 800 volts and 60 amperes. His reactions with the metal seem to class it as a metalloid rather than a metal. Orloff published some experiments made by him that served to indicate a belief in the existence of a peculiar modification of sulphur which has a blue or (when mixed with the yellow form) green color, and which is very unstable. The indications are that the molecule is analogous to that of ozone and has the formula

So. As the result of the researches of M. Guichard there is reason to believe that the five blue oxides of molybdenum are simply mixtures of the trioxide. Camille Matignon has studied the salts of certain rare elements and has described his method of preparing and the properties of the anhydrous chlorides of samarium, yttrium, and ytterbium. The rare earths of the yttrium group have been studied spectroscopically by L. M. Dennis and Benton Dales, of Cornell, who found in the mineral sylvite from Virginia and Texas lines that correspond to yttrium, ytterbium, erbium, thulium, holmium, samarium, dysprosium, and possibly didymium. According to K. Feist, the crystalline constituent of Kermes mineral hitherto regarded as antimony oxide is shown to be sodium pyroantimonate. W. C. Heraeus finds the melting point of manganese to be 1245°C .

Organic Chemistry.—Nearly 900 pages in the *Journal* of the London Chemical Society are devoted to abstracts of papers on organic chemistry published during 1902, and while the larger proportion are from German sources, still much good work is now being done in France and in the United States. Marcel Delépine described briefly before the French Academy his methods of preparing iminodithiocarbonic esters together with their properties. Carl Graebe discussed in the *Berichte* the various representations of the space formula of benzene, and suggests a new figure prepared by joining up by two edges three pairs of tetrahedrons joined by two apices. Theodor Posner continued his elaborate studies on the disulphones, and published the eighth section specially devoted to the mercaptols and sulphones from diketones, and in the ninth paper he considers the derivation of unsaturated ketones containing sulphur. A new liquid hydrocarbon which boils at $142\text{--}145^{\circ}\text{C}$., and named salvene, has been obtained from the German oil of sage by H. Seyler. Moissan announces a new synthesis of formic acid by passing a rapid stream of pure dry carbon dioxide over crystalline potassium hydride which has been volatilized along a glass tube. The indefatigable Arthur Hantzsch continues to add to his many contributions, and during the year published *Quinonoid Diazo-compounds and the so-called Triazolens; Decomposition of Diazonium Salts by the Aid of Alcohol; Structurally Isomeric Cyanurates; and Desmotropism of Trimethylethylene Nitrosite*, as well as *Azotates of the Patty Series*, in the preparation of the last-named of which he was aided by M. Lehman. P. Sabatier and J. B. Senderens announced before the French Academy a new synthesis of methane by passing carbon dioxide and hydrogen over reduced nickel at a temperature of about 300°C . M. I. Konowaloff, a Russian chemist, published the methods used by him in accomplishing the synthesis of tertiary alcohols by means of organo-magnesium compounds. Saponarin is the name given by G. Barger to a new glucoside which he obtained from saponaria. C. Renz describes a series of compounds of thallic chloride with organic bases which he prepared. The production of acetone from crystallized egg-albumin by treatment with hydrogen peroxide and copper sulphate is announced by Arnold Orgler. An elaborate discussion on the *Constitution of the Oxazine and Thiazine Coloring Matters and their Relationship to the Azonium Compounds* was published by F. Kehrmann in the *Annalen*. Under the name of iminoxanthioides L. Tschugaeff describes a new class of colored organic compounds most of which are red. Manneotetrose and mannitrose are the names of two new sugars found by C. Tauret in manna, the exudation of *fraxinus ornus*. C. F. Mabery, of Cleveland, added much to our knowledge of the composition of petroleum in a paper in the *American Chemical Journal*, which had as its subtitle "Hydrocarbons in Pennsylvania with Boiling Point above 216°C ."

Industrial Chemistry.—It has been known for some years that it was possible to manufacture sulphuric acid from the gases obtained by burning pyrites, but it was not until the publication early in the year of a description of the method used that the details became known. The fact that the gases mentioned, when purified and carried to the laboratory, and then passed over a contact-mass containing finely divided platinum, the sulphur dioxide became completely oxidized to the trioxide or to sulphuric acid, and if water was present, appears to have inspired the improved process. At first all attempts to accomplish a similar result on a commercial scale failed, as the contact-mass quickly became inert. Small quantities of arsenic present proved to be the cause, and their removal by washing solved the difficulty, and the process became a success. The extraction of metallic calcium from lime and other salts by electrolysis has been successfully accomplished by Borches. The metal which now has a value of \$2,000 a pound will be reduced in cost to less than 50 cents a pound. The special value of the new metal will be in chemical research and in the production of new organic compounds, for which purposes there has long been a demand for a reducing or deoxidizing agent stronger than aluminum, magnesium, or zinc, and weaker than sodium and potassium. It is also likely to be of great importance in the iron industry. At present aluminum is used to free iron from sulphur and phosphorus, the result being an iron containing aluminum, which though less injurious than sulphur or phosphorus, is still undesirable. If calcium, as there is reason to believe, dissolves but sparingly in iron without injuring its strength and

tenacity, the iron industry will create an extensive demand for the new metal. Metallic strontium, it is said, has also been obtained by a similar method. A new alloy of unknown composition is announced by M. P. Germain. Its density (20.5) is superior to bronze, and a little above that of gold, and it is less liable to fracture than steel, but is tempered exactly in the same manner as steel. The color is yellow, it is inoxidizable, and resists acids. It is also very elastic and is welded without being heated, by hammering. Its electric conductivity is 98. It has been found that when aluminum is alloyed with from 2 to 10 per cent. of magnesium, the metal obtained is hardly to be distinguished from aluminum; but when the alloy is passed several times through a flattening mill, heated each time toward 400-500° C., its principles are modified. The alloy cuts and files well, as though it were charged with magnesium, while preserving the ductility and malleability of pure aluminum. Edmund O'Neill finds that he can produce potassium cyanide from the atmosphere. He uses simple apparatus, and by subjecting the vapor from petroleum or coal to the influence of an electric ore he obtains hydrocyanic acid, which, when heated with potash, rapidly yields potassium cyanide. The cheapness of the materials and the simplicity of the apparatus combined with the saving in energy possible in this operation are factors that give the new process a tremendous advantage over all others now in use, and in consequence the new method will cause a great reduction in the cost of extracting gold by the cyanide process and in similar metallurgical operations. A process for using peat fibre has been discovered in Germany. The vegetable fibres are first isolated, and then treated with acids and alkalis, the result being a peat wool consisting of nearly pure cellulose, which is soft, elastic, and capable of being spun in the same way as sheep's wool. A new method of storing acetylene gas for lighting purposes has been introduced in France, which is absolutely free from danger of explosion. It is based on the solubility of acetylene in acetone, and makes it possible to obtain an accumulation of the gas in portable receivers at much less pressure than liquefaction necessitates, thus diminishing the dangers due to the liquefied gas whose pressure at 37° C. is 68 atmospheres. A new high explosive named marsurite has been invented, which possesses, it is claimed, special merit from the fact that it is insensitive to shock, concussion, heat, or cold, and can be exploded only by means of an electric fuse.

Physiological Chemistry.—The theory that nervous action could be explained by electrochemical laws has received more favorable commendation from physiologists than from electricians. In time, physiologists will discover the fundamental laws—perhaps very simple in character, but no doubt very complex in superposition—which underlie nerve action, and the objective side of consciousness. There can be no doubt that electricity takes a share in this action, because all the phenomena of life are phenomena of differentiated liquids separated by thin septa, and it would be practically impossible to assemble such a mechanism without originating electric and electrochemical actions. The recent studies of T. B. Aldrich seem to show that adrenalin is the active principle of the suprarenal gland. W. Jones and G. H. Whipple have shown that the nucleoproteid of the suprarenal is a thymonucleoproteid and probably not a nucleohistone. W. D. Halliburton in commenting on the recent rapid growth and great importance of chemical physiology cites among the more valuable of recent investigations the work of Loeb on the value of ions in fertilization, the knowledge gained of the constitution of the proteid molecule; the discoveries of Pawlow on the various digestive secretions; and the theories of Ehrlich and his colleagues on the subject of immunity towards toxins. At the close of the year the announcement was made that the well-known antiseptic formalin had been successfully used as a cure for sepsis or blood poisoning. The so-called "holy shroud" or traditional winding sheet of Christ preserved in Turin, Italy, since 1353, was carefully examined by Professors Delage, Vignon, and Colson, who reported to the Academy of Sciences in Paris, their results essentially as follows: The winding sheet has on it certain markings printed in a brown color which when photographed give a white imprint, as does a negative when printed from. These markings, therefore, act as a true negative, and it was found by certain very careful experiments that cloth impregnated with oil and aloes, as was the winding sheet in question, will receive an impression when in contact with ammoniacal vapors such as would be given off from a sweat very rich in urea, as is the case in the sweat of a person dying a lingering and painful death. Concerning the sheet itself, they say: The impression of the head is excellent. The wounds produced by the crown of thorns and the marks of the blood drops are quite obvious. The wound in the side and even the marks of the stripes produced on the back by the flagellation are also quite evident. Each of these stripes has at its end an enlargement such as would be produced by a cord with a ball of lead at the end. It is well known that this form of scourge was employed by the Roman soldiers, and such a one has been found at Pompeii. Finally, the marks of the nails in the arms are not in the palm of the hand, but show that the nails were driven through at the level of the wrist. This report is of peculiar interest,

as it presents a set of new phenomena, giving distinct indications of the existence of emanations hitherto not recognized from both animate and inanimate bodies. The discovery of these emanations has been due to the fact that they affect the sensitized silver film, but there is no doubt that there is a very large number of substances also which are affected in a similar way, though not to the same degree as silver in the presence of aluminous substances.

The deaths among chemists have been many during 1902, and include Sir Frederick Augustus Abel (September 6), eminent for his researches on explosives, and a past president of the British Association for the Advancement of Science; Albert Horatio Gallatin (March 25), long professor of chemistry in the New York University; John Hall Gladstone (October 6), for many years professor of chemistry in the Royal Institution, and a past president of the London Chemical Society; John Glover (May 1), the inventor of the Glover tower used in the manufacture of sulphuric acid and other improvements in chemical processes; James Hartford (June 13), a large manufacturer of aniline colors and other chemicals in Buffalo; Robert Hasenclever (June 23), a German technical chemist of high standing, and the inventor of numerous improvements in the alkali manufacture; John James Hummel (September 13), an accepted authority on the chemistry of dyeing, and author of text-books on that subject; Robert Clark Kedzie (November 7), for forty years professor of chemistry in the Michigan Agricultural College; Albert Ripley Leeds (March 13), for thirty years professor of chemistry in the Stevens Institute of Technology; William Manuel Mew (September 19), for thirty years chemist to the medical department of the United States Army in Washington; and Henry Morton (May 9), president of the Stevens Institute of Technology, and author of researches in uranium salts.

The first number of the *Chemical Trade Review* was published in Philadelphia in February, 1902.

CHESS. There was the usual activity in chess circles during 1902 and the various tournaments were held with great success. The annual international cable match of ten games between the United States and Great Britain was won by the former with a score of 5½ games won and 4½ lost. Of the seven cable matches thus far held, the United States has won four, Great Britain has won two, and one has resulted in a draw. Yale won the American intercollegiate tournament with 7½ victories and 4½ defeats, followed by Columbia with 6½ games won and 5½ lost, Harvard with 5½ won and 6½ lost, and Princeton with 4½ won and 7½ lost. The fourth annual international intercollegiate cable match between the American universities, Harvard, Columbia, Yale, and Princeton, and the English universities of Oxford and Cambridge, was for the first time won by the Americans, who scored 3½ of the 6 games played. Of this series the English players have now won two, one has been won by the Americans, and one has been drawn. Cornell won the tournament of the Tri-Collegiate Chess Association over the University of Pennsylvania, winning 4½ of the 6 games played. Brown, the other member, was unrepresented in 1902. The Oxford-Cambridge match resulted in a draw, each side winning 3½ games. In February, 1902, the International Masters' Tournament was held at Monte Carlo. Herr Lasker did not attend, but nearly all of the other great experts participated, and the play was closely contested and brilliant. Maroczy, of Budapest, captured the first prize, winning 14¾ out of the 19 matches, only ¼ game more than Pillsbury, the American expert. The other contestants, with the number of games won, were as follows: Janowski, 14; Teichmann, 13¾; Schlechter, 12; Tarrasch, 12; Wolf, 12; Tschigorin, 11½; Marshall, 11; Gunsberg, 10¾; Napier, 9½; Mieses, 9¼; Mason, 9; Albin, 8½. The second masters' tournament of the year, held at Hanover during July and August, was won by Janowski, of Paris, with 13½ victories in the 17 rounds of play. Pillsbury finished second with 12 games won, and was followed by Atkins, 11½ games; Mieses, 11 games; Napier, 10 games; Wolf, 10 games; Tschigorin, 9 games; Olland, 8½ games; Marshall, 8 games; Swiderski, 8 games.

CHESTERTON, GEORGE K., author of *The Defendant*. See LITERATURE, AMERICAN AND ENGLISH.

CHICAGO, UNIVERSITY OF, at Chicago, Ill., founded 1890. President, William Rainey Harper, LL.D. The year 1902 was one of notable expansion in the work and the organization of the university. The school of law was endowed, organized, equipped, and opened for work. A three-years' course of study is provided with an entrance requirement equivalent to three years of collegiate study. This is a standard fully three years higher than that held by any other law school west of New York. Consequently a large attendance is not anticipated for some years, that for the opening quarter being 80. The work of this school will be carried on through the entire year. A sum of \$300,000 was pledged for a building and the work of construction has been begun. A large and exceedingly valuable library was collected previous to the opening of the school. The medical school completed one year in its

NEW LAW SCHOOL BUILDING, UNIVERSITY OF CHICAGO

university quarters. The standards of admission have been raised until they represent approximately the completion of the freshman year in college. Within two years an additional year of preparation will be required, thus placing the medical school on the basis of the work of the Junior College, and fully two years in advance of any other school west of New York. The attendance in the two years of the medical school, given on the university campus, was 222; that of the entire medical school was 622. The trustees of the Rush Medical College have proposed a complete amalgamation, offering to turn over the entire plant and privileges of the college to the trustees of the university and to furnish an endowment of \$1,000,000 before July, 1903. The school of education has been organized, consisting of the old department of education, the faculty of philosophy, and the faculties of the Laboratory Elementary school, the South Side Academy, and the Chicago Manual Training School. The vacancy occasioned by the death of F. W. Parker was filled by the promotion of Prof. John Dewey to the headship of the school. A plant and buildings costing \$600,000 are in course of erection. The school of technology has received tentative shape, and the gift of \$1,000,000 made by Mr. John D. Rockefeller at Christmas, 1902, is to be used largely as an endowment fund for this school. A separate faculty was constituted for the school of commerce, with the expectation that the work of this department would take a more definite form and a more technical character in the near future. The press building has been completed and occupied by the press division and temporarily by the library. The press division conducted a business of over \$266,000 for the calendar year 1902. The decennial publications, originally announced as six volumes, have expanded into twenty-seven, and have begun to appear. Hitchcock Hall was also added to the plant of the university, while the Commons, the Student Club House, and the Assembly Hall have been enclosed. The most discussed action of the university in 1902 was the segregation of the women of the freshman and sophomore years in the women's quadrangle, and the giving of instruction in distinct classes for the women and for the men in these two years. There was no abandonment of coeducation, and the limited action taken only affected the younger class of students. A scheme of faculty pension was announced. The total attendance for the year on the three-quarter basis, including all the schools, was 4550. The total gifts for the year 1901-02 were \$2,666,354. The gift of Mr. Rockefeller of \$1,000,000 at Christmas, 1902, was in addition to this. See *PSYCHOLOGY, EXPERIMENTAL* (paragraph University of Chicago).

CHILD LABOR. The census reports return 168,624 children as employed in manufactures throughout the country, a gain of 39.5 per cent. over 1890. Child labor has increased in twelve of the factory States, remained stationary in two (Michigan and New Hampshire), and decreased in five States. The increase in Wisconsin was 193.5 per cent.; in Washington, 103.8; in Illinois, 92; in New Jersey, 51.4; in Pennsylvania, 47.8; and in Massachusetts, 44.9 per cent. South Carolina increased the number of children employed by 270.7 per cent.; Alabama by 143.8; North Carolina, 119.2; and Georgia, 81 per cent. Children number 17.5 per cent. of the factory workers in South Carolina and 14.6 per cent. of those in North Carolina. Private investigators put the proportion much higher, Professor Robbins estimating it at 25 per cent. for North Carolina, and somewhat more for the rest of the Southern States. The proportion is much larger for the textile industries. The census figures for cotton manufacturing put the proportion of children working in cotton mills in Alabama at 29.2 per cent., in South Carolina 26.8 per cent. The whole number of children employed in the cotton goods industry was 39,866, a gain of 70.1 per cent. over 1890. Silk and jute manufacture in Pennsylvania have 20.2 and 26.2 per cent. of child laborers respectively. Tobacco manufacturing in the South employs a large percentage of children. In the glass industry of Pennsylvania and New Jersey 14 and 15.7 per cent. of the workers are children. There is no uniformity in legislation in the different States. Thirty-six States and all the territories have imposed some restrictions on child labor. Only twenty-six of these, however, apply to factory work; the rest merely restrict the employment of children in mines. Twelve States put the age limit at fourteen years, one makes the limit fourteen years for girls and twelve for boys; two put it at thirteen, seven at twelve, and four (New Hampshire, Vermont, Nebraska, and California) permit employment of children ten years old. Most of the agricultural States and the States of the new "industrial South," have no limitations whatever on child labor, except Alabama, which prohibits employment of children under twelve in mines. In the southern factories children from eight years up are employed for eleven to twelve hours daily in the factories at from ten to forty cents a day, only the older and more experienced children earning thirty cents or more. In many instances actual earnings are far below these extremely low figures because of deductions made for various things, chiefly transportation. The average wages of children have decreased from 32 cents to 29 cents a day. In some places in the South nine cents is the daily wage for twelve hours' work. One of the reformers in Alabama says that mills are run for thirteen hours with but twenty

minutes for dinner, and during the rush season are often run until 9.30 or 10 o'clock at night. The campaign for securing adequate factory laws to protect childhood was vigorously pushed during 1902. The Democratic platforms in both South Carolina and Texas demand the prohibition of factory labor for children under twelve. The Virginia legislature is considering a law prohibiting the labor of children under twelve and regulating that of children between twelve and fourteen. The Georgia legislature, however, which meets but once in four years, adjourned without taking any action. This will spur the reformers in Alabama to renewed exertions, as the legislature in that State also meets only once in four years. Some employers assert that the children are better employed in the mills, where they can earn something to help support the family, than they would be idling about. Public opinion at the South is not favorable to restricting the labor of children. The selfishness of the manufacturer who wants to get cheap and abundant labor is not so culpable as the greed of fathers who lie and use every effort to force their little children into the factories. As the operatives are drawn mostly from the mountaineers and poor whites, even the barrenness and drudgery of the factory-town life are a distinct improvement, in some respects, over the old life. It is urged that a law compelling attendance at school for half a day and allowing work in the mills for a few hours per day would be the best solution of the problem. Apart from this indifference of public opinion in the South, northern capitalists and mill owners are largely responsible for this shameful exploitation of childhood.

This state of affairs is not peculiar to the South. The appalling extent and disgraceful conditions of child employment in mines, factories, and sweatshops throughout the country were repeatedly brought to public notice during the year. The coal strike commission discovered not only that very young children are employed in the mines and breakers, but that many children of miners are employed in silk mills on night shifts for a bare pittance. According to the reports of factory inspectors, which notoriously fail to give anything like full returns of the number of children actually employed, 9,000 children under fourteen years of age were employed in Massachusetts in 1902, 16,000 in New York, 20,000 in Illinois, and 35,000 in Pennsylvania; the figures for Pennsylvania do not include boys employed in the coal mines. The inspectors for Illinois report that the number of children working in establishments under their inspection doubled from 1897 to 1899. Some manufacturers of high-priced candies in Chicago compel mere children to work from 7.30 A.M. to 9.30 P.M. The New Jersey State Bureau of Factory Inspection reported that in 1900 5,968 children under sixteen were employed in factories. The United States Census reported 8,042 for the same year and State in manufacturing industries alone. It is not to be supposed that the census figures include more than a large minority of the actual number of children employed, for the returns were made at the will of the manufacturer, who cannot know the facts, in many cases, and has a strong motive for concealing them if he does know them. In nine towns in which the factory inspectors could find no children employed, the census inquiries found 510, while in four towns, reported in the census as employing no children, the inspectors report 196. During the glass-blowers' strike, it was brought out that little children were habitually apprenticed to glass-blowers as helpers by so-called orphans' homes and child-placing societies of Pennsylvania and New Jersey, and that a combination of the padrone system and veritable child slavery exists. The labor unions have taken the matter up, and it has been found that in the silk and textile mills of Passaic County, and the tobacco and cigar factories everywhere, children are employed for long hours, frequently at night, and under most unwholesome sanitary conditions. The aroused public opinion has compelled the factory inspectors to make strong efforts to enforce the law. A special committee of the University Settlement in New York City investigated conditions of child labor in the city and discovered the most flagrant violations of the law and of common decency. The committee pointed out the following defects in the present child labor law in New York State: (1) The direct employment of children is prohibited; yet, if accompanied by an adult member of the family to whom the wages are paid, a child may be employed, though the child's name does not appear on the pay roll; (2) children are required to attend school where certain branches are taught, but no study is prescribed; (3) the ten-hour law for children over fourteen allows any day to be lengthened provided a shorter day is made of Saturday; (4) vacation work is allowed to children over twelve, rendering it difficult to return them to school when it opens; (5) the definition of factory and mercantile work is incomplete. The law does not include the thousands of children employed as newsboys, bootblacks, peddlers, office boys, messengers, telegraph boys, and delivery boys for express companies. The condition of the delivery boys seems to be the worst. The committee investigated the case of an express company which employed children of eleven years and upwards from seven in the morning till nine or ten at night. On Fridays and Saturdays they work until midnight, and, if all the packages are not delivered at midnight on Saturday, the boys

must work on Sunday until everything is finished. The conditions of work, wages, and living are such that the *Memphis Commercial-Appeal* says: "Compared to this the child slavery of the South is the greatest freedom." Both Kentucky and Kansas passed laws prohibiting the labor of children under fourteen years in factories.

Foreign.—In Europe legislation to protect children has progressed far. England has had a half-time factory and school law for children of nine and over since 1844, the half-time age having since been raised to eleven; and a fourteen-year age limit for full-day work since 1874. In Germany, the limit for full-day work is fourteen, and for any factory work at all, thirteen years. In Holland, Belgium, France, Austria, Norway, and Sweden the limit is twelve; in Russia fifteen, half time being allowed from twelve up; in Switzerland, fourteen; in Denmark fourteen, with half time from ten up. In Italy the limit was nine years, but in 1902 it was raised to twelve years in most cases. The enforcement of the labor laws in European countries is much better than in America. Few violations are reported and these are usually dealt with promptly.

CHILDREN'S AID SOCIETY, of New York City, was organized in 1853 for the education of poor children, housing them in lodging houses, and procuring homes for them, when desirable, in rural districts. The following figures are for 1902: in the industrial schools 16,364 children were taught and partly fed and partly clothed; 19,427 visits were made by the teachers and visitors to the homes of the children, and practical relief was given to poor families embracing 9,452 individuals; in the kindergarten there was an average daily attendance of 2,105, and in the classes for crippled children 224 helpless little ones were conveyed each day between home and school in wagonettes. The lodging houses sheltered 4,226 boys and girls; through the emigration and placing-out department 474 children were provided with country homes and 247 placed out at wages, and 242 runaway children were restored to their friends or relatives. Unemployed and destitute families, numbering 712 persons, were assisted to friends or employers in the country, 645 boys received training at the farm school, 1,486 children were aided through the sick children's mission, and the number benefiting by the fresh air fund was 21,374. Total number of beneficiaries during the year, 55,222; receipts and expenditures balanced at \$543,109.97. President, William Church Osborn; secretary, C. Loring Bracc, United Charities Building, New York City.

CHILE, a South American republic extending between the Andes and the Pacific from Peru to Cape Horn. The capital is Santiago.

Area, Population, and Education.—The area of Chile, without taking into account the rectification of the boundary pursuant to the arbitration decision of November, 1902, is estimated at about 267,000 square miles, and the population, at the end of 1900, about 3,128,000, exclusive of perhaps 50,000 Indians. The state religion is Roman Catholicism. Public instruction is free, but not compulsory. Secondary, higher, and professional schools are maintained. In 1900 there were 1,547 public primary schools with an enrollment of 113,863 pupils; in 1901, 1,700, with an enrollment of 124,265.

Government.—The executive authority is vested in a president, who is assisted by a council of state and by a responsible ministry. The president for the five-year term ending September, 1906, is Señor Jerman Riesco. The legislative power devolves upon a congress of two houses, the senate and the chamber of deputies.

Army and Navy.—The standing army in 1901 was fixed at a maximum of 17,385 men, while, under the military law of 1900, 400,397 were liable to service. The fleet has been reported to comprise 5 armor-clads, 2 second-class cruisers, 2 third-class cruisers, 15 first-class torpedo boats, 4 second-class torpedo boats, and 11 gunboats. In 1902 three new torpedo boats were added and a battleship of 11,800 tons was nearing completion. For the equalization of the Chilean navy with the Argentine, agreed upon in 1902, see the paragraph Chile and Argentina.

Finance.—The nominal monetary standard is gold, and the unit of value the peso, worth 36.5 cents. On July 30, 1898, the president was authorized to issue 50,000,000 pesos in paper, the conversion of which was to begin January 1, 1902; but on December 31, 1901, a law was promulgated postponing the commencement of metallic conversion to January 1, 1905. By the same law the president was empowered to coin, during a period of two years, not more than 4,000,000 pesos. Ordinary revenue and expenditure in pesos (36.5 cents) are reported at 94,791,398 and 93,431,380 respectively for 1899, and 103,965,030 and 104,730,054 respectively for 1900. The budget for 1902 showed estimated revenue and expenditure of 96,950,000 pesos and 95,850,000 pesos respectively. The largest estimated receipts were: Nitrate (export) duties, 48,000,000 pesos; import duties, 26,000,000; railways, 15,000,000—the largest estimated expenditures: Railways, 19,875,624 pesos; department of finance (principally interest on public debt), 19,625,458; war, 13,033,481; department of the interior, 11,585,327; marine, 11,120,326. The import and export customs receipts for 1900 are reported at 78,467,461 pesos, and for 1901 69,560,333 pesos. On December 31, 1900, the external

debt amounted to £17,230,680 (229,742,400 pesos), and the internal debt, including some municipal debts charged to the state, 75,826,488 pesos—total, 305,568,888 pesos. On December 31, 1901, the external debt was reported to stand at 227,234,400 pesos, and the internal debt 75,437,881 pesos. The figures given here for internal debt include Chile's paper money.

Industries and Commerce.—The principal industries are agriculture and mining, and the most important product is nitrate of soda. Practically the world's supply of nitrate comes from Chile. The industry is controlled by an association which was formed in November, 1900, to limit the output, maintain prices, and dispose of the product through one general agency. Although this association comprised, in 1902, about 100 nitrate works, it distrusted the future of the industry, fearing that the establishment of new works, outside its control, would cause a disastrous increase in production.

The total values of the imports and exports in pesos (35.5 cents) are stated as follows:

	1898	1899	1900	1901
Imports.....	103,262,058	106,260,358	128,538,142	139,300,766
Exports.....	168,069,481	163,106,183	187,674,636	171,844,976

The principal imports are coal, cotton, and woollen goods, iron and steel goods, paper, and (in 1901) wheat. The values in pesos of the principal exports in 1900 and 1901 respectively are reported as follows: Mineral products, 147,783,276 and 158,944,207; agricultural products, 5,831,098 and 4,684,318; animals and animal products, 3,989,659 and 4,340,191; and manufactures, 3,297,902 and 3,462,137. Next to nitrate the leading export is copper bullion. These exports in metric tons with values in pesos, are stated as follows:

	Nitrate of Soda.		Copper Bullion.	
	Metric Tons.	Pesos.	Metric Tons.	Pesos.
1898.....	1,294,227	90,975,297	20,600	13,780,483
1899.....	1,380,718	96,650,282	17,311	14,928,273
1900.....	1,465,935	109,915,150	20,340	17,899,200
1901.....	1,291,958	118,360,181	24,480	19,027,114

Other important exports are iodide, coal, gold, silver, copper ore, barley, leather, wool, and honey. In 1901 the imports from and the exports to countries of greatest trade importance were (special commerce): Great Britain, 42,482,000 pesos and 123,236,000 pesos respectively; Germany, 34,322,000 and 20,227,000; United States, 12,000,000 and 6,387,000; France, 9,290,000 and 7,970,000; Peru, 6,715,000 and 1,675,000; Australia, imports, 9,313,000.

In 1902 there were reported 2,880 miles of railway in operation.

Political.—During 1902 there were several changes in ministry. The new cabinet formed in the latter part of November had Señor Domingo Amunátegui as minister for foreign affairs and Señor Fernandez Albano as minister of the interior. Apparently the most noteworthy ministerial change in 1902 was the resignation of the Tocornal cabinet in April and its supersession by a cabinet formed under Señor Lazo. The Tocornal ministry resigned on account of the general dissatisfaction with its action, alleged unconstitutional, in borrowing from the conversion fund to pay for newly acquired armaments.

A drastic liquor law passed at the end of 1901 and going into effect in 1902, provided for the licensing of distilleries, the prohibition of all alcohols that are not ethylic or vinous, for the severe restriction and supervision of the retail trade, and for punishment for drunkenness.

Chile and Argentina.—A new boundary dispute with Argentina arose in the autumn of 1901. This concerned the region of Ultima Esperanza, in the far south, and did not fall within the jurisdiction of the British commission already appointed to settle an Argentine-Chilian boundary controversy in pursuance of agreements of April, 1896, and September, 1898. Toward the end of 1901 not a little bitter feeling had developed between the two countries, but on December 25 a protocol was signed submitting the dispute to the arbitration of the British government. In January, 1902, on behalf of the existing boundary commission, Sir Thomas Holdich went to Ultima Esperanza to examine the geographical conditions. Finally on May 28, 1902, a general arbitration treaty was signed at Santiago by Señor José Francisco Vergara Donoso, Chilian minister for foreign affairs, and Señor José Antonio Terry, Argentine minister to Chile. The treaty provided for the submission to arbitration of all questions arising between the two governments and impossible of direct

settlement, in so far as such disputes should not affect the constitution of either country. The arbitrator named was His Britannic Majesty, or, in case either of the high contracting parties should sever its friendly relations with Great Britain, the government of the Swiss Confederation. The treaty was to remain in force for ten years from the date of exchange of ratifications and was to be renewable. At the same time (May 28, 1902) two other agreements were signed by the plenipotentiaries named above: the one provided for renouncing, on the part of both governments, the acquisition of war vessels in the immediate future, and for negotiations looking toward a "prudent equilibrium" between the two fleets; the other agreement provided that the general arbitrator between the two countries (His Britannic Majesty) be requested to appoint a commission to mark on the ground the boundary lines that the arbitral decision might establish. Ratification of these conventions by the two governments was completed by August 12, 1902.

This consummation relieved a tension that had existed for many years. War or even continued unfriendly rivalry between the two countries would have been to the detriment of both. Aside from heavy indemnities, the military success of one over the other would probably mean the loss to Argentina of her Patagonian territories or the loss to Chile of the provinces acquired from Bolivia and Peru as the outcome of the war of 1879-82, as well as the loss of her southern territory. The development of both countries depends largely on the introduction of foreign capital. Such capital amounting to nearly \$600,000,000 has already been invested in Argentina, and a smaller though still very considerable amount in Chile. The major portion in each case is British. It is highly probable that the assurance of peaceful relations between the two countries will attract much more foreign capital and serve as an effective aid to industrial progress. It should be pointed out, however, that, although the agreement for the limitation of naval armaments goes far to dispel doubt of the pacific intentions of the two governments, the exception from arbitration of questions "affecting the precepts of the constitution of one or the other country" leaves an opportunity for future complications should either government wish to evade the spirit of the treaties.

The boundary award of the British commission was made on November 20, 1902, in the name of King Edward. This closed a dispute which had existed for many years and upon which the arbitrators had been engaged for three years. Of the disputed territory Chile received about 55,000 square kilometres and Argentina about 40,000 square kilometres, but Argentina got the larger share of fertile land. (The square kilometre equals .386108 square mile.) The decision was received with little apparent disfavor in both countries. The general boundary dispute arose from a treaty that defined the line of frontier as following the summits of the Andes and the continental water-divide. But in many cases the line of summits does not coincide with the line of water-parting; many rivers rise east of the Andes and flow westward through cuts in the mountains to the waters of the Pacific. It was thus impossible for the boundary commission to follow either water-shed theory, and accordingly its decision was a compromise "between opposing views of physical geography and awkward accomplished facts of possession and occupation." Thus the new frontier is partly physical and partly political. The boundary report was submitted to King Edward by Lord Macnaghten, Sir John Ardagh, and Sir Thomas Holdich, members of the arbitration commission. The text of the King's award was as follows:

"The boundary in the region of the San Francisco Pass shall be formed by the line of water-parting extending from the pillar already erected on that pass to the summit of mountain Tres Cruces. The basin of Lake Lacar is awarded to Argentina. From Perez Rosales Pass, near the north of Lake Nahuel Huapi, to the vicinity of Lake Biedma, the boundary shall pass by Mount Tronador, and thence to the River Palena by the line of water-parting determined by certain obligatory points which we have fixed upon the rivers Manso, Puelo, Fataleufu, and Palena (or Carrenleufu); awarding to Argentina the upper basins of those rivers above the points which we have fixed, including the valleys of Villegas, Nuevo, Cholila, Colonia de 16 Octubre, Frio, Huemules, and Corcovado, and awarding to Chile the lower basins below these points. From the fixed point on the River Palena, the boundary shall follow the River Encuentro to peak Virjen; thence to the line which we have fixed, crossing Lake General Paz; thence by the line of water-parting determined by the point which we have fixed upon the River Pico; from whence the boundary shall ascend to the principal water-parting of the South American continent at Loma Bagues, and follow that water-parting to the summit known as La Galera. From this point the boundary shall follow certain tributaries of the River Simpson (or Southern Aisen), which we have fixed, and attain peak Apywan, from whence it shall follow the water-parting determined by a point which we have fixed on a promontory from the northern shore of Lake Buenos Ayres. The upper basin of the River Pico is thus awarded to Argentina and the

lower basin to Chile. The whole basin of the River Cisnes (or Frias) is awarded to Chile; also the whole basin of the Aisen, with the exception of the tract at headwaters of the southern branch, including the settlement Koslowsky, which is awarded to Argentina. The further boundary is determined by lines which we have fixed across Lake Buenos Ayres, Lake Pueyrredon (or Cochrane), and Lake San Martin, thus assigning the western portions of the basins of these lakes to Chile and the eastern portions to Argentina, the dividing ranges carrying Mounts San Lorenzo and Fitz-Roy. From Mount Fitz-Roy to Mount Stokes the frontier is already determined. From the vicinity of Mount Stokes to the fifty-second parallel of south latitude, the boundary shall first follow the continental water-parting defined by the Sierra Baguales, diverging from the latter southwards across the River Vizcachas to Mount Cazador, at the southeastern extremity of which range it crosses the River Guillermo and rejoins the continental water-parting to the east of Mount Solitario, following it to the fifty-second parallel, from which point the frontier has already been defined by mutual agreement between the respective States. A more detailed definition of the line of frontier will be found in the report submitted to us by our tribunal and upon the maps furnished by the experts of the republics of Argentina and Chile, upon which the boundary which we have decided upon has been delineated by the members of our tribunal and approved by us. Given in triplicate under our hand and seal at our Court of St. James's, this twentieth day of November, 1902, in the second year of our reign.

"EDWARD, R. & I."

CHINESE EMPIRE, an absolute monarchy of Asia lying between Siberia on the north, and French Indo-China and British India on the south. The capital is Peking.

Area and Population.—No official records of either the area or population of the empire had been compiled for many years previous to 1902, but recent estimates placed the total area at about 4,234,910 square miles, and the population at about 399,680,000. In 1902 an official re-census ordered by the imperial government, in order to facilitate the increase of taxes made necessary by the war indemnity, was completed. By the census of 1902 the area of the eighteen provinces of China proper was placed at 1,532,817 square miles and the population at 407,737,305, and the area of the entire empire at 4,278,374 square miles with a population of 426,447,325. The following table of the results of the census is taken from the *Lloyd de l'Extrême Orient*:

PROVINCE.	Area in Square Kilometres.*	Population.	Population Per Square Kilometre.

*A square kilometre equals .386108 square mile.

The entire foreign population of China, according to imperial customs returns, was, at the beginning of 1901, only 16,811, including Japanese and other Asiatics. The bulk of the inhabitants are adherents of Buddhism, but Confucianism is the recognized state religion, the emperor being its supreme head. The two, with Taoism, constitute the principal religions of China, but there are said to be 30,000,000 Mohammedans, chiefly in the northeast and southwest. The Roman Catholic population is estimated at 1,000,000, and the Protestant population, of all sects, 50,000.

Government.—The supreme head of the Chinese government is the emperor. Succession is not hereditary, but each emperor designates his successor. The present sovereign, Kwang Hsu, born in 1872, was proclaimed emperor through the influence of the Empress Dowager, Tszu-Hszi, in 1875, she acting as regent until 1887. The supreme direction of the imperial government, however, rests in the Chun Chi Ch'u, or grand council, through which it is exercised by the Nei-Ko, or cabinet, of four members. Under the cabinet the government is carried on through an extensive system of boards and councils, all being, in theory, organized with the greatest care for detail and exactness in respect to their powers and duties, but in fact this is far otherwise. Each of the eighteen provinces of China proper is ruled by a viceroy, responsible to the imperial government. The provinces are subdivided into departments and districts.

Army and Navy.—The army of China comprises, principally (1) the national army (Ying Ping), known as the "Green Flags," consisting of eighteen corps, one for each province, and numbering nominally between 540,000 and 660,000 men, although no more than 200,000 are available; and (2) the "Eight Banners," an hereditary force nominally containing 300,000 men, mostly Manchus, and maintained on a war-footing of about 100,000. In addition to these forces, mercenary troops, local militia, and Mongolian and other irregular cavalry, bring the total army strength on a war footing up to about 1,000,000.

The navy of China comprised in 1902 nine cruisers of various sizes, none of them of the first class, four torpedo gunboats, twenty-one torpedo boats and a fleet of twenty-two river gunboats. A considerable extension of the navy, which will add to it a number of effective modern fighting ships, has been planned.

Finance.—There are no official figures obtainable as to the finances of the Chinese Empire, but unofficial estimates, based on figures compiled by British consular officials for the three years preceding the Japanese war (1894) showed that the amount of revenue and expenditure as accounted for by the provincial authorities balanced at about 89,000,000 haikwan taels (1 haikwan tael valued in United States money at 77.1 cents January 1, 1901; 68 cents January 1, 1902, and 59.4 cents January 1, 1903). For the period 1902-10 the imperial authorities, in order to meet the increased expenditure on interest and redemption of the new debt caused by the indemnity, have required the viceroys and governors of provinces to increase their annual contributions by 18,700,000 taels. The receipts of the imperial Chinese customs service, administered under the supervision of European and American officials under the control of Sir Robert Hart, by whom the system was organized, amounted in 1899 to 26,661,490 haikwan taels, and in 1900—the year of the Boxer uprising, which would account for the decrease—to 22,873,986 haikwan taels. In this service over 900 Europeans and Americans are employed.

The land tax annually amounts to about 25,000,000 haikwan taels, and the salt duty and *likin* to about 14,000,000 haikwan taels. The foreign debt, including the Japanese indemnity, is about £55,755,000, or, including the indemnity due the Powers, £123,255,000.

Commerce.—The condition of trade in China at the end of 1901 was vastly better than would be inferred from comparisons of the totals of exports and imports for that year with those of previous years; for during a large part of 1901 conditions were not at all favorable to trade. The revival during the latter part of the year, after the restoration of order, was remarkably rapid and strong. The total export and import trade of China for 1901 was 437,959,675 haikwan taels, a larger amount than any other year except 1899, when it reached 460,533,288 haikwan taels. There was no rush of imports to escape the increased duty except at one or two southern ports, and trade was thoroughly healthy. The value of merchandise imports exceeded the value of merchandise exports by 49,916,706 haikwan taels, and for the first time in many years there was a net export of silver amounting to 6,097,802 haikwan taels, while the net export of gold amounted to 6,635,313 haikwan taels. The remaining balance against China is accounted for by the remittances from Chinese residents abroad, missionary contributions, expenditures by foreign countries on troops and officials, and by investments of foreign capital in railroads and other enterprises, all of which swell the imports of the empire, but do not make necessary any exports to balance the account. The values of imports and exports for 1900 and 1901 by countries are shown in the table below.

The total value of net imports for 1901 was estimated at 268,302,918 haikwan taels, an increase of 57,232,496 haikwan taels over 1900, and more than 3,000,000 haikwan taels greater than in 1899, which surpassed every other year. The imports of opium increased but little because of the increase in the production of native opium. The imports of cotton goods increased by about 24,000,000 haikwan taels. American heavy goods were especially demanded. The imports of American drills were 2,351,479 haikwan taels in 1900, and 4,834,879 haikwan taels in 1901; American sheetings, 6,236,255 haikwan taels in 1900, 7,636,714 haikwan taels in 1901. By far the

most important item in the cotton imports is Indian yarn, which increased from 19,214,514 haikwan taels in 1900 to 35,937,651 haikwan taels in 1901. Japanese yarn ranks next with values of 10,044,515 haikwan taels and 11,297,538 haikwan taels, respectively, for 1900 and 1901. Imports of other cotton goods from Japan also increased greatly. The imports of raw cotton nearly doubled because of the short crop in China. Imports of cigars and cigarettes more than doubled. The demand for American flour continued to increase. One of the chief arguments in the United

States for Chinese exclusion is that they do not spend their earnings in this country but send them back to China. It has been overlooked that these remittances, amounting to more than \$10,000,000 in gold annually, are made in the shape of American products, for which it is to be presumed the Chinese workmen in America have given a fair equivalent. American kerosene oil exceeded by 6,000,000 gallons the record importation of 1894. Russian oil about held its own, while imports of Sumatra oil more than doubled in quantity and nearly doubled in value. Oil from Borneo and Japan appeared in the returns for the first time, suggesting the possibility of two new rivals for the Chinese oil market. Although woolen goods are not used extensively in China as yet, even in the colder parts, still the woolen trade showed a very satisfactory growth during 1901. Of metal imports slab tin is by far the most important, reaching a value of 1,906,658 haikwan taels in 1900 and 2,832,446 haikwan taels in 1901. Nail rods and bar iron come next in importance, with values of 414,445 and 411,272 haikwan taels, respectively, for 1900; and 622,450 and 698,987 haikwan taels for 1901. Machinery was almost the only item showing a decrease of imports—1,450,091 haikwan taels in 1900, and but 1,220,167 haikwan taels in 1901.

The following table gives the principal imports for 1900 and 1901, with values in haikwan taels:

ARTICLES.	Imports.		ARTICLES.	Imports.

The total value of native exports for 1901 was 169,656,757 haikwan taels, an increase of 10,660,005 haikwan taels over 1900, but far below the record year 1899,

when exports amounted to 195,784,832 haikwan taels. The necessity of collecting larger revenue to pay the indemnities makes it desirable to increase both exports and imports. The building of railroads and the abolishing of some burdensome internal taxation in the shape of *likin* have facilitated the development of commerce, but the adulteration of products and the arbitrary exactions of provincial and local rulers prevent a normal growth of industry and commerce. Tobacco of excellent quality is produced in China, and in 1898 the exports were 371,137 piculs (£494,849), but adulteration and fraudulent packing spoiled the excellent prospects of the industry, though it improved greatly during 1902. The export of feathers, once of great importance, was the smallest in 1901 since 1895, and will no doubt continue to decrease unless the Chinese merchants can be prevented from mixing in dirt and low-grade feathers with high-grade feathers. The same complaints of adulteration, dishonesty, and carelessness in preparing products for shipment were heard in every line of trade. Exports of tea fell off, partly because of poor quality and partly because of a short crop, owing to heavy rains in April. Exports of black tea were the lowest on record. Russia took more Indian and Ceylon teas, and the China teas have lost the Canadian and Australian markets because of deteriorated quality and the unreasonably heavy export duty and *likin*, which have raised the cost of low grade teas sometimes as much as 40 per cent. While these conditions continue the trade must continue to decline. It would be easy to relieve the tea trade from some of the burdens of the heavy export duty, as it is the only article of export upon which the duty is at all onerous. The silk trade was very satisfactory in 1901, the principal increase being in steam filature fibre. Raw silk exports increased more than exports of manufactured silk. The first table on the following page gives the principal exports for 1900 and 1901, with their value in haikwan taels.

The total customs revenue for 1901 was 25,537,574 haikwan taels, which has been excelled only in 1899, when the collections amounted to 26,661,460 haikwan taels. Collections from every source were greater than in 1900, and there were increases over 1899 in import duties, coast trade duties, tonnage dues, and transit dues. The total value, expressed in haikwan taels, of the trade of the ports under foreign supervision for 1900 and 1901 is given below, together with the total revenues collected:

24,438 vessels of 17,853,000 tons, as against 27,431 vessels of 14,850,000 tons in 1900. The total tonnage entries and clearances were 48,416,000, and of this Great Britain contributed 54 per cent., Germany 16 per cent., China 13 per cent., Japan 11 per cent., France 2 per cent., America 2 per cent., Russia 1 per cent., and all others 1 per cent. The number of entries and clearances for 1900 and 1901 by nationality of vessels is shown as follows, entries and clearances being about equal :

Railways.—There were in 1902 three separate lines of railway in operation in China proper. Of these that known as the Chinese Imperial Railway, built by British capital, extends from Peking to Tientsin, 80 miles, thence to Tong-ku, 27 miles, and to Shan-hai-kwan, 147 miles distant, on the Manchurian border, 247 miles in all. The other lines are the Peking-Pao-ting-fu Railway, of which the main line is 88 miles long, with a branch 10 miles long; and the short Shanghai-Wusung line, which is only 12 miles long. The total length of these three lines is 364 miles. The two most important lines under construction are the Shantung Railway and the Peking-Hankow line. The Shantung line is being constructed by a German syndicate inland from Kiao-chau. At the beginning of 1902, 160 kilometres were reported as being completed, and it was expected that in three years the road would be completed as far as Chi-nan-fu, the capital of Shantung province. The first section—from Kiao-chau to Weihsien—was completed and opened for traffic on June 1, 1902. Work on the Peking-Hankow line, which is being built by the Belgian syndicate that already controls the Peking-Pao-ting-fu line, was progressing rapidly. The two lines are to be united and run in connection with one another. The section of the road destroyed during the Boxer uprising in 1900 has been rebuilt, and the line carried as far as Cheng-ting-fu, 262 kilometres distant from Peking. Early in the year it was expected that trains would be running from Hankow 220 kilometres northward to Hsin-yang by May (1902), and that 100 kilometres more of track would be laid to the north of Hsin-yang by the end of the year. Other important lines projected in China proper, but not begun, include a line to be built

by an American syndicate from Hankow to Canton, a British-built line from Shanghai to Nanking, and an American and British line to be run between Canton and Wu-chang. Contracts have been let for the construction by a French company of a line 291 miles in length to be run from Lao-kai to Yunnan-sen in south China, there to form a junction with the French Indo-Chinese railroad system (see *INDO-CHINA, FRENCH*). In Manchuria (*q.v.*) the Chinese Imperial Railway has an extension 193 miles in length from Shan-hai-kwan to Niuchwang, where it connects with the Russian-Chinese Eastern Railway. For other railways in Manchuria, see *MANCHURIA*.

HISTORY.

The Return of the Court.—The imperial court, which had been removed from Peking during the occupation by the Powers in 1900, had, by the end of 1901, reached in its return journey the city of Cheng-ting-fu—from which point it proceeded by rail to Peking, making a formal entrance on January 7, with great show and ceremony. It became manifest at once that the empress dowager had learned a lesson from the occurrences of the last two years, and that hereafter an entirely different policy from that formerly prevailing would be adopted by the court toward foreign diplomats. On January 22 the emperor gave an audience to the foreign diplomatic representatives, and received their credentials. More significant, however, was a state reception given by the empress dowager herself on January 28, when both the empress dowager and the emperor informally shook hands with the ministers. On the following day an entirely new departure in court policy was inaugurated in a formal state reception given by the empress dowager to the ladies of the foreign legations, at which Mrs. Conger, wife of the American minister, read a speech to which the empress dowager responded.

Internal Disturbances.—In March a rebellion of serious dimensions was reported near the boundary of southern China. The imperial troops had been repeatedly defeated, and the viceroy of Canton was compelled to call for reinforcements. On March 21 it was reported that the whole army of General Su, on the southern border had deserted to the rebels. On the following day the rebels captured the town and imperial arsenal of Kan-chau. By the first of April the entire province of Kiang-se was in revolt, thirty towns and villages had been captured and pillaged and 50,000 well armed troops were in the field, under the leadership of Dr. Sun-yat-sen, who was said to have studied at Harvard and graduated at a London medical school. The purpose of the rebels was declared to be the overthrow of the Manchu dynasty. For this purpose Dr. Sun and other educated Chinese had several years ago organized a secret political organization known as Hing Chung Wooy (Chinese Progressive Society). In May there was a renewal of the Boxer uprising, especially in Sechwan province. The missions and Christian converts were endangered, several Christian churches were sacked, and on August 6, in response to protests of the foreign ministers, the viceroy and other officials were suspended, but the new viceroy seemed unable to cope with the situation. On September 16 a Peking dispatch stated that between 300 and 1000 converts had been killed by the Boxers. A few days later they made an attack upon the capital, Cheng-tu-fu, but were repulsed, and fourteen leaders of the movement were captured and summarily executed. The uprisings it was said, were due apparently to the mingled hatred of foreigners and discontent at increased taxation.

Evacuation of Tientsin and Shanghai.—By the terms of the protocol of September 7, 1901, the Powers formally agreed that, by September 22 following, China having complied to their satisfaction with the conditions laid down by them, all the international troops should be withdrawn from Chi-li province, with the exception of certain localities where it was necessary to maintain small garrisons to ensure communication between Peking and the sea. Notwithstanding this agreement, however, it was not until August 15, 1902, that the evacuation actually took place. Again and again during these months of occupation, the Chinese government pleaded strongly for the restitution of the Chinese administration in the city and district of Tientsin and the restoration of the northern railways. There was nothing whatever in the protocol to justify this flagrant and open disregard of Chinese rights. Early in January, 1902, it was reported unofficially that the ministers had agreed in principle to accede to the Chinese request that the city be restored, but that the details of the restoration had not been worked out. After that weeks and months passed without any suggestion as to when the Powers proposed to fulfil their obligations. During February and March the British minister, Sir Ernest Satow, in reply to requests addressed to him by the anxious Chinese, replied several times that the British troops were ready to leave Tientsin the moment the other Powers agreed. Suddenly early in April an entirely new phase of the subject developed. The allied military commanders of the six Powers concerned in the occupation (Russia, Great Britain, Germany, France, Italy, and Japan) met on April 12, and, under the presidency of the British commander, looking at the question from a military point

of view, decided unanimously not to restore the city until one month after China had agreed to accept an entire new set of twenty-four conditions, none of which were provided for in the original protocol. These conditions were incorporated in one agreement which was sent to the foreign ministers at Peking for approval, and, with some modifications, was accepted about the middle of June by the representatives of the six Powers whose commanders had joined in the new proposal. The British minister expressed his disapproval of the conditions, but voted for them for the sake of harmony. In commenting on this new check to the long delayed fulfillment of the treaty obligations, the Peking correspondent of the London *Times* voiced the almost universal feeling of disgust and disappointment, and declared that the hope was freely expressed that the United States would insist on such a modification of the conditions as would lead to a speedy evacuation. He rather facetiously concluded: "If she cannot do so, it is suggested, in order to prevent misunderstanding in the future, that final protocols between China and foreign Powers should contain a clause that protocols are binding on China only." The *Times* correspondent's reference to the attitude of the United States was probably more than prophecy. The Chinese government did appeal to the United States to lend its influence toward securing the acceptance of the protocol's provisions, and Secretary of State Hay addressed notes concerning the matter to the home governments of the various Powers. On June 28 the ministers of the six Powers concerned in the provisional government met at Peking to discuss the situation, and M. Lessar, the Russian minister, formally announced Russia's withdrawal from the government and her willingness to return Tientsin to Chinese authority unconditionally. To this decision it was expected that France would give concurrence, and follow the example of Russia, thus leaving Great Britain, Germany, Italy, and Japan responsible. At this meeting the Japanese minister urged the modification of the conditions by the abandonment of the stipulation forbidding the viceroy to employ Chinese troops within thirty kilometres of Tientsin city, as likely to be the cause of great disorder and trouble in the future. On July 9 the representatives of the four Powers met again and formally agreed to the abandonment of this stipulation, together with some other concessions, and on July 17 the Chinese foreign office announced its acceptance of the terms. The previous unconditional withdrawal of Russia was looked upon as another stroke of policy on her part, as she had thus again placed herself in the position of a friend of China against the pretensions of Germany and Great Britain. The London *Spectator* heralded the settlement as another victory for the diplomacy of the United States, whose position, as in the Manchurian affair, had been practically adopted by the other Powers.

In October Germany sent notes to France and Great Britain with whom she jointly occupied Shanghai stipulating the conditions upon which she would agree to a withdrawal from the city. These were (1) that China should undertake not to part with any of her sovereign rights in the Yang-tse Valley; (2) that China should agree not to grant to any Power preferential rights opposed to the principle of the "open door;" (3) that the evacuation should be simultaneous on the part of the Powers; and (4) that Germany reserved the right to re-enter in case any other Power should again occupy the city. To these France and Great Britain offered no objection, Great Britain merely announcing that as to the first of the conditions the British government, not being a party to it, did not consider themselves affected by it one way or the other, but that their position as a champion of the "open door" policy was guarantee enough of their intentions. The city was evacuated by the allied troops on November 23, 1902.

The Indemnity.—The question of the amount and method of payment of the war indemnity continued throughout 1902 as in the previous year to be one of the most puzzling and serious with which the foreign diplomats and Chinese officials had to deal. Up to the end of the year no satisfactory settlement had been arrived at. The principal difficulty seemed to have its origin in the indefiniteness and ambiguity in the wording of the peace protocol of 1901. According to the protocol the 450,000,000 haikwan taels constituting the indemnity, represented a gold debt, calculated at the rate of the haikwan tael to the gold currency of each country according to a table appended to the protocol which placed its value in United States currency at 74.2 cents. The original sum set as the indemnity was to bear interest at the rate of 4 per cent. per annum, and it was expressly provided that the principal was to be paid up in 39 years, and that both capital and interest should be payable in gold, or "at the rates of exchange corresponding to the dates at which the different payments fell due." Since the acceptance of the protocol, however, the rapid and unlooked for fall in silver has resulted in a decrease in the value of the haikwan tael (\$9.4 cents on January 1, 1903) of about 25 per cent., so that the total amount of the indemnity has increased to about 563,000,000 haikwan taels, and China will be compelled to pay an annual sum in interest equivalent to 5 per cent. instead of 4 per cent., with a corresponding addition chargeable to the sinking fund. China

complained that such an increase was unjust. When the February installment of the indemnity fell due the International Bankers' Commission at Shanghai refused to accept it because it fell short of the amount which would have fallen due in accordance with the calculations of the commission at the prevailing rate of exchange. Before this matter could be acted upon the question of a scaling down of the total demands of the Powers was brought up and the United States presented a proposition for a pro rata reduction of the claims. This proposal, after considerable opposition on the part of the British minister, was adopted in June. In the same month Mr. Conger, the United States minister, signified the willingness of the United States to accept payment of the interest and principal of the indemnity without regard to the fluctuations in the price of silver. This view was opposed unanimously by the other ministers. At the same time a further suggestion, supported by Mr. Conger, allowing China to collect customs duties on a gold basis was favorably looked upon, it being recognized that it would be unjust to make the depreciation of silver operate against China both in payment of the indemnity and in the collection of revenues to meet it. No conclusion having been arrived at China refused to pay the July installment of the indemnity except at the rate of exchange prevailing at the time the protocol was signed. Thereupon the British minister offered a compromise provision agreeing that China should be allowed to pay the indemnity in silver until 1910. This was not looked upon with favor by the other ministers as being a practical admission of China's intention. The matter dragged along without further agreement until November 12, when the United States, having already obtained assurances of the support of Great Britain and Japan, submitted to the Powers a proposition for the submission of the question of the payment to the Hague Tribunal. To this Russia and France at once agreed, and Germany's assent was given late in December. Just at the close of the year the announcement was made at Peking that China would be willing to acknowledge her liability to make the payments due on a gold basis if some sort of relief were granted during the present silver crisis.

The Anglo-Chinese Treaty—Toward the close of July, 1902, a treaty was negotiated at Wu-chang between the two Yang-tse viceroys, as representatives of the Chinese government, and Sir James Mackay and two British tariff commissioners, and was signed, after some delays, on September 5. The treaty consisted of 13 articles, which constitute by far the most important commercial agreement that China has ever made with a foreign power. The first seven articles dealt with the registration of trade-marks, the establishment of a system of bonded warehouses, the navigation of the Yang-tse and Canton Rivers, the equalization of the dues on junks and steamers, facilities for drawbacks, the establishment of a national currency, and the liability of Chinese shareholders in joint stock companies. Article 8 provided for the abolition of the *likin*, the internal customs tax. Article 9 agreed that within one year China shall revise her existing mining regulations on the model of the Indian mining regulations in order that no further impediment may be offered to the investment of foreign capital. Article 10 provided new regulations for the navigation of inland waters, which has never been a matter of treaty right, and further, for facilitating the erection of wharves, jetties and warehouses. Article 11 provided for the appointment of a joint commission to settle disputes arising under the treaty, and the last two articles amounted to an expression of Great Britain's willingness to support China's policy of reform and a promise to relinquish extra territorial rights as soon as the reform in the judicial system and the establishment of an effective administration shall warrant her in so doing. Article 8, providing for the most radical and far-reaching reform in the Chinese commercial system yet undertaken, is the keystone of the whole treaty. The *likin* tax, established shortly after the Tai-ping rebellion, has long constituted the greatest barrier to the opening up of China to the trade of the outside world. It is an arbitrary customs charge, levied at intervals along the inland trade routes, and by the frequency of its enforcement has amounted to an extortion that has practically rendered the development of internal trade impossible. By this section of the Mackay treaty it is provided, that in return for a surtax equivalent to one and one-half times the duty leviable in accordance with the protocol of 1901, which duty slightly exceeded 4 per cent. *ad valorem*, China shall abolish all *likin* dues, internal customs stations, and barriers, and every form of taxation on British goods, the article to become effective in January, 1904, subject to other Powers entering into similar engagements. The consent of the Powers, however, is not to be dependent upon any separate exclusive concessions by China. It is further agreed that four new treaty ports shall be opened—Chang-sha, Ngan-king, Wan-hsien, and Wai-chau. China is to be allowed to retain the right to tax salt, opium, and native produce for native consumption, but the collection of these charges will be taken out of the hands of the local and provincial authorities and placed, hereafter, in charge of the officials of Sir Robert Hart's service. To China was conceded the right to recast the existing export dues

at six months' notice, providing duties not exceeding 5 per cent. *ad valorem*, a surtax of 2½ per cent. being leviable in lieu of all internal taxation. The treaty was generally conceded to be a striking proof of the real desire of the Chinese imperial government and of the Yang-tse viceroys in particular, to adopt radical measures of fiscal reform and establish a system of foreign trade on a basis similar to that recognized by other civilized nations.

The Control of the Northern Railways.—An agreement was signed at Peking on April 29, 1902, by Sir Ernest Satow, the British minister, and Hu Yu-fen and Yuan Shi-Kai, providing for the restoration of the Peking-Shan-hai-kwan Railway to Chinese civil administration, and stipulating the regulations which should govern its control and extension in the future. The agreement was designed principally for the purpose of enabling the Chinese government itself to control and keep in its own hands all the railway lines and extensions in the metropolitan province. On May 20 China formally submitted the agreement to the foreign ministers and asked their consent. The terms of the agreement provided for the appointment of a commission of one British military official as director and two assistant directors, one German and one Japanese, and stipulated among other things that no foreign Power shall construct or control any railway line within 80 miles of the Peking-Shan-hai-kwan system. To these clauses both Belgium and Russia lodged objections. The protest of Belgium rested on an alleged promise of Li Hung Chang made, it was said, in 1901, allowing the Belgium syndicate controlling the Peking-Hankow line to construct and control the Peking-Pao-ting-fu extension. The Russian protest, lodged by M. Lessar, the Russian minister, objected to the stipulation which would have the effect of preventing Russia from controlling the line northward from Peking to the Great Wall on the ground that prior secret agreements entered into between China and Russia would be thereby violated. The other Powers, with these two exceptions, accepted the agreement, and an amicable adjustment of the differences having been arrived at by the abandonment of the plan for a military directorship, the British-controlled section of the Northern Railway was restored to Chinese authorities on September 29 and the Russian Kin-chow-Niu-chwang section on October 8. The agreement stood practically as originally adopted in April, and a difficulty that promised to be the source of considerable trouble was thereby overcome.

Commercial and Industrial Affairs.—In June, 1902, a valuable mining concession in Yunnan province was granted to an Anglo-French syndicate. The concession was for a term of 60 years, and comprised 85 miles located on rich mineral lands bearing deposits of coal, copper, nickel, tin, and quicksilver, and covering in extent almost one-third of the entire province. The mines are all near the course of the projected railway from Indo-China to the city of Yunnan. A royalty of 5 per cent. is to be paid to the Chinese government, which is to receive also 25 per cent. of the net profits. An additional 10 per cent. of the net profits is payable to the provincial government. It was expected that two rival French and English syndicates, each of which is seeking similar concessions in Szechwan province, would effect a union of interests in the same manner that the Yunnan syndicate has done. In July an edict was issued providing for the completion of the Canton-Hankow Railway, and authorizing the issue of \$40,000,000 in gold bonds. It was stated that the completed railway would comprise 700 miles of trunk line and 200 miles of branch lines.

The New Tariff.—During 1902 commissioners from Germany, Great Britain, Japan, and the United States negotiated with Chinese officials a new tariff which became effective on October 31. The negotiations had in view the compliance with the protocol of September 7, 1901, which provided that the tariff on imports should be increased to an effective 5 per cent. and that all *ad valorem* duties should be converted, as far as feasible and with the least possible delay, into specific duties. The basis upon which this conversion was to be effected was to be the average landing value of merchandise for the years 1897, 1898, and 1899—i. e., the market price less the amount of existing import duty and incidental expenses. Upon this basis the tariff was arranged, it being provided that all imports not enumerated in the schedules should pay duty at the rate of 5 per cent. *ad valorem*. In signing the draft of the tariff the United States, German, British, and Japanese negotiators submitted the following accompanying note:

"We, the special commissioners of Germany, Great Britain, Japan, and the United States of America, in affixing our signatures to the new Chinese specific tariff, wish it to be clearly understood, in view of the fact that the special commissioners of other countries are only empowered to sign the tariff subject to reference to their respective governments and that other powers have not appointed representatives to sign it, that no alterations can hereafter be made in the said tariff or rules appended thereto by agreement between China and any other power, unless the consent of our governments to such alterations shall first have been obtained."

Other Political Matters.—New Chinese ministers to Russia, France, Italy, and the

United States were appointed. The new American minister was Sir Liang Chen, secretary to the British coronation embassy. The appointments seemed to indicate that the empress dowager continued to regard the diplomatic service as of little importance since none of the new ministers held high rank or had served in high official positions. On the other hand, it was said that they all were men of progressive views and accordingly were disliked by the Chinese official class. In February, 1902, it appeared that the British government had definitely abandoned the idea of fortifying Wei-hai-wei. A civilian official, Mr. Stewart Lockhart, was appointed administrator and the territory was placed under the control of the British colonial office. It will be remembered that immediately after the Germans secured Kiaochau and the Russians Port Arthur, Great Britain obtained Wei-hai-wei in order to continue the traditional balance of power in northern China. It was proved, however, that the territory is strategically unfit for the purposes of a great naval or military station. It will probably be used by the British as a place for rifle practice and, it is thought, may in time become important commercially as a distributing centre. In August it was announced that Charles Denby, Jr., son of the former United States minister to China, had been appointed chief foreign adviser to Yuan-shi-kai, the viceroy of Chi-li province, which contains both Peking and Tientsin. As Yuan is considered the real successor of Li Hung Chang, this appointment was thought to mean an increased influence of the United States in Chinese affairs.

CHOLERA. See VITAL STATISTICS.

CHRISTIAN AND MISSIONARY ALLIANCE, established in 1887 for the "wide diffusion of the gospel and the work of evangelization." It conducts missions in both foreign and home fields. Its work in the United States is carried on through subordinate organizations. There is also an alliance in Canada. The total receipts for the year 1901-02 aggregated \$185,162, not including some \$40,000 received from the Chinese government in settlement of the indemnity claim for losses during the Boxer insurrection of 1900. A notable advance in the number of foreign missionaries commissioned by the society was made, 70 having been sent out, of whom 32 were new missionaries. Of these workers, 18 went to China and an equal number to India, 21 to Africa, 6 to South America and the West Indies, 2 to Palestine, 1 to Japan, 2 to Anam, and 2 to the Philippines. New fields were added to the territory of the alliance by the establishment of missions in Porto Rico, Anam, and the Philippines. The Christian and Missionary Alliance maintains a missionary training institute at Nyack, N. Y., which in 1902 had a student enrollment of 188. The customary annual conventions were held. A sum exceeding \$60,000 was subscribed at the meeting in New York City in October. President, Rev. A. B. Simpson; general secretary, Rev. A. E. Funk. Headquarters, 692 Eighth Avenue, New York City.

CHRISTIAN CATHOLICS (Dowie), a sect, whose headquarters are in Chicago, composed of the followers of John Alexander Dowie, the apostle of "divine healing." Information as to the progress of the sect is declined, and there are no statistics later than those of 1900, which credited the body with 50 churches, 55 ministers, and 40,000 members. Toward the close of 1901, Mr. Dowie became the defendant in a law suit with his brother-in-law, Mr. Samuel Stevenson, over the recovery of property of which Dowie had acquired possession, the charge asserted, through "undue influence." Judge Murray F. Tuley, in the circuit court of Cook County, Ill., in January, 1902, rendered judgment in favor of Stevenson and appointed a receiver for the Zion lace industries, the concern involved, but the case was finally settled out of court. The court in handing down decision, denounced Dowie and his methods, an arraignment that has been termed the most severe indictment hitherto brought against Zion. Considerable attention was attracted to the Christian Catholic Church by the announcement of the accession of Mr. and Mrs. Booth-Clibborn and Percy Clibborn, of the Salvation Army, who had been in charge of the army work in Italy, Holland, France, and Switzerland. In the fall of 1902 an order was issued by the Cook County probate court demanding the return of \$50,000 to the heirs of the estate of a New Zealander who had become one of Dowie's adherents. This suit, together with the filing of others for small debts, gave rise to doubts of Dowie's solvency. An investigating committee, representing several of the creditors, was appointed, which, after revising carefully Dowie's estimate of his property, reported a net value over debts of more than three-quarters of a million dollars. Still Mr. Dowie thought it necessary to issue a wide-spread appeal (October 8, 1902) to Zion in all lands for small loans at 6 per cent., the temporary embarrassment of Zion's finances being due to "general financial stringency" throughout the United States.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF, an interdenominational and international order, founded at Portland, Me., in 1881, to serve as a training school

for young people in the duties of church membership. There are now over 63,000 societies with about 4,000,000 members, including over 16,000 junior societies, made up of children under fourteen years of age, and 1500 intermediate societies of boys and girls between the ages of fourteen and eighteen. Some 2000 new societies and 100,000 members were added during 1902. There are 43,822 societies in the United States. National unions have been formed in all of the principal countries of the world; and Christian Endeavor constitutions are now issued in nearly every language. London, with more than 700 societies, is the first Christian Endeavor city of the world, though Philadelphia and Chicago are close rivals. The most notable event of 1902 was the European tour of the president, Rev. Francis E. Clark, D. D., who, in eight months, represented Christian Endeavor in twenty countries and everywhere found the outlook most encouraging. National unions were organized, and arrangements made for the translation of literature and the employment of field secretaries when needed. The next international convention will be held July 9-13, 1903, in Denver, Col. The general secretary of the society, John Willis Baer, has resigned to become assistant secretary of the Presbyterian Board of Home Missions. President, Rev. Francis E. Clark, D. D.; treasurer, William Shaw; field secretary, Rev. Clarence E. Eberman. Headquarters, Tremont Temple, Boston, Mass.

CHRISTIANS, a denomination of the United States, not to be confounded with that known as Disciples of Christ, originated early in the nineteenth century. It allows latitude of theological views and asserts the importance of fellowship of all followers of Christ, claiming the name Christians "not as a sect name; but fraternally, as a name of union." The two bodies called Christian Connection and Christian Church (South), which became separated in 1854 through disagreement on the slavery question, are now in close affiliation. According to the latest statistics, the denomination has 112,395 members, 1239 ministers, and 1448 churches, with property valued at \$2,385,000. There was no change in the number of educational institutions during 1902; but Palmer University, at Muncie, Ind., is being established, toward the endowment of which Hon. F. A. Palmer promised \$100,000 on condition that the friends of the university raise an equal amount. He also contributed \$100,000 to Palmer Institute (Starkey Seminary) at Lakemont, N. Y., and, conditionally, to Palmer College, Le Grand, Ia., \$30,000; to Union Christian College, Merom, Ind., \$30,000; to Elon College, North Carolina, \$20,000. The Christians completed, with the year 1902, one of the most prosperous quadrenniums in their history. The session of the American Christian convention, which meets every four years, was held in October, at Norfolk, Va. This representative assembly, established in its present form in 1866, has charge of the general educational, missionary, and other interests of the denomination. The *Herald of Gospel Liberty*, published in Dayton, O., is the official organ of the denomination; it is owned and its editor is elected by the general body. There are also several smaller papers issued by individuals or sectional organizations.

CHRISTIAN SCIENTISTS, the members of a Christian denomination founded upon the interpretation of the Scriptures contained in *Science and Health with Key to the Scriptures*, by Mrs. Mary Baker G. Eddy. The discovery of Christian Science dates from 1866; the publication of its text-book from 1875; and the founding of the Church of Christ, Scientist, from 1879. The First Church of Christ, Scientist, in Boston, Mass., of which Mrs. Eddy is pastor emeritus, is the "Mother Church" of the denomination, all others being branch churches. In January, 1902, there were 665 branch churches and societies (the latter not yet organized as churches); in January, 1903, there were 722, showing a gain of 57 during the year. In each church and society, two "readers," generally a man and a woman, conduct the services, there being a total of 1410 throughout the body. In June, 1902, the membership of the First Church of Christ, Scientist, in Boston, was 24,278, a gain of 2784 members during the year then ended. The *Christian Science Sentinel* (weekly), the *Christian Science Journal* (monthly), and *The Christian Science Quarterly* are published under the auspices of the church. The annual communion service, held in Boston, draws thousands of Christian Scientists from many parts of the world. A message from the pastor emeritus is read at this service, devoted to an exposition of the teachings of Christian Science as applied to the special needs of the hour. At the annual business meeting of the "Mother Church" in June, 1902, it was voted unanimously to contribute any portion of \$2,000,000 that might be necessary to provide an auditorium in Boston, seating four or five thousand persons. Considerable attention was attracted to the resignation of several prominent "readers" of New York City, in conformity with a by-law adopted by the "Mother Church," which was recommended by Mrs. Eddy in the official organ of the Christian Scientists partly as follows: "The Mother Church by-law relative to a three-years' term for church readers was entitled to and has received profound

attention. Rotation in office promotes wisdom, quiets mad ambition, satisfies justice, and crowns honest endeavors." Later in the year, the advice of Mrs. Eddy that "until public thought becomes better acquainted with Christian Science, the Christian Scientists shall decline to doctor infectious or contagious diseases," attained much greater prominence, the decree being accepted by the opponents of Christian Science as an inherent contradiction, they claiming that the message essentially recognized the existence of disease and moreover admitted two classes of diseases. It was believed that the advice was prompted by the notoriety gained by the Quimby case in White Plains, N. Y., where a prominent "healer" was declared by the coroner to be guilty of manslaughter in connection with the death of a child. In Philadelphia, the application of a Christian Science Church for a charter was refused on the ground that the institution seeking incorporation was for business, not for religious purposes, and that the court had no power to grant a charter; and in a supplemental opinion, the reasons for the court's decision were set forth at greater length, the court, after reviewing Mrs. Eddy's *Science and Health*, declaring that the practice of Christian Scientists is the practice of the art of healing, and that "when persons who make a business of practicing the art of healing with or without medicine are not regularly registered physicians, they violate the law which was intended to prevent the practice of medicine by non-qualified persons." Various opinions were elicited by the decision; a prominent periodical says that "judging from newspaper comment on the subject, it would appear that the decision of the court is generally held to be unfair." Christian Science in Germany, during the early part of 1902, was a subject of discussion in the Reichstag and Emperor William issued notification that all persons connected with that faith would be excluded from the imperial court; and permission to use public halls was withdrawn by the municipal authorities of Berlin. By adherents of Christian Science, their unpopularity in Germany was attributed largely to 'the attempts that have been made to induce the Emperor to confound it with 'faith cure,' 'spiritualism,' and 'obscurantism' of various forms;' the imperial secretary of state said in the Reichstag, "I earnestly warn against using the power of the state against such things." Later in 1902 the agitation had subsided and it was reported that a new Christian Scientist Church had been opened in Berlin.

CHRISTMAS, WALTER, attained considerable notoriety in 1902, in regard to allegations of attempted bribery in the sale of the Danish West Indies (*q.v.*).

CHURCH OF CHRIST, SCIENTIST. See CHRISTIAN SCIENTISTS.

CIST, HENRY MARTYN, an American soldier and lawyer, died in Rome, Italy, December 17, 1902. He was born in Cincinnati, O., February 20, 1839, and after graduating in 1858 from Farmer's College, studied law. In April, 1861, he enlisted as a private of the Sixth Ohio infantry and served throughout the Civil War, leaving the service in 1866 with the brevet of brigadier-general of volunteers for his services at the battle of Stone River and in the campaign under General Rosecrans that terminated in the battle of Chickamauga. He resumed his legal practice in Cincinnati in 1866, and in 1869 became an officer of the Society of the Army of the Cumberland. He was an earnest advocate of the Chickamauga Park project. Besides several magazine articles on Civil War topics he edited a great portion of the *Reports of the Society of the Army of the Cumberland* (1868-85) and published *The Army of the Cumberland*, in the series "Campaigns of the Civil War" (1882); and a *Life of General George H. Thomas*.

CIVIC FEDERATION, NATIONAL. At the conference of employers and labor leaders, held December 17, 1901, under the auspices of the National Civic Federation, a permanent board to settle differences between labor and capital was appointed. Its composition was as follows:

On Behalf of the Public.—Grover Cleveland, Cornelius N. Bliss, Charles Francis Adams, Archbishop Ireland, Bishop Henry C. Potter, Charles W. Eliot, president of Harvard University; Franklin MacVeagh, James H. Eckles, John J. McCook, John G. Milburn, Charles J. Bonaparte, Oscar S. Straus, Ralph M. Easley.

Representatives of Organized Labor.—Samuel Gompers, president of American Federation of Labor; John Mitchell, president United Mine Workers; F. P. Sargent, grand master of Brotherhood of Locomotive Firemen; T. J. Schaffer, president of Amalgamated Association of Iron and Steel Workers; James Duncan, secretary of Granite Cutters' Association; Daniel J. Keefe, president of International Association of Longshoremen; Martin Fox, president of National Iron Molders' Union; James M. Lynch, president of International Typographical Union; Edward E. Clark, grand conductor Brotherhood of Railroad Conductors; Henry White, secretary of Garment Workers of America; Walter MacArthur, editor of *Coast Seaman's Journal*; James O'Connell, president International Association of Machinists.

Representatives of Employers.—Senator Marcus A. Hanna, Charles M. Schwab, president Steel Corporation; S. R. Calloway, president American Locomotive Works; Charles Moore, president National Tool Company; J. D. Rockefeller, Jr.; H. H. Vreeland, president Metropolitan Street Railway Company; Lewis Nixon, Crescent Shipyard, N. J.; James A. Chambers, president American Glass Company; William H. Pfohler, president National Association Stove Manufacturers; E. P. Ripley, president Atchison, Topeka and Santa Fe Railroad; Marcus M. Marks, president National Association Clothing Manufacturers; J. Kruttschnitt, president Southern Pacific Railroad Company.

The purpose of the board is to conciliate, to mediate, and only in rare cases, when requested by both sides, to arbitrate between capital and labor. The first dispute brought before the board was the threatened strike of the clothing cutters, involving 40,000 workmen and large capital. This strike was announced to go into effect January 1, 1902. On the board were the chief representatives of both the cutters and the manufacturers, and the difficulty was quickly adjusted by them. The next matter that claimed the attention of the board was the national cash register strike, which had then been running for nine months. It was speedily settled by the efforts of the board. Next it was asked to mediate in the union iron workers' strike in San Francisco. This strike had been on for six months and there seemed no prospects of a settlement. Owing to the good offices of the committee, the trouble was satisfactorily settled. The threatened strike of the paper workers was successfully adjusted. In the Boston freight handlers' strike the mayor of Boston and the Massachusetts Board of Arbitration invited the Civic Federation to attempt a settlement. A satisfactory settlement was reached for which the Federation deserves a large measure of credit. The trouble in the anthracite coal fields was early brought to the attention of the board, and the leading coal operators and the labor leaders were brought together in conference, but without result. The powers of the board of conciliation are purely voluntary. It has no legal status and does not assume authority for either capital or labor. Only when asked by both sides will it act as arbitrator.

A convention under the auspices of the industrial department of the National Civic Federation was held in New York City from December 8 to 10. At the first session Mr. G. C. Sykes, secretary of the Street Railway Commission of Chicago, made a strong argument in favor of compulsory arbitration in cases of corporations controlling public utilities. Mr. Sykes referred to the labor clauses inserted in the franchise grants by European and Canadian municipalities and asserted that, if the city managed its own street railway system, the employees would be treated in such a manner as to prevent strikes, and, that the railway company operating under a franchise from the city should be required to treat its employees in like manner. Mr. Charles Francis Adams followed with a scheme for the formation of a tribunal to investigate and report on great strikes as soon as they occur. The tribunal should be dissolved as soon as the strike is settled, and a new one appointed when new troubles should arise. Mr. Adams thinks this will insure an important tribunal, acceptable to both parties, because it cannot become permanently unpopular with either. At the second day's session Professor John R. Commons read an illuminating paper, showing that trade unions do limit output and restrict the use of machinery in some instances in order to keep members employed, but that this policy is usually followed only when the speeding of work is clearly unreasonable and means exhaustion, bad work, and loss of wages and the dismissal of older workmen. The discussion brought out strong protests from the labor union men against introducing piece work into shops where day work now obtains. They asserted that American laborers are rushed now and are discharged as too old at a much earlier age than is the case elsewhere. The employers tried without success to maintain that piece-work does not result in decreasing the piece rate as the product per man increases. Dr. W. S. Rainsford, a hearty friend of labor unions, showed that the unions limit the number of apprentices and thus restrict the education and opportunities of American boys. The last day of the convention was given to a discussion of the benefits of joint agreements between labor and capital regulating wages and conditions of work. Many employers testified that labor organizations kept their agreements with fidelity, and Senator Hanna agreed with Mr. John Graham Brooks that incorporation is not necessary to make unions keep their contracts, and that unions at present should not be forced to incorporate, thus exposing themselves to endless litigation. Senator Hanna and President Gompers, of the American Federation of Labor, were agreed that compulsory arbitration should never be resorted to. At that very time thousands were suffering from the dearth of coal due to the coal strike, so the assertion of the right of capital and labor to fight as long and as often as it seems good to them, did not awaken enthusiasm among the people at large. For Taxation Department of the National Civic Federation, see TAXATION.

CIVIL SERVICE REFORM. Several important orders affecting the Civil Service were made by the President during the past fiscal year. One of these dated November 19, 1901, revoked a previous order of President McKinley so as to restore to the classified service various offices in the War Department. By an order of December 24, the President directed that in making appointments officers should confine themselves more closely to the list of eligibles. At the same time he directed that persons illegally vested with office should be denied compensation pending their dismissal and that evasion of the civil service examinations should be diminished by a restriction of the system of transfers from one department to another. By an order of May 29, 1902, the President directed that all employees and officers in the classified service should be arranged in six classes on the basis of the amount of salary received. From this classification laborers and persons appointed to office with the consent of the Senate are excluded. The order directed that thereafter no laborer appointed without examination should be assigned to work of the same grade as that performed by classified employees. The purpose of the order was declared to be to break up the practice of appointing persons as "laborers" without examination and then assigning them to do clerical work. An order of July 5 directed that no recommendation for the promotion of any employee should be considered unless made by the officer under whose supervision such employee is serving. Resort to outside influence to secure a promotion is made a sufficient cause for debarring the applicant, while its repetition is punishable by dismissal from the service. By an important order of May 29, the President interpreted the meaning of the term "just cause" in the provision of a former rule, which forbids removal except for just cause, and in regard to the construction of which misunderstandings had arisen. He held that the term meant any cause other than one merely political or religious which will promote the efficiency of the service. Various amendments of lesser importance were made to the civil service rules. The report of the United States Civil Service Commission for the year ending June 30, 1902, expresses gratification at the substantial progress made in the competitive system during the year and at the excellent manner in which the civil service law and rules have been generally observed throughout the various branches of the government. Since June 30, 1901, there have been added to the competitive system, either by executive order or act of Congress, the employees of the rural free-delivery service; a considerable portion of the field services of the War Department; the additional employees made necessary by the war with Spain; and the clerks and employees of the Census Bureau, a total of 12,456 employees. During the year 62,029 persons were examined for admission to the civil service, of whom 41,039 passed and 14,999 received appointments. Compared with the previous year this shows an increase of 13,331 in the number examined, an increase of 7300 in the number that passed, and an increase of 2987 in the number appointed.

In addition to the extensions enumerated above, the civil service rules were extended to Porto Rico and the Philippines. In Porto Rico a newly organized board of examiners was established and the majority of federal positions were placed in the classified service. In the Philippines practically all official positions are now included within the classified service with the exception of teachers, and it is understood that these will be made subject to classification at an early date. The commission made an earnest recommendation to Congress that a law be enacted furnishing facilities for determining the comparative qualifications of applicants for the consular service by means of open, competitive, non-partisan examinations. It also suggests that Congress provide that the further admission to the classified service be based upon the condition that appointees shall provide against their own superannuation or other disability by adequate annuity insurance, the premiums to be deducted from their salaries. To this end the commission recommends the appointment of a committee of experts to aid the President in preparing rules for the purpose. The twenty-second annual meeting of the National Civil Service Reform League was held at Philadelphia, December 11 and 12. In spite of inclement weather the meeting was one of the best ever held. The absence of Col. John W. Ela, whose death occurred recently, was regretted. He had been one of the leading members of the league and an able advocate of civil service reform. The council of which Mr. C. J. Bonaparte was chairman made a report to the league on the condition and progress of the civil service reform movement for the year, paying a high tribute to President Roosevelt for the practical enforcement of the civil service law and for the general elevation of the moral tone of the public service. The reorganization of the Civil Service Commission, the extension of the rules to the rural free-delivery service, and the partial introduction of the merit system into the civil service of the District of Columbia, were acts of the President which received the heartiest approval of the council. The council reported that it had labored assiduously to prevent legislation hostile to civil service reform and to enlighten and guide public opinion by the distribution of appropriate literature. Addresses before the meet-

ing of the league were made by President D. C. Gilman, Prof L. S. Rowe, Hon. Harry A. Garfield, Hon. Carl Schurz, Elliot H Goodwin, and others. The league passed several resolutions urging the extension of the merit system to the rest of the municipal service of the District of Columbia; to the consular service and Indian agencies, and to those cities of the country not now under civil service rules. It also expressed regret at the defects in the administration of the civil service system in New York City, and urged all Civil and Spanish War veterans to oppose the "veteran preference" bills. An interesting feature of the annual meeting was the report of the work being done in the insular territories of the United States toward the establishment of the merit system.

The officers elected for the ensuing year are as follows:

President, Daniel C. Gilman, Baltimore; vice-presidents, Charles Francis Adams, Boston; Joseph H. Choate, New York; Grover Cleveland, Princeton; Charles W. Eliot, Cambridge; Harry A. Garfield, Cleveland; Arthur T. Hadley, New Haven; Henry Charles Lea, Philadelphia; Seth Low, New York; Franklin MacVeagh, Chicago; George A. Pope, Baltimore; Henry C. Potter, D.D., New York; P. J. Ryan, D.D., Philadelphia.

The movement in the direction of civil service reform during the year was quite general and encouraging. In Congress an increasing interest was shown by the appropriation of the amount asked for by the Civil Service Commission without a dissenting vote and by the favorable report from the Senate Committee on Foreign Relations in favor of a salaried classification of the consular service and the assignment of positions by the President in accordance with the compensation. Among the States notable progress was made in California and Illinois. In the former State a proposition to amend the constitution so as to provide a civil service system was adopted by the assembly, and in the latter a commission was appointed by the governor to prepare a civil service law for the State. Movements were set on foot to introduce the merit system in several municipalities, notably Los Angeles and Detroit. A further evidence of increased popular interest was shown in the activity of the women's auxiliary clubs in behalf of the advancement of reform.

CLARK, EDWARD, architect of the capitol at Washington, died January, 6, 1902, at Washington. He was born in Philadelphia in 1824, and received a common school education, afterward studying architecture under Thomas U. Walter, the architect of the extension of the national capitol, whom he succeeded in 1865. He was engaged on many commissions for government work, among which were the construction of the Congressional Library and the completion of the Washington Monument. He was a fellow of the Clarendon Historical Society of Edinburgh, and a member of the American Institute of Architects.

CLARK UNIVERSITY, Worcester, Mass., opened in 1889. President, G. Stanley Hall, Ph.D. In 1902 the teaching force numbered 13 and the students 50. There were about 23,000 volumes in the library. The university has aimed to supplement the work of other institutions, particularly by way of highly specialized research in biology, psychology, physics, and pedagogy. The scholarship both of faculty and of students ranks very high, but in numbers the student body has always been exceedingly small. A change was begun in the strictly university character of the institution in 1902, when it was decided to establish a collegiate department. The public inauguration of this work took place in October of that year, when Hon. Carroll D. Wright was formally installed as head of the new department. It was stated that his active duties would not begin until after his retirement from his position as United States commissioner of labor. See **PSYCHOLOGY**, EXPERIMENTAL (paragraph Clark University).

CLARKE, Sir ANDREW, agent-general for Victoria, Australia, died March 29, 1902. He was born July 27, 1824, in Hampshire, England, and was educated at King's School, Canterbury, and at Woolwich. In 1844 he entered the Royal Engineers and served in the New Zealand campaign of 1867-68, for which he received a medal. In 1851 he was a member of the legislative council of Tasmania, and two years later was appointed surveyor-general of Victoria. He became a member of the Australian Parliament and minister of lands, and later went on a special mission to the west coast of Africa. As director of works of the navy from 1864 to 1873, he designed and constructed important extensions in some of the largest naval arsenals of the British Empire. From that time he held many public offices, including the governorship of the Straits Settlements, minister of public works in India, and was inspector-general of fortifications. His decorations were C.B., G.C.M.G., and C.I.E. He was the author of several works on engineering.

CLARKE, Sir CAMPBELL, an English journalist, died August 26, 1902, at Oldlands, England. He was born October 3, 1835, was educated at the University of Bonn and was a librarian in the British Museum from 1852 to 1870. After traveling in Turkey and Greece as a special newspaper correspondent (1870-72), he

became Paris correspondent of the London *Daily Telegraph*. He was knighted in 1897. He was made an officer of the Legion of Honor and received a number of other honorary decorations. In addition to his journalistic writing, he adapted a number of plays into English and wrote several songs.

CLAY. See MINERAL PRODUCTION.

COAL. During the year 1901 the position of the United States as the chief coal producing nation of the world was firmly established. The output of bituminous coal was 225,826,849 short tons and of anthracite 67,471,667 short tons, making a total of 293,298,516 tons, an increase of 23,615,689 tons, or 8.8 per cent. for the year. This total represented about one-third of the world's product in 1901, and exceeded the output of Great Britain, the nearest competitor, by 47,965,938 tons. Since 1880 the coal mining industry of the United States has made unprecedented progress; the output of anthracite coal increased about 240 per cent. during this period, while the bituminous industry increased more than 500 per cent. The production in 1901 was distributed over 28 States and Territories, of which those within the Appalachian region contributed 210,743,774 tons, or about three-fourths of the total for the entire country. Nearly all of the States reported an increase, and in many the yield was the largest ever recorded.

* Decrease.

The production of the United States in 1902 showed little change from the total of the preceding year. The strike on the part of the Pennsylvania anthracite miners, which lasted from the middle of May until late in October, curtailed the output in this region about 20,000,000 tons, but this shortage was made up by the increased yield in the bituminous fields of Pennsylvania and other States. It is estimated by *The Engineering and Mining Journal* that the total production of the United States was about 293,000,000 short tons, of which total 45,000,000 tons were anthracite and 248,000,000 tons bituminous coal. In spite of the labor troubles, Pennsylvania continued to lead the States in the amount and value of its output, contributing about 140,000,000 tons in all, or 10,000,000 tons less than in 1901. In western Pennsylvania, which supplies much of the coal for metallurgical purposes, operations were conducted on a very large scale; the increased yield of these mines for 1902 ranged from 10 to 30 per cent. The shipments of both anthracite and bituminous coal from Pennsylvania mines are controlled by the principal coal-carrying railroads under a "community of interest" plan, by which scheduled prices have been established in the large markets, freight rates increased, and the territory divided among the railroads in such a way as to avoid competition. Illinois continued to hold

second place among the States, its output being considerably larger than that for 1901. Operations in this field, as well as in Ohio, which ranked third in production, were unhampered by labor troubles, and the coal found a ready market owing to the short supplies from Pennsylvania and West Virginia. A reduced output was reported in the latter State as many of the mines in the Flat Top, Fairmount, Kanawha, and Pocahontas fields were closed during a part of the year by labor troubles. Among the other important coal mining States, increases were recorded in Alabama, Indiana, Colorado, Iowa, Kansas, Arkansas, and Indian Territory. The coal industry in Texas and California suffered from competition with fuel oil. The imports of anthracite to the United States in 1902 were 73,006 tons and of bituminous coal 2,478,375 tons; the exports of anthracite were 907,977 tons and of bituminous 5,218,969 tons.

Throughout the latter half of 1902 there was a shortage of coal in the eastern markets which draw their supplies from the Appalachian fields. The anthracite mines of Pennsylvania were closed down from the middle of May until late in October, and before the first of July the coal stocks in the large markets were depleted. This threw an increased burden on the bituminous mines and soft coal railroads to which they were not equal. The local ordinances in regard to smoke prevention were suspended temporarily in many of the cities and the enlarged use of bituminous coal raised the prices along the Atlantic seaboard to \$5.00 per ton before the first of July. The conditions were made more acute by the car shortage on the eastern railways, and by speculative concerns which bought up the available supply. In September bituminous coal brought as high as \$8.50 per ton in New York and New England, and in the following months even higher prices were obtained. Some coal was imported from Canada and England, but it did not materially affect the situation. In the anthracite trade the famine was the most acute ever experienced in this country. The supplies of the large cities were practically exhausted before the strike had continued two months, while the prices rose steadily, reaching a maximum of \$20 per ton. With the resumption of operations in the anthracite mines, there was an immediate improvement in the situation, although the supply throughout the year remained insufficient to meet the full requirements. See STRIKES (paragraph Anthracite Coal Strike).

Foreign Countries.—There was no material increase in the output of Great Britain in 1902. Some of the mines in South Wales restricted their output in order to maintain prices, while in other localities a larger yield was reported than in 1901. The question of coal supply, in view of the high prices and the limited character of the British deposits, continued to receive widespread attention. Experiments were conducted by the Institute of Marine Engineers with a view to discovering some substitute material suitable both for heating and metallurgical purposes; a prepared form of peat gave satisfactory trial results, but its high cost would not admit of its utilization at the present time. A decrease in output was recorded in France, owing principally to labor troubles, and in Austria which suffered from an industrial depression. In Germany the coal mining syndicates curtailed operations to avoid a reduction of prices. Russia and Belgium made little advance over 1901. The mines in eastern Canada were especially active, the output in Nova Scotia being the largest on record. New developments were reported in the State of Coahuila, Mexico, and in the province of An-hui, eastern China.

COCHIN-CHINA, a name formerly applied to a greater part of the Indo-Chinese peninsula but now generally restricted to the southernmost division of the French colony of Indo-China. The area is about 22,000 square miles, and the population 2,323,499, of whom about 4500 are Europeans. Saigon, the capital, has a population of 50,000. A lieutenant-governor and other French officials directly administer the affairs of the country, which is subdivided into 21 provinces and 2 municipalities, and is represented in the French Parliament by one deputy. In addition to the troops maintained in the colony by France, there is a local military force of 2400. There is a well organized school system with over 18,000 pupils enrolled. Revenue and expenditure balanced in the budget of 1901 at 4,439,500 piastres, the contribution of the French budget in the same year amounting to 320,112 francs. (The franc is worth 19.3 cents and the piastre about 2.4 francs.) The chief product is rice, exported in 1900 to the value of 89,225,000 francs. Fish, cotton, silk, pepper, spices, and hides are also exported. Coffee culture is advancing. The total value of exports (with Anam and Cambodia) in 1900 amounted to 107,350,000 francs, and imports, chiefly metals, tissues, and agricultural implements, 121,670,000 francs. There is a railroad from Saigon to Mytho (51 miles), a line connecting Saigon with Tan-linh (82 miles) is under construction and other lines are projected. See **INDO-CHINA, FRENCH**.

CÆLIOSCOPY. This is a new method for examining the peritoneal cavity devised by a German surgeon named Kelling. It consists essentially in filling the peritoneal cavity with sterile air through a hollow needle, then plunging a trochar

through the abdominal wall and passing through the trochar a cystoscope. By this means the adjacent peritoneal surface may be inspected. The method is designed to take the place of exploratory incisions into the abdomen. It has as yet been tried only on animals.

COFFEE. According to *L'Economiste Français* the estimated world's crop of coffee in 1902 was 16,500,000 bags (of 132.28 pounds), as compared with 15,460,000 bags in 1901. The crop of Brazil, the chief coffee producing country, in 1902 was 11,000,000 bags, as compared with 11,500,000 the previous year. The supply continues to run ahead of the consumption. This was conceded to be the principal cause of the low price in the declarations adopted by the International American Coffee Commission, which met in New York City during the month of October, 1902. This commission recommended that efforts be made to improve the varieties and methods of cultivation through public agencies, especially agricultural and botanical stations; "that prizes be offered in order to stimulate cultivations other than coffee; that effective propaganda be established to extend the use of coffee in new markets; that governments aid this by requiring the use of coffee in armies and navies, establishing centres for the demonstration of pure coffee and prohibiting, or heavily taxing, the sale of adulterated coffee and all substitutes bearing the name of coffee." The government of Brazil was invited to convoke as soon as possible a second international conference of experts on coffee "for the purpose of concluding the conventions or treaties of international character, which may be derived from the measures recommended by this conference." Imports of coffee into the United States during the calendar year 1902 amounted to 955,283,919 pounds, valued at \$64,157,664, as compared with 1,072,009,182 pounds, valued at \$70,156,044 in 1901. In 1902 imports from Brazil amounted to 764,658,963 pounds, valued at \$47,004,453; other South America, 63,824,056 pounds, \$4,616,897; Central America, 45,512,114 pounds, \$4,788,443; Mexico, 30,719,800 pounds, \$2,785,633; East Indies, 20,814,403 pounds, \$2,385,100; West Indies, 20,429,314 pounds, \$1,440,474.

Grafting coffee trees is receiving attention in connection with improving coffee plantations. This method of propagation is of primary importance in districts where nematodes are abundant. These severely affect Arabian coffee varieties, but Liberian tree roots are seldom attacked. The Liberian trees are therefore used as stock for Arabian and other better sorts of coffee. Another advantage is the increased yields obtained from the Liberian trees when grafted with the Arabian, Maragogipe, or other improved varieties, while the quality of the Arabian coffee does not seem to be in any manner seriously affected by growing on Liberian stock. A hybrid between Liberian and Arabian coffee is reported as having been obtained on the island of Réunion. The hybrid is said to resemble the Arabian tree most in the form of its leaves, flowers, fruits, and the quality of the berries, while on the other hand it is considered more resistant to insect attacks and fungus diseases than the Arabian coffee and in these respects resembles the Liberian tree. In fertilizer experiments carried on in Brazil, it was found that nitrogen was of value in coffee culture only when applied in quantities proportional to the phosphoric acid and potash in the soil. A complete fertilizer produced larger berries and grains than potash manures. Nitrogenous manures, on the contrary, diminished the size of the berries and grains. Shade in coffee culture is no longer regarded by all specialists as a general necessity. It is argued that the beneficial effects connected with shade result from the protection afforded the coffee tree and from the increase of soil fertility due to the leguminous species of trees used for shade rather than from the actual shading itself. The newly established Porto Rico experiment station has undertaken systematic investigations with reference to improvement of varieties and of methods of culture.

COINS, VALUE OF FOREIGN. The following tables show the valuation by the United States Treasury of coins of foreign countries having (A) fixed currencies, or (B) fluctuating currencies:

A.—Countries With Fixed Currencies.

Valuations do not include "rates of exchange."

COUNTRIES.	Standard.	Monetary Unit.	Value in U. S. Gold.	Coins.
Argentine Republic.	Gold and silver..	Peso.....	\$0.96,5	Gold—argentine (\$4.82,4) and $\frac{1}{2}$ argentine; silver—peso and divisions.
Austria-Hungary*...	Gold	Crown20,3	Gold—20 crowns (\$4.05,2) and 10 crowns.
Belgium	Gold and silver .	Franc19,3	Gold—10 and 20 franc pieces; silver—5 francs.
Brazil	Gold	Milreis54,6	Gold—5, 10, and 20 milreis; silver— $\frac{1}{2}$, 1, and 2 milreis.

COUNTRIES.	Standard.	Monetary Unit.	Value in U.S. Gold.	Coins.
British North America (except Newfoundland)	Gold	Dollar	\$1.00	
British Honduras	do	do	1.00	
Chile	do	Peso36,5	Gold—escudo (\$1.25), doubloon (\$3.65 and condor (\$7.30); silver peso and divisions.
Costa Rica	do	Colon46,5	Gold—2, 5, 10, and 20 colons; silver—5, 10, 25, and 50 centimos.
Cuba	Gold and silver	Peso92,6	Gold—doubloon (\$5.01,7); silver—peso (60 cents).
Denmark	Gold	Crown26,8	Gold—10 and 20 crowns.
Ecuador†	do	Sucre48,7	Gold—10 sucres (\$4.8665); silver—sucre and divisions.
Egypt	do	Pound (100 piastres).	4.94,3	Gold—10, 20, 50, and 100 piastres; silver—1, 2, 10, and 20 piastres.
Finland	do	Mark19,3	Gold—10 and 20 marks (\$1.93 and \$3.85,9).
France	Gold and silver	Franc19,3	Gold—5, 10, 20, 50, and 100 francs; silver—5 francs.
Germany	Gold	Mark23,8	Gold—5, 10, and 20 marks.
Great Britain	do	Pound sterling	4.86,6‡	Gold—sovereign (pound sterling) and half sovereign.
Greece	Gold and silver	Drachma19,3	Gold—5, 10, 20, 50, and 100 drachmas; silver—5 drachmas.
Haiti	do	Gourde96,5	Silver—gourde.
India	Gold	Rupee32,4	Gold—sovereign (\$4.8665); silver—rupee and divisions.
Italy	Gold and silver	Lire19,3	Gold—5, 10, 20, 50, and 100 lire; silver—5 lire.
Japan†	Gold	Yen49,8	Gold—1, 2, 5, 10, and 20 yen.
Liberia	do	Dollar	1.00	
Netherlands	Gold and silver	Florin40,2	Gold—10 florins; silver— $\frac{1}{2}$, 1, and 2 $\frac{1}{2}$ florins.
Newfoundland	Gold	Dollar	1.01,4	Gold—\$2 (\$2.02,7).
Peru 	do	Sol48,7	Gold—libra (\$4.8665); silver—sol and divisions.
Portugal	do	Milreis	1.08	Gold—1, 2, 5, and 10 milreis.
Russia	do	Ruble51,5	Gold—imperial (\$7.718) and $\frac{1}{2}$ imperial (\$3.80); silver— $\frac{1}{2}$, $\frac{1}{4}$, and 1 ruble.
Spain	Gold and silver	Peseta19,3	Gold—25 pesetas; silver—5 pesetas.
Sweden and Norway	Gold	Crown26,8	Gold—10 and 20 crowns.
Switzerland	Gold and silver	Franc19,3	Gold—5, 10, 20, 50, and 100 francs; silver—5 francs.
Turkey	Gold	Piastre04,4	Gold—25, 50, 100, 200, and 500 piastres.
Uruguay	do	Peso	1.03,4	Gold—peso; silver—peso and divisions.
Venezuela	Gold and silver	Bolivar19,3	Gold—5, 10, 20, 50, and 100 bolivars; silver—5 bolivars.

*The gold standard went into effect January 1, 1900. Values are still sometimes expressed in the florin, which is worth 2 crowns.

†Gold standard adopted October 1, 1897.

‡Gold standard adopted in November, 1900.

||Gold standard adopted October 13, 1900.

COKE. The production of coke in the United States in 1901 was 21,795,883 short tons, valued at \$44,445,923, against 20,533,348 short tons valued at \$47,443,331 in 1900, showing an increase in production of 6.15 per cent., and a decrease in value of 6.3 per cent. for the year. The extraordinary demand for coke in the iron and steel industries, which characterized the trade in 1900, continued throughout 1901, but prices revealed a tendency to return to a more normal level. Standard grades of furnace coke were quoted at from \$1.75 to \$2.25 per ton, the higher prices being reached in the latter part of the year. There were 64,001 ovens in existence at the close of 1901, and 5155 in course of erection. The introduction of by-product ovens into the United States has been successful from a commercial standpoint, and a large increase in the number of plants using this type of oven may be expected in the near future. The by-products including tar, ammonia, and gas, are more valuable than the coke; the value of the tar and ammonia recovered in the manufacture of 1,179,000 tons of coke in 1901 was \$1,029,876, while the gas was worth about \$3,000,000. Coal-tar is the basis of a series of very valuable chemical compounds including various organic acids, colors, and dyes that are now imported, principally from Germany.

COLLEGES. See **UNIVERSITIES AND COLLEGES**; see this article also for College Athletics and Gifts to Colleges.

COLLIS, CHARLES H. T., a major-general in the Union army during the Civil War, died May 11, 1902. He was born February 4, 1838, in Cork, Ireland, and received an academic education in England. Having entered the Union service in 1861, he participated in almost every battle in which the Army of the Potomac was engaged during the war, and rose from private to the rank of major-general of volunteers. After the war he acted twice as city solicitor of Philadelphia, was director of city trusts for fifteen years, and was commissioner of public works during the Strong administration in New York City, where he was engaged in the practice of law from that time until his death. He was very active in local Republican politics.

COLOMBIA, a republic in the northwestern part of South America between the Caribbean Sea and the Pacific Ocean. The capital is Bogotá.

Area and Population.—The nine States, or departments, of Colombia have an aggregate area estimated variously at from 455,000 to 513,000 square miles, the boundaries being in dispute on almost every side. Of the population, estimated (1895) at 4,000,000, about one-half are whites and half-castes.

Government and Finance.—The executive power is vested in a president elected for a term of six years, and assisted and advised by a ministry of six members responsible to the congress. This body, in which the legislative power rests, consists of a Senate, composed of senators elected three from each of the States, and a House of Representatives, chosen for four years by universal suffrage. The chief executive in 1902 was José Manuel Marroquin (Conservative), who was elected vice-president in 1898, but succeeded President San Clemente (*q.v.*) as acting president by the *coup d'état* of July 31, 1900. The size of the national army is determined annually by the congress, but in time of war the president may increase its strength to such proportions as may be required.

The monetary standard is silver, and the peso is the unit of value. The peso was worth 38.4 cents on October 1, 1902, but the paper peso, which is in general circulation, is greatly debased. Owing to the rebellion, the extravagance and irregularity of the present executive's management, the financial condition of the country is wretched, and there are few signs of improvement. In the biennial period 1899-1900 the revenue and expenditure balanced in the official estimates at 29,918,640 pesos (paper). In the biennial period 1901-02 the estimated revenue had decreased to 28,983,640 pesos, and the estimated expenditure, due largely to the continued war, had increased to 40,427,575 pesos. The revenue is derived largely from import and export duties, both of which are excessive, and from numerous monopolies. There is practically no coin in general circulation, except in Panama, where conditions are more favorable for trade. Gold is at a premium of 2500 per cent. and the government printing presses continue to turn out paper currency, which has been enormously increased since August, 1901, when official figures showed 350,000,000 pesos to be in circulation. The internal debt amounting in 1899 to 11,359,074 pesos and the foreign debt of £3,514,442 (1896) have both greatly increased during the civil war.

Industries and Commerce.—Mining and agriculture although the principal industries of the country are in a very backward and unsatisfactory condition. The total output of gold and silver, the mining of which has been most developed, averages about \$4,000,000 (in United States money). Mines of copper, lead, platinum, mercury, cinnabar, manganese, coal, iron, salt, and emeralds are worked to some extent. Although much of the soil is fertile, only a small part of it is under

cultivation and lack of transportation facilities in the interior renders its development difficult. Nevertheless coffee cultivation is being extended, and rubber, cacao, tobacco, sugar, vegetable-ivory, dyewoods, and various sorts of grain are produced. No recent trade statistics for the country at large exist, owing to the disorganized conditions, which, with the high export duties, have caused foreign commerce to fall off considerably. The value of the foreign commerce for 1898 in gold pesos amounted to: imports, 11,083,028; exports, 19,157,788. The transit trade across the Isthmus of Panama is of considerable importance, aggregating, in 1900, 357,377 tons. The trade of Colombia is largely with the United States, Great Britain, France, and Germany in the order named.

Communications.—The total length of the railways in operation in Colombia in 1901 was 402 miles. In addition 76 miles were under construction, and 330 miles projected, which it is scarcely probable will be undertaken at present. On the Magdalena River, which is navigable 900 miles from its mouth, and on its tributaries 215 miles of which are navigable, 42 steamers ply, and extensive improvements in dredging and canalizing have been undertaken.

HISTORY.

The Liberal Insurrection.—The insurrection of the Liberals against the Conservative government in Colombia, which broke out in the fall of 1899, showed signs, under the energetic leadership of Uribe-Uribe and Herrera, of taking on new life at the beginning of the year 1902. Throughout 1901, it will be remembered, the action of President Castro, of Venezuela, in continually supplying arms, men, and ammunition to the Liberals, brought the two countries to the verge of war. It was indeed asserted by Castro, in vindication of his action, which he made no attempt to deny, that troops raised and equipped by the Colombian government had several times crossed the Venezuelan line and engaged the forces he had set to watch the border. There is little doubt, despite the confusion and uncertainty, that the two governments were taking measures against each other that practically constituted a state of war. But there is also continued hostility between the Liberal and Conservative elements in Venezuela and Ecuador, so that a war between Conservative Colombia and either of the two Liberal states mentioned would have more the character of a war of parties than of nations.

Liberal Victories.—The year 1902 opened with the report that the insurgent general, Herrera, was planning the capture of Panama. The first conflict was a severe naval engagement between the rebel and government forces, which took place in the harbor of Panama on January 19 and 20. The result was a victory for the rebel fleet of three vessels, which sunk the government ship *Lautaro*. General Alban, the able governor of Panama, was killed and was succeeded by General Amaya. While Herrera was thus successful on the isthmus, Uribe-Uribe, who had been working his way across the Santander district toward the capital, Bogotá, was defeated and compelled to stop his advance.

New Conservative Cabinet.—Little of importance from a military point of view occurred during February, 1902, the government forces on the isthmus were greatly reinforced, and Herrera attempted no advance. On February 11 the Colombian cabinet was reconstituted as follows: Home affairs, Perez; war, Fernandez; hacienda (finance), Lagos; treasury, Uribe; public instruction, Casus; posts and telegraphs, Revas.

Death of San Clemente.—The principal event of interest in March was the death, on the 19th, of Dr. Manuel A. San Clemente, who was elected president of the republic in 1898 and was forced into retirement in 1900 by Vice-President Marroquin, who has been conducting the government, as acting president, on autocratic lines ever since. San Clemente, although a Conservative, had like other influential men of his party been driven to sympathize more or less openly with the Liberal movement by Marroquin's almost dictatorial policy. His death legitimized Marroquin's government. During March and April, 1902, the position of the forces remained about the same, victories seemed to be about evenly divided between the government and insurgents, and Uribe-Uribe was reported to be still "moving on" Bogotá and to have reached a point within fifty miles of that city. Toward the end of April the government sent reinforcements into Panama, to meet an expected advance of the insurgents who had gathered in force at Bocas del Toro, west of Colon. The hostile forces continued to face one another throughout May, the few engagements reported being generally in favor of the Liberals.

Waning of the Revolt.—At the beginning of June the towns of Panama and Colon were reported as being the only places on the isthmus in government control, but on the 22d of the month, after a sharp conflict the government troops occupied Agua Dulce. Reports from the interior seemed to indicate that the strength of the revolution was waning, and toward the end of July it was rumored that Herrera, the Liberal leader, was willing to negotiate terms of peace. The comparative quiet

that prevailed through August proved to be only the calm before the storm, as early in September the revolt broke out with renewed activity. Early in the month Herrera recaptured Agua Dulce from the government, and was reported to be preparing to move on Colon and Panama.

Intervention of the United States.—The renewal of hostilities on the isthmus brought with it the threat of an interruption of traffic on the Panama Railway, which the United States is bound by treaty to protect and keep open. In order to fulfil treaty obligations and preserve the neutrality and inviolability of the railroad property, the United States government dispatched the battleship *Wisconsin*, to reinforce the *Ranger* already at Panama, and the cruiser *Cincinnati* was ordered at the same time to Colon. On September 17 Commander McLean of the *Cincinnati* placed United States marines on all trains leaving Colon for Panama and issued a set of regulations regarding transportation over the railroad, which were printed in Spanish and posted along the line. This act brought forth a storm of protest from papers both in Colombia and in other South American countries, who declared it to be an invasion of the sovereign rights of Colombia over its own territory. The Liberal reawakening, however, proved to be of but short duration, and on September 22 Herrera after making an advance on Panama retired to Agua Dulce. Some days before, September 15, the Liberal power in the interior was reported to have been still further weakened by the surrender of the rebel forces under General Carreazo. The month of October saw a still further decline in the Liberal hopes. Surrenders of insurgents were reported with increasing frequency during the month.

Surrender of Uribe-Uribe.—On October 14, 1902, Uribe-Uribe and Castillo with the largest Liberal force in the field outside of Panama, were decisively defeated at La Cienaga by General Majarres and a strong government force, who followed them to Rio Frio, near Santa Marta, east of Barranquilla, where on October 28 they surrendered. The capitulation included 10 cannon, 2500 rifles, and 300,000 rounds of ammunition. By its terms Uribe-Uribe undertook to lend his influence toward bringing the insurrection to a close. The backbone of the revolt was broken and from this point hostilities were confined practically to Panama.

Peace.—The United States battleship *Wisconsin* arrived at Panama on October 5, 1902, and Admiral Casey at once undertook the rôle of peacemaker. He placed the *Wisconsin* at the disposal of the hostile leaders for the carrying on of negotiations, and at length, on November 21 on the deck of the battleship a treaty of peace was signed by representatives of the government and of General Herrera. The terms of peace included the immediate re-establishment of civil government, the liberation of prisoners of war, full amnesty to all participants in the revolt, and the promise on the part of the government to hold an election for a special congress to which would be submitted the following questions: the construction of the isthmian canal, the reforms proposed by President Marroquin in 1898, the reform of the monetary system, and the proposal to make the canal rentals inalienable. The insurgents agreed to give up their arms and munitions of war and the steamship *Almirante Padilla*. The government agreed to furnish transportation to disbanded rebels and to care for the sick and wounded.

COLONIES. Colonies and other dependencies are treated under their own titles. See also **GERMANY** (paragraph Colonies); and **GREAT BRITAIN** (paragraph Colonial Conference).

COLORADO, a western State of the United States, has a land area of 103,645 square miles. The capital is Denver. Colorado was organized as a Territory February 28, 1861, and admitted to statehood August 1, 1876. The population in 1900 was 539,700, while in June, 1902, as estimated by the government actuary, it was 566,000. The populations of the two largest cities in 1900 were: Denver, 133,-859; Pueblo, 28,157.

Finance.—The cash in the State treasury at the close of the biennial term ending November 30, 1900, was \$1,881,716.20. The total receipts during the two-year period from December 1, 1900, to December 1, 1902, were \$4,038,571.65, and the disbursements \$3,833,294.27, leaving a balance on December 1, 1902, of \$2,086,994.58. For some years previous to 1901 the tax laws of Colorado had been insufficient to meet the expenses and a large floating deficiency had accumulated. In 1901 however, Colorado passed a new tax providing, among other things, for corporation and liquor license taxes and for a collateral inheritance tax. Owing to this enactment it was estimated that there would be a surplus for the two years of approximately \$200,000, which might be used in the further reduction of the floating debt, which had been decreased during the biennial term by some \$300,000. The gross floating debt on November 30, 1902, was \$2,968,762.68; the gross floating and bonded debt combined was \$3,973,482.68. Against this amount, however, there were collectable assets due the State, estimated at \$1,531,311.87, thus reducing the net debt to \$2,442,170.81. The total assessed value of property in the State amounted to \$465,874,288 in 1901 and \$354,002,501 in 1902. Of the valuation in 1902, agricultural

land was assessed at \$26,696,729; grazing land at \$15,077,532; land improvements at \$14,454,238; town and city lots at \$79,782,312, and cattle at \$16,778,474. Railroads, which in 1901 were assessed at \$121,770,775 were in 1902 assessed at only \$55,850,048, thus accounting in large part for the total reduction in assessments in 1902. Larger returns were derived from the corporation license tax of 1901 than were expected, and although \$105,350 were derived from the new liquor license fees, the State treasurer stated that there were over 1500 persons selling liquor in the State who had not complied with the law.

Agriculture.—Since the employment of irrigation on an extensive scale agriculture has advanced in Colorado until now the farm products are almost of equal importance with the products of the mines. (For statistics of production see articles on the leading cereal crops.) In the production of sugar beets Colorado ranks third among the States. The production of sugar in 1902 amounted to 29,643 tons. The first agricultural census of Colorado in 1870 showed 1738 farms. The census of 1900 showed 24,700 farms of 9,474,588 acres, valued at \$106,344,035. The quantity of land actually under cultivation and in crops was given as 2,273,968 acres. The total value of farm property was placed at \$161,045,111. As a sheep raising State Colorado ranks eleventh in the Union. The industry is one of great importance and is the chief source of wealth in several counties. The number of sheep in 1901 was 2,498,200 and the total clip 16,238,300 pounds, or 6.5 pounds a fleece. In 1902 sheep were stated to number 1,917,300, yielding 12,590,720 pounds of wool, or 6.4 pounds a fleece. This falling off was due to the drought and the heavy demand for mutton, which induced stockmen to sell every available animal. There were 76 creameries and 27 cheese factories in the State in 1901 and the total value of the dairy products of the entire State was given at \$5,581,134.80. The dairy interests have increased steadily in importance during the past five years. A large condensed milk factory was constructed at Fort Lipton in 1901.

Mining.—The mining industry continues to be the leading one in the State. In 1901 the total value of the products of the metalliferous mines, gold, silver, lead, and copper, was \$46,303,239.71, a falling off compared with the preceding year of more than \$4,000,000. The production of each of the four metals was less than in the preceding year, except for copper, which showed an increase of \$10,285.18. No official statistics for the year 1902 were available, but from unofficial sources it seems that there was a slight increase, as compared with 1901, except in the production of gold. More economic methods of production caused large deposits of low grade ore to be worked so that the tonnage of ore handled was greater in 1902 than ever before. The increased output of silver, however, was more than offset by the decrease in price. Mining and smelting employed a far greater number of men than any other industry in the State. Wages in the mines vary from \$2.50 to \$4.00 per day. A little more than one-third of the entire mineral output of the State was mined in Teller County. In 1901, 37,260 men were employed in the mining and smelting industries, while in 1902 there were 35,118. Coal mining increased greatly in importance during 1902. During 1901 there were 98 coal mines operating in the State employing about 8000 miners and producing 5,978,410 tons, of which 64,580 tons were anthracite, 4,429,419 tons bituminous, and 699,528 tons lignite. In 1902 the total production was 7,522,923 tons, an increase of 25 per cent.; 790,617 tons of coke were produced, an increase of 42 per cent. over 1901. The year 1902 witnessed extensive prospecting for oil throughout the western part of the State. No flow of any account was obtained, however, except in Boulder County, where small wells yielded perhaps 10,000 barrels during the year. The Florence oil-field continues to be the only one of importance, but the company in possession has made no attempt to increase the output, because, it is asserted, of a desire to refrain from encroaching on Standard Oil territory. The total production for 1902 was about the average (500,000 barrels), with an approximate value at the wells of \$600,000. There was considerable activity in the transfer of mining properties during the year. Eastern capitalists have invested extensively in the Leadville district. An English syndicate purchased the Camp Bird mine for \$3,500,000. The American Smelting and Refining Company obtained almost complete control of the silver, lead, and zinc smelting business in the State and erected new smelters at Pueblo and at Murray, Utah, with the result that the Philadelphia smelter at Pueblo, an independent concern, was obliged to shut down. The organization of labor unions in different parts of the State was accompanied with considerable disturbance of industry. A protracted dispute at Telluride resulted in considerable violence and some bloodshed. Non-union men, imported to take the places of the strikers, were fired on and compelled to surrender, and were then escorted to the county line by the union men.

In 1902 the Colorado Fuel and Iron Company began an interesting experiment along the line of social betterment. The company, which employs between 16,000 and 17,000 men in its mines, smelters, steel works, etc., scattered throughout Colorado,

Wyoming, and New Mexico, established a "sociological department," for the betterment of the men in its employ and their families. The plan includes the organization and establishment of kindergartens, cooking schools, sewing schools, reading rooms, gymnasiums, night schools, boys' clubs, girls' clubs, traveling libraries, traveling art collections, and popular lectures. Arrangements were made during the year for the erection of a home for disabled workmen. At Redstone, where one of the principal plants is located, cottages were built for the workmen, and the erection of a clubhouse was begun. A weekly paper, *Camp and Plant*, was started in order to give the news of the various settlements. John C. Osgood, chairman of the board of directors of the company, denied that the plan was merely a philanthropic movement. He declared that it was one way of carrying out "common sense business ideas in the conduct of the business." Capt. J. D. Lifter, head of the Volunteers of America in Pueblo, was placed in charge of the entire scheme.

Political Platforms—The Republican party of Colorado in its platform endorsed the administration and called for the renomination of President Roosevelt in 1904. The plank regarding trusts and corporations declared that "the Republican party of Colorado recognizes in the growth of centralized corporate power evolution in business conditions which is the result of economic laws, but we recognize also that out of such consolidation are arising questions of great moment which must be faced and dealt with. We believe these questions should be solved along the line of regulations against abuses and not by radical legislation destructive of business interests. We pledge ourselves to enact such laws as will fully protect the interests of the people, and we strongly favor supplementing State legislation by national laws if found necessary."

The platform of the Democratic party indorsed the Kansas City platform of 1900 and the cause of bimetallicism. It also favored the initiative and referendum. A declaration was made in favor of government ownership of all transportation systems. The so-called banking trust was condemned. Henry M. Teller, United States senator from Colorado, was endorsed to succeed himself.

Legislature.—A special session of the legislature was called on January 27, 1902, to take action in regard to the law passed April 5, 1901, providing for a general revenue and tax system. This act had been contested early in June by the Atchison, Topeka and Santa Fé Railway, and other railway and telephone companies, and the law remained in litigation and no revenue could be collected under it. Both the State District Court of Pueblo County, and the United States District Court, had held the law to be unconstitutional, and the cases were then pending in the State Supreme Court and in the United States District Court. The board of assessors created by the law were enjoined from further proceedings, and it was therefore necessary, in order to collect revenue for 1901, that the legislature sanction the raising of taxes under the previous law of 1901. This sanction, verifying the assessments made by the old State board of equalization in expectation of such an act of the Assembly, was given on March 22, 1902, and the legislature then proceeded to draw up another complete revenue and tax law which, it was believed, would meet the objections of the courts.

Several extensive memorials were addressed by the legislature to Congress. These were, in general, in commendation of Rear-Admiral Schley, in advocacy of Filipino self-government, of the exclusion of Japanese labor, and in opposition to any retirement of the greenbacks, the redemption of silver in gold, the reducing of the currency or permitting banks in any way to regulate the currency. Opposition was also made to the admission of free sugar from Cuba. It was stated that four and one-half billion pounds of sugar were imported in 1901, of which one and one-fifth billion came from Cuba. Beet sugar, it was held, was supported by European governments. Free Cuban sugar would narrow Colorado's market, and the existing sugar tariff was the only one from which farmers and producers in the west directly benefited. As measuring in some degree the extent of this benefit, it was said that in 1899 the beet sugar product of California had been valued at \$100,000; in 1900 at \$1,125,000; in 1901 at \$3,600,000; and for 1902 it was estimated at \$6,000,000.

By a law of 1901 a State irrigation canal was authorized in Montrose and Delta counties, to be known as State Canal No. 3, and to extend from the Gunnison River below the mouth of the Cimarron River to the Enconpalyre River valley, and to have such laterals and branches as would irrigate the greatest amount of land. An amendment to this law was passed in 1902, giving the board of control who were to construct it more adequate power to issue certificates of indebtedness for money advanced, and in other ways to provide for its proper construction.

Single-Tax Campaign.—The attention of students of political economy was drawn to Colorado during the autumn of 1902 by what was practically a campaign for the single-tax. The "Bucklin amendment" to the State constitution was the issue. The proposed amendment, framed by State Senator James W. Bucklin, after a visit to Australia and New Zealand, provided for the adoption of the system he found

in operation in some parts of Australia—local option in taxation. Each county and city in the State was to be given power to determine its own method of taxation. It took a strong fight by the friends of the measure to get the legislature to submit it to the people, and its foes induced the governor to call a special session of the legislature to repeal the submission act. The legislature, after an exciting debate, refused to repeal it, however, and the campaign went on. The amendment was indorsed by the Socialists and the State Federation of Labor, and it became clear that if the proposed home rule in taxation were granted many localities would adopt the single-tax. After an exciting campaign the amendment was defeated.

Elections.—At the regular biennial State election held November 4, 1902, a full State ticket was elected, all but the superintendent of education being Republicans. For governor, Peabody (Rep.) received 87,512 votes, and Stimson (Dem.) 80,217, the Republican candidate having a plurality of 7295 votes. The State legislature for 1903 comprises 53 Democrats and 47 Republicans.

State Officers.—For 1902: Governor, James B. Orman (Dem.); lieutenant-governor, David C. Coates (Pop.); secretary of state, David A. Mills (Pop.); treasurer, J. N. Chipley (Sil. Rep.); auditor, Charles W. Cronter (Dem.); adjutant-general, G. F. Gardner; attorney-general, Charles C. Post (Dem.); superintendent of education, Helen L. Grenfel (Dem.). For 1903: Governor, James H. Peabody; lieutenant-governor, W. A. Haggott; secretary of state, James Cowie; treasurer, Whitney Newton; auditor, John A. Holmberg; adjutant-general, G. F. Gardner; attorney-general, Nathan C. Miller; superintendent of education, Helen L. Grenfel, all Republicans except the superintendent of education.

Supreme Court, in 1902 and 1903: Chief justice, John Campbell (Rep.); associate justices, William H. Gabbert (Dem.), and Robert W. Steele (Fusion).

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

COLORADO METHODISTS, exceeding in number 1,500,000, constitute a considerable part of the denominational family of Methodism. They are included mostly in the several distinct organizations maintained by the African race, though some other Methodist bodies have negro members. The more important colored Methodist churches are the *African Methodist Episcopal*, dating from 1816, with 6429 ministers, 5715 churches, and 728,354 communicants; the *African Methodist Episcopal Zion*, which was formally established in 1820, and now has 3310 ministers, 2985 churches, and 542,422 communicants; and the *Colored Methodist Episcopal*, founded in 1870, which includes 2061 ministers, 1433 churches, and 204,972 communicants. Among the denominations of the United States, these bodies rank, respectively, tenth, thirteenth, and twenty-first, in numerical strength. The Methodist Episcopal Zion Church has a publishing house in Charlotte, N. C., and issues eleven denominational publications and periodicals. Under its auspices are six colleges and seventeen minor schools. Its church property is valued at \$4,619,520. During 1902 several new church edifices were built in Chicago, Kansas City, Boston, and in Louisville and other southern cities where the denomination is strongest. The report of Bishop Levi J. Coppin, of the African Methodist Episcopal Church, who returned to this country after a year in Africa, was of considerable interest. Bishop Coppin succeeded in organizing in South Africa a branch of the church, including some twenty places of worship, the first having been dedicated early in 1901 at Arensdale, Cape Colony. At Cape Town was established Bethel Institute, an institutional church whose objects are less denominational than Christian and generally educational. The general conference of the Colored Methodist Episcopal Church was held in Nashville, Tenn., in May, 1902.

COLUMBIA UNIVERSITY, New York City, founded 1754. The event of the year 1902 that overshadowed all others was the election and inauguration of Nicholas Murray Butler, Ph.D., LL.D., as president to succeed Seth Low, who resigned in October, 1901. Dr. Butler, who had been acting-president since the opening of the 1901-02 session, was elected president on January 6, and was inaugurated on April 19 in the presence of a most distinguished assembly, including the President of the United States, governor of New York, mayor of the city, and the presidents of most of the American universities. President Butler's fitness for this position is especially marked, since he is recognized as one of the leading educational authorities in the United States. The immediate effect of this new leadership was seen in the marking out of a distinct educational policy for the university. The most important item in this policy is the proposition for the shortening of the collegiate course, a proposition discussed more fully in the article **UNIVERSITIES AND COLLEGES**. The proposition is that the course for the B.A. degree be curtailed to two years, including the so-called "liberal studies" only and eliminating all the introductory professional courses that now in large part comprise the course of the senior year. The four-year course is also allowed to stand, but it is proposed that the degree of M.A. be given for this.

Columbia University did not commit itself to this policy in 1902, but the policy is definitely suggested as one probable in the course of a few years. The proposed two-year course would include all the studies now prescribed and would make it possible to require the possession of the baccalaureate degree before admission to the professional schools without entailing a hardship upon the students, as is now done in the majority of cases where such requirements are made. Four other points in the educational policy, as outlined by the president in his first annual report, are: (1) The maintenance of educational efficiency, especially through the devotion of greater attention and support to undergraduate work; (2) the promotion of research, since the best teacher is a constant student, and the student tends to become an investigator, and since the work of investigation is the express function of the university; (3) the development of the social side of academic life, especially through a dormitory system, which is so much needed in a large city to preserve any community life in the college; and (4) the better organization of the teaching of the natural sciences, a necessity due to the manner in which the study of the sciences has grown up at Columbia through the influence of the School of Mines, where organization has been effected somewhat to the neglect of similar organization in the college itself. Preliminary to any great advance in the educational efficiency of the university, many financial needs must be met. The president in his annual report sets these forth as follows: To pay the existing debt, \$3,000,000; to purchase property upon which the university has an option until July, 1903, \$2,000,000; to build and equip a college hall, \$500,000; to complete and equip University Hall, \$1,000,000; to build and equip a law school building, \$400,000; to build and equip a building to accommodate departments temporarily in the Library Building, \$400,000; for general university purposes, including the most pressing needs of the Schools of Applied Science and the Medical School, \$2,700,000; a total of \$10,000,000. The gifts to the institution for the scholastic year 1901-02 amounted to \$1,082,581, divided as follows: To Columbia University, \$421,446; to Barnard College, \$403,290; and to Teachers College, \$257,844. The bulk of the fund to the university proper and to Barnard College was for endowments, while that to Teachers College was for buildings. In addition to this, Mr. John D. Rockefeller gave in October, 1902, \$500,000 to the endowment funds of Teachers College, conditioned upon the payment of the outstanding indebtedness of \$190,000 and the securing of an additional \$250,000 for endowments. These conditions at the end of the year were partially met and promised soon to be completely filled. The most important internal administrative changes of 1902 were the establishment of a school of fine arts, of which the department of architecture, formerly of the faculty of applied science, and the department of music, formerly of the faculty of philosophy, constitute the nucleus. Further changes separate anthropology from psychology, and education from philosophy, as independent departments. During the year the teaching staff increased to 425. Among the appointments were that of Felix Adler, Ph.D., as professor of social and political ethics; L. Emmet Holt, M.D., LL.D., professor of diseases of children; Frederick Hirth, Ph.D., professor of Chinese; Walter B. James, M.D., professor of the practice of medicine; John D. Prince, Ph.D., professor of Semitic languages; Julius Sachs, Ph.D., professor of secondary education; Charles Thaddeus Terry, B.A., LL.B., professor of law; Frederick J. E. Woodbridge, M.A., professor of philosophy; Henry L. Moore, Ph.D., and Henry Rogers Seager, adjunct professors of political economy.

The total registration in all departments of the university for 1901-02, including extension students, auditors, and students in the summer session, was 5134, as compared with a similar total of 4440 for the preceding year, this being a gain of 15 per cent. Of these, 831 were undergraduates, 508 were non-professional graduate students, 2509 were professional graduate students, 1902 were summer session, or extension, students or auditors. On November 7, 1902, the total registration in all departments, including extension students, was 4837, as compared with a similar total of 4499 at the same period of the preceding year. There was an increase of enrollment in every department except medicine, where the advanced admission requirements caused a considerable decrease in numbers. See *PSYCHOLOGY, EXPERIMENTAL* (paragraph Columbia University).

COMBES, JUSTIN LOUIS EMILE, who succeeded M. Waldeck-Rousseau as premier of France in June, 1902, has assumed power with the responsibility of carrying out the policy of his celebrated predecessor. This means a vigorous enforcement of the new Associations law, requiring the registration of religious orders; the further weakening of clerical influence by repealing the laws which, in 1850, gave ecclesiastical institutions privileges not enjoyed by the national schools; the establishment of pensions for the workingman, and of an income tax. This extensive programme has behind it a substantial Radical majority in the Chamber of Deputies. M. Combes, who was born at Roquecombe, department of Tarn, September 6, 1835, did not gain wide political recognition until comparatively late in life, but had

previously won distinction as a scientist, metaphysician, and opponent of clericalism. In his youth he was devoted to theological studies, and took orders in the Church. Subsequently he renounced the Church, and, having taken his degree in medicine in 1867, began practice at Pons, of which town he became mayor in 1875. Henceforth he gave attention to politics, though continuing his literary and scientific studies. In 1879 he became a member of the *Conseil Général*, and in 1885 was elected to the senate, to which he brought a scholarship, culture, and practical efficiency in the conduct of business that gave him a solid reputation in that body. After serving as vice-president of the senate (1893-94), he was chosen minister of public instruction in the cabinet of M. Bourgeois in 1895, and, after the overthrow of that cabinet, renewed his parliamentary activity in regard to the educational question. In his early life he published *Psychology of St. Thomas Aquinas*, and contributed to the *Revue Contemporaine*.

COMETS. See ASTRONOMICAL PROGRESS.

CONGO FREE STATE, a country of central Africa under the sovereignty of Leopold II., king of the Belgians, has an estimated area of 900,000 square miles and a population variously estimated at from 14,000,000 to 30,000,000. The white inhabitants are few, numbering in 1902 only 2346, of whom about 500 were resident at Boma, the capital.

Government and Finance.—Except as the administration is circumscribed by the provisions of the Berlin congress of 1885, the Congo Free State is an absolute monarchy. King Leopold at Brussels governs the country through a secretary of state, under whom are three secretaries-general for the departments of foreign affairs, finance, and the interior; at Boma the king is represented by a governor-general, and the fourteen districts into which the country is divided, are administered by Belgian commissioners. Under an act of August 10, 1901, Belgium continued her right to annex the country, at such time as the king might choose. The effective army numbers over 12,000 natives, commanded by European officers.

Revenue accrues principally from the state domain, customs, and transport dues. Estimated revenue and expenditure in francs have been, respectively, as follows (the franc equals 19.3 cents): 1900, 26,256,500 and 27,731,254; 1901, 30,751,054 and 31,256,054; 1902, 28,709,000 and 32,405,492. The public debt is stated at 166,226,635 francs; included in this amount is a loan of 50,000,000 francs issued in October, 1901, for the construction of railways and other public works. The Belgian act of August 10, 1901, relieved the Free State from interest payments on the two Belgian loans—one of 25,000,000 francs, made in 1890, and the other of 6,804,415 francs, made in 1895—until Belgium should renounce her right of annexation.

Production and Commerce.—The most important products and exports are rubber, ivory, palm-nuts, and palm-oil. Tobacco, resin, coffee, and cacao are also produced. It is stated that the number of coffee trees increased from 61,500 in 1895 to 2,631,000 in 1901, and cacao trees from 13,800 to 490,700.

The special imports and exports in 1900 were valued at 24,724,109 francs and 47,377,401 francs, respectively; general imports and exports, 31,803,214 and 51,775,978, respectively. In 1901 the special imports and exports amounted to 23,102,000 francs and 50,488,000 francs, respectively, and the general 26,793,000 and 54,008,000, respectively. The leading exports in the special trade in 1901 were: Rubber, 43,966,000 francs; ivory, 3,965,000; palm-nuts, 1,373,000; palm-oil, 802,000. The special imports to and exports from the Free State by countries of greatest trade importance were, respectively, in 1901: Belgium, 16,716,000 francs and 47,064,000 francs; Great Britain, 2,881,000 and 228,000; Germany, 1,059,000 and 125,000; Portuguese dependencies, 586,000 and 1,682,000.

Communications.—The Congo River is navigable as far as Matadi, twenty-seven miles above Boma and 112 miles from the Atlantic. From Matadi to Stanley Pool (Leopoldville) there are numerous rapids, and communication is effected by a railway 247 miles long, which was opened to traffic July 2, 1898. There is also a railway twenty miles in length between Boma and Mayumbe. Above Stanley Pool there are about 1000 miles of navigable water. In 1902 a concession was granted for the construction of a railway to be eventually a part of the line from Cairo to Cape Town. See CAPE-TO-CAIRO RAILWAY.

Administrative Outrage.—That the Congo State should be called "free" is an irony less amusing than tragic. For a number of years atrocities, attested by witnesses and other authorities who in large part must be regarded as trustworthy, have been perpetrated by the Belgian officials and their native troops. In the spring of 1902 the Aborigines' Protection Society, in behalf of the Congo inhabitants, appealed for intervention to the British government as one of the signatories of the Berlin treaty, which gave the state existence, and, according to the terms of which, Great Britain has clearly the right to intervene. To some extent the excuse for the deplorable conditions in the Congo is found in the governmental system established there. When the sovereignty of the country was placed with King Leopold, the first necessity

of the administration was revenue, but none of the usual sources of revenue was available and adequate. Accordingly all the wild land—probably nine-tenths of the whole area—was declared crown property: and for this small blame attaches to the Belgians; but in their manner of utilizing the property all the trouble has arisen. To various companies the government sold rubber monopolies, usually retaining for itself half the profits. But soon a difficulty arose: the natives had little liking for rubber gathering, and besides, as they would think, was not the rubber their own to use or not use as they chose? Then the government, resolved upon compulsion, called out the militia—savages and, in some instances, cannibals, provided with modern arms. "Their method" was to surround a village, order out its adults on a rubber hunt, and, if resisted, or if the rubber brought in was insufficient, to kill, mutilate, or in some instances, as the [Aborigines' Protection] Society affirms, *eat* the defaulters. If the natives fled they were hunted in the woods, and if they fought their heads or hands were brought into the stations in evidence that the resistance had been put down." In addition to this forced labor, amounting to practical slavery, many natives, it is said, have been sold into actual slavery, the worst crimes of the Arab slave-raiders being repeated. It is alleged that the occasional governmental reproof is directed only against minor officials, and that "so-called reforms are merely intended to throw dust in the eyes of the public."

CONGREGATIONALISTS are represented in every State of the Union, as well as in Hawaii, Cuba, Porto Rico, and in mission fields generally. The *Congregational Year Book* of 1902 records the statistics of the denomination as follows: Ministers 5717, churches 5753, members 645,994; Sunday school members 658,405; members enrolled in various young peoples' organizations, such as the United Society of Christian Endeavor, 198,407; benevolent contributions \$2,233,722; expenditures, \$7,580,665. The work of the church is conducted through seven societies. The *American Board* (see AMERICAN BOARD OF COMMISSIONERS FOR FOREIGN MISSIONS) is the oldest foreign missionary society in the United States; and the *American Missionary Association* (see MISSIONARY ASSOCIATION, AMERICAN) is interested in the religious and educational improvement of several classes among the people of the United States. The *Education Society* controls one theological seminary, four colleges, twenty-three academies, and ten mission schools, and assists 150 young men preparing for the ministry. The total receipts for the fiscal year 1902 were \$135,288. A notable event of 1902 was the establishment by the Educational Society of a seminary at Atlanta, Ga., intended chiefly for the ministers, and subsequently students, of the Congregational Methodist and Free Methodist churches in Georgia, Florida, Alabama, and Louisiana, which recently affiliated with the Congregationalists. The work of the *Church Building Society* consists in lending aid to churches already organized by other societies of the denomination. Its income for the year aggregated \$251,668. The *Home Missionary Society* is engaged in providing Christian education for the destitute and in helping congregations that are unable to support the gospel ministry. In the fiscal year 1902 it employed 1868 missionaries and expended \$293,064, besides the amounts disbursed by the fourteen auxiliary societies, making a total for home missions of \$548,677. At the annual meeting in Syracuse, it was announced that the society was free from debt for the first time since 1893. The committee of fifteen appointed in 1901 to consider the matter of an adjustment between the National Society and its State auxiliaries, made its report, recommending (1) "an annual conference of representatives of the auxiliary societies and the officers and executive committee of the Home Missionary Society, to be held at the annual meeting; (2) a limited representative governing membership for each of the home societies of the denomination." An amendment to the constitution in regard to the voting membership of the society also was adopted. The *Sunday School and Publishing Society* plays an important part in the pioneer missionary work of the church. Of 131 new churches reported in 1902, 51 had developed from Sunday schools established by this agency, and it aided 50 others. The national organ of the denomination, the *Congregationalist*, which in 1901 was transferred to the Sunday School and Publishing Society, has been improved considerably and its circulation has materially increased, yielding a good income which is devoted to the missionary work of the society. Funds to the amount of \$131,000 are in charge of the trustees of *Ministerial Relief*, and there are organizations in twenty-one States, thirteen of which possess invested funds aggregating \$226,968. There is a tendency among the societies to defer more to the State and local bodies for representation and control than to individual churches, an indication that Congregationalism, while not losing autonomy, is becoming more compact as a body. Other items of interest during 1902 were the employment, by several of the societies, of young men specially trained in administrative fields of missionary work; the appointment of new instructors in the theological seminaries at Bangor, Me.; Chicago, Ill., and Hartford, Conn., and the shortening of the course in the Yale Divinity School to two years for those who have pursued prescribed studies during

the senior academic year. The next session of the Congregational National Council, which is the representative body of the denomination and which meets triennially, will be held in Des Moines, Ia., in October, 1904. The officers of the council are: Moderator, Rev. Amory H. Bradford, D.D., Montclair, N. J.; secretary, Rev. Asher Anderson, D.D., Boston, Mass.; treasurer, Rev. Samuel B. Forbes, Hartford, Conn.; registrar, Rev. Joel S. Ives, Hartford, Conn.

CONGREGATIONAL METHODIST CHURCH, organized May 8, 1852, thus completed in 1902 its semi-centennial, which was appropriately celebrated. The publishing facilities of the church, as provided at the last quadrennial general conference (1901), are being improved; and there was in 1902 a considerable increase in the circulation of its official organ, *The Watchman*, edited and published by the Rev. Rolfe Hunt, D.D., at Milne, Ga. The Congregational Methodists have 398 churches and 400 preachers, and a membership of 22,000. The denomination is composed of both white and colored members, its negro adherents, over 300 in number, forming separate conferences. A pamphlet, *The Founders of the Congregational Methodist Church*, was issued in 1902.

CONGRESSIONAL LIBRARY, Washington, D. C., had on June 30, 1902, 1,114,111 printed books and pamphlets, 99,532 manuscripts, 64,921 maps and charts, 345,511 pieces of music, and 127,002 prints. The accessions for the year 1901-02 in all departments amounted to 204,947. The library force consists of 406 persons, of whom 231 are connected with the library service proper, 58 with the copyright office, and 117 with the care of the building and grounds. The expenditures for 1902 were \$578,585.97, and the appropriations \$583,667.77. The increased appropriation granted by Congress has enabled the library to secure a number of accessions to the corps of specialists. The increase of the force during the past two years has been chiefly in the catalogue division, which has now reached its maximum. Gifts in 1902 were numerous, but in general of ordinary material. No collection of great value and no money gifts of importance were received, but an interesting addition was a complete set of the codes and rites of China in 131 volumes, presented by the Hon. W. W. Rockhill, to whom the collection of Orientalia, now embracing nearly 10,000 volumes, is chiefly due. A new stack has been completed on the second floor, and the Smithsonian serials, to the number of 30,000 volumes, have been moved into it. The library and files of the United States Industrial Commission were deposited in the library, subject to the further orders of Congress. Considerable additions have been made to the collection of Swiss, Italian, Prussian, and Canadian documents. A special effort was made to secure reports of chambers of commerce throughout the world. Important purchases have been made of complete and partial sets of periodicals, and various papers of Salmon P. Chase have been acquired, including his journal, 1829-35 and 1861-63, and a diary for 1864; his letter-books for 1833-37 and 1867-68; his notes on Supreme Court cases of 1869; his political scrap-books and commonplace books; a large number of letters written to him, and copies by his secretaries of letters written by him. Notable accessions have been made to material relating to the United States navy. Among these are the letter-book of David Porter (1807-08), and the letter and muster books of the frigate *Alliance* (1782-83). In the copyright office, 84,345 entries of United States productions and 8633 entries of foreign productions were recorded. An important enterprise was inaugurated in November, 1901, under the charge of Mr. C. H. Hastings, in the distribution of printed catalogue cards for the co-operative use of other libraries. The publications of the library during the year include a list of books on Samoa and Guam; a list of books relating to trusts; a list of references on *Reciprocity*; *Debates in the Federal Convention of 1787*, held at Philadelphia, on the election of senators; a list on the *Philippines*, shortly to be issued by the war department as a supplementary volume to its *Gazetteer of the Philippines*, has been edited and in part completed, compiled by the Division of Bibliography. There were issued 415,911 books in the main reading room, and 31,831 for home use. The increase in the number of readers, compared with the preceding year, was 6488.

CONNECTICUT, one of the New England States of the United States, has a total area of 5612 square miles. The capital is Hartford. Connecticut was one of the thirteen original States. The population in 1900 was 908,355, while in June, 1902, as estimated by the government actuary, it was 944,000. The populations of the largest cities in 1900 were: New Haven, 108,027; Hartford, 79,850; Bridgeport, 70,996; and Waterbury, 45,859.

Finance.—The balance on hand in the treasury of Connecticut on October 1, 1901, was \$557,046.52. The receipts from all sources during the year were \$4,297,540.23 and the disbursements \$4,174,188.79, leaving in the treasury on September 30, 1902, \$680,397.96. The principal items of revenue and the amounts derived therefrom were: Inheritance tax, \$335,734.96; insurance fees, \$108,666.16; investments tax, \$155,278.10; tax on mutual life insurance companies, \$310,402.98; steam railroads

tax, \$984,918.37; tax on street railroads, \$238,922.50; tax on savings banks, \$445,721.77. The funded debt of the State at the end of the year was \$1,663,100. From this amount, however, should be deducted cash in the treasury to the credit of the civil list funds amounting to \$571,697.90, leaving a net State debt of \$1,091,402.10. During the fiscal year the debt was reduced in the amount of \$468,000, and between October 1 and December 31, 1902, additional bonds were redeemed in the sum of \$375,000. Receipts for the fiscal year were more than \$600,000 in excess of the previous year, and, during the last three fiscal years, State bonds were retired to the amount of \$1,557,000.

Industries.—Connecticut leads the States of the Union in the per capita value of manufactures, and in the number of patents issued per capita. According to the last report, one patent was issued to every 1203 of its population. The latest official industrial statistics cover the years 1900 and 1901. In 1900 the value of the manufactured products of Connecticut was \$181,912,383.12; in 1901 the value was \$175,553,935.35, a decrease of 3.5 per cent. The proportion of these values chargeable to labor was 25.4 per cent. in 1900 and 26.2 per cent. in 1901.

Railroads.—The report of the railroad commissioners of Connecticut for the year ending June 30, 1902, shows unprecedented activity in business. There are but four roads operating in the State—The New York, New Haven and Hartford; the Central New England Railway; the New London Northern Railroad; and the South Manchester Railroad. These four roads reported an aggregate capital of \$103,346,568.38, an increase of \$3,000,000 over the previous year. The capital stock per mile of track was \$67,543.24. The total funded debt of the companies was \$39,144,000, being the same as for 1901. The funded debt per mile of road was \$25,582.98. The current liabilities for the year amounted to \$6,637,594.30, or \$640,040.17 less than for the previous year. The gross earnings for the year ending June 30, 1902, were \$45,125,648.70, as compared with \$41,761,906.26 for the preceding year, an increase of 8 per cent. The passenger revenue was \$18,275,183.82, or \$1,132,968.24 in excess of that item for 1901. The passenger earnings per mile of road were \$8,681.33, and per train mile \$1.39. The freight carried amounted to 18,730,512 tons, an increase of 1,578,519 tons, or 9 per cent. The total freight revenue was \$22,088,944.40, an increase of \$1,867,144.44 over the previous year. The average receipts per ton mile were \$0.0145. The freight earnings per mile of road were \$9,815.14, compared with \$8,944.37 for 1901, and per train mile they were \$3.13. The taxes paid to Connecticut by these roads amounted in 1902 to \$984,918.37. The length of the main lines and branches in Connecticut was 1,013.35 miles. Auxiliary tracks and sidings raise the total mileage for the State to 1,836.68, an increase of only 6.15 miles over 1901. The total number of employees was 30,001, receiving \$18,223,913.06 in wages.

Labor Affairs.—The conductors and motormen of the Fairhaven and Westville Street Railroad Company of New Haven struck on August 5 because several men had been discharged. They demanded as condition for returning to work that "the Fairhaven and Westville Railroad Company recognize our union," and that the men who were discharged without cause should be reinstated. Traffic was suspended for four days, public sympathy being with the strikers. The services of the State Board of Arbitration were brought into requisition, and the mayor of New Haven supplemented their efforts by securing maintenance of the peace during the arbitration proceedings. On August 9 the men returned to work, their claims being practically conceded. There was no disorder or violence in the interval. The anger of the local unions was aroused by the action of Franklin T. Ives, who, it was alleged, refused to take part in the arbitration proceedings, although a member of the board. His resignation was demanded by the labor organizations of the State, but action was held over by the governor.

The State commissioner of labor, in his annual report, dated March 1, revealed the fact that there was a widespread practice among overseers of mills and factories of blackmailing applicants for work, compelling them to pay a sum down or agree to turn over a portion of any wages the applicants might receive, before their requests for employment would be considered. The evils of this oppression have hardly been equaled by the private intelligence offices.

Constitutional Convention.—The revised constitution adopted by the constitutional convention, which met on January 1, 1902, pursuant to the vote of the electors on October 7, 1901, was rejected on June 16, 1902, by a vote of 21,234 to 10,277. Both the small total vote, 15 per cent. of the registration, and the fact that every county voted against the revision, exemplified the general dissatisfaction of the people with the convention's work. The convention had been called mainly to modify those clauses of the existing constitution, unrevised since 1818, which, under the town representation rule, gave the control of the legislature to a small minority of the electors. This minority was estimated at not more than one-fifth of the voters for the Senate and not more than one-ninth for the House. In the latter body such inequalities existed as that, for example, giving two representatives each to the towns

of Union, Hartland, Killingworth, and Colebrook, having populations, respectively, of 428, 592, 651, and 684; and at the same time only two representatives each to the cities of New Haven, Hartford, Bridgeport, and Waterbury, having populations, respectively, of 108,027, 79,850, 76,996, and 51,139 (1902 estimates). Amendments introduced in the legislature in 1901 to place representation and population in some approximate proportion, failed to pass, and it was then agreed on the advice of Governor McLean and other prominent Republicans to call a general State convention. But as the convention was made to consist of one delegate from each of the 168 towns in the State, it represented almost exclusively the rural element, which is utterly opposed to constitutional revision. In addition to this, the rural forces were well organized under the leadership of D. T. Warner, while the advocates of representative reform acted without plan or concert. Some sixty plans for readjusting representation were offered to the convention; of these the least disliked was the so-called "one-and-sixty" plan. This scheme proposed to give each town one representative in the Assembly, and to increase the Senate districts, based supposedly on population, from thirty-six, as secured by a constitutional amendment in 1901, to sixty. This plan was carried through on March 13 by a vote of 85 to 66; but so much opposition to it developed in the press that a report of the committee of style on April 30, criticizing the phraseology of the article, was made the excuse for its reconsideration, and it never thereafter obtained a majority. The unrepresentative character of the convention is shown by the fact that the 85 votes for the "one-and-sixty" plan, represented, according to 1900 census figures, only 156,387 out of a population of 908,355, i.e., 16 per cent. of the population outvoted 84 per cent. in the convention. No other plan, however, was better liked, and it was only the absolute necessity of taking some action that led the convention on the day of its adjournment to adopt a scheme offered without previous consideration. This plan gave one representative to towns of 2000 population, and added one representative for every 50,000 increase in population. But this change suited neither the thirty small towns stripped of one representative each, nor the larger towns and cities allowed only one or two additional representatives, nor the thriving intermediate communities that gained nothing. For these reasons and because it was felt that a constitutional amendment effecting the same purpose in a better way might now be carried in the near future, the revision was rejected. But while the constitution thus failed, some of its articles indicated much-needed reforms. One of these was to allow proposed amendments to be submitted to the people after a majority vote in both houses, instead of as at present requiring first the amendment's acceptance by the house and then at the next session its reapproval by two-thirds of both houses. Another article prohibited members of the legislature from accepting any other public office, and still another gave the governor power to veto parts of appropriation bills. Finally it was proposed to prohibit the legislature from enacting special legislation. The desirability of this change is indicated by the fact that the legislature of 1901 passed 566 special acts, as against only 184 public acts.

Political Conventions and Platforms.—The Republican State convention was held at Hartford on September 17. The platform endorsed President Roosevelt's administration, and called for his nomination in 1904. Concerning Cuba and reciprocity the platform says: "We believe, with William McKinley and Theodore Roosevelt, in the policy of trade reciprocity as the natural supplement of tariff protection, and the key with which to unlock the world's markets for the surplus products of American fields and American mills. Especially we commend the President's efforts to perform a plain duty and obtain for this country a lucrative commerce by arranging a judicious reciprocity treaty with Cuba." Concerning the revision of the tariff, the opinion of the convention was expressed in the following words: "We believe, with Lincoln, Garfield, Blaine, McKinley, and Roosevelt, in a protective tariff that wisely fosters American industries and safeguards American wages. We oppose a general revision of the tariff at this time as both inopportune and unnecessary. If, in any schedule, import duties are found that have been notoriously perverted from their true purpose to the inordinate enrichment of corporations, monopolistic in fact or in tendency, we look to a Republican Congress to apply, in its wisdom, the needed corrective without impairing the principle of protection." In the matter of trusts and other combinations in restraint of trade, the platform said: "We believe that great aggregations of capital commonly called 'trusts,' while necessary for the economical conduct of large business and commercial enterprises, should be subject to such supervision, state or national, as will safeguard public and private interests."

Concerning State matters, the Republican platform said: "We declare our faith in the historical town system of Connecticut, but, recognizing the natural desire of the populous towns for increased representation in the House, we believe that changes which shall preserve the fundamental features of the present system and

at the same time satisfy more reasonable demands, should be effected, and that they can be accomplished by the regular process of constitutional amendments."

The Democratic State convention was held at New Haven on September 25. The platform favored an immediate and substantial reduction of the tariff on Cuban imports; the election of United States Senators by popular vote, the immediate repeal of all tariffs upon trust-produced articles, so as to prevent monopoly under the plea of protection; the stringent enforcement of all existing laws against trusts and the passage of such new laws as are required to supplement and give potency to existing statutes.

Elections.—At the municipal elections in April, 1902, a labor candidate was elected mayor of Hartford, one of the wealthiest cities in the Union. The successful candidate, Ignatius A. Sullivan, president of the Hartford Central Labor Union and of the Connecticut Federation of Labor, was the nominee of an independent organization, known as the "Economic League," and became, through negotiations of the League leaders with the Democratic leaders, the nominee of the latter party. Mr. Sullivan was a clerk in a clothing store. The platform of the League advocated public ownership of public franchises, free text-books in the public schools, the eight-hour day for public employees, and certain distinctive local measures. At the election, the Republicans were successful in securing three-fifths of the common council and the whole of the ticket except mayor. Mr. Sullivan received a majority of over 500 votes. He made a number of speeches during the campaign, in nearly all of which he declared that, whereas the workmen of Hartford did not expect or hope to gain control of the city affairs, they did insist that they ought to be at least consulted concerning the city's administration. This frank avowal aided in winning votes for him. After his election, the new mayor announced that he would administer his office impartially, and would confer with financiers and business men on all matters in which they were interested. The election of Mayor Sullivan was the third of a series of labor victories, the other two having been at Bridgeport and Ansonia. The mayor of Bridgeport, Dennis Mulvihill, was by trade a stoker, and the mayor of Ansonia, Stephen Charters, a carpenter. At the regular biennial State election, held on November 4, 1902, a full Republican State ticket was elected. The vote for governor was: Chamberlain (Rep.), 85,338, and Cary (Dem.), 69,330.

State Officers.—For 1902: Governor, George P. McLean; lieutenant-governor, Edwin O. Keeler; secretary of state, Charles G. R. Vinal; treasurer, H. H. Gallup; comptroller, Abiram Chamberlain; attorney-general, Charles Phelps (term, four years, January, 1903); auditors, W. A. Riley, James P. Bree; commissioner of insurance, Edwin L. Schofield—all Republicans except James P. Bree, Democrat. For 1903: Governor, Abiram Chamberlain; lieutenant-governor, Henry Roberts; secretary of state, Charles G. R. Vinal; treasurer, H. H. Gallup; comptroller, William E. Seeley (the terms of all the above ending in January, 1905); attorney-general, William A. King (term four years, ending January, 1907); auditors, W. A. Riley (term, four years, from July, 1903), James P. Bree (term, four years, from July, 1903); acting commissioner of insurance, Theron Upson—all Republicans, except James P. Bree, Democrat.

Supreme Court of Errors: Chief Justice, David Torrence; associate justices, Simeon E. Baldwin, William Hamersley, Frederic B. Hall, and Samuel O. Prentice—all Republicans, except Baldwin and Hamersley, Democrats.

CONNEMARA, First Baron. See **BOURKE**, **ROBERT**.

CONNOLLY, **JAMES B.**, an American writer, whose volume of sea stories, *Out from Gloucester*, was prominent among the publications of 1902, was born in Boston, Mass., October 28, 1868, and received his early education in the Boston public schools. After additional study, in engineering, at the Lawrence Scientific School of Harvard University, he worked from 1890 to 1895 with the United States Engineer Corps engaged on river and harbor improvements at Savannah, Ga. At the outbreak of the Spanish-American war he enlisted in the Ninth Massachusetts infantry, a volunteer regiment, and took part in the siege of Santiago. From 1898 to 1901 he was engaged as reporter and correspondent for various newspapers, and in 1901 began contributing to magazines. Mr. Connolly is the son of a New England skipper and lived many years in the Gloucester he describes, and his sea-tales, despite the technicalities of their nautical phraseology, have won a wide popularity for their freshness and vigor. His other published book is a story for boys, entitled *Jeb Hutton* (1902).

CONSTANT, **JEAN JOSEPH BENJAMIN**-, a French painter, died in Paris, May 26, 1902. He was born in Paris, June 10, 1845. He studied at the Ecole des Beaux Arts, and, as a pupil of Cabanel, first exhibited at the Salon in 1869 ("Hamlet and the King"), and, after visits to Morocco and the Levant, found his *métier* in Oriental subjects, brilliant in color and frequently colossal in dimension. These

include: "Moroccan Prisoners" (1875); "The Entrance of Mahomet II. into Constantinople, May 29, 1453," a canvas of heroic size, first hung in 1878 at the Exposition Universelle; and "The Last Rebels" (1880), generally esteemed his best work, and purchased by the State for the Luxembourg. From 1880 he painted chiefly portraits and mural decorations, among the latter, "Literature," "The Sciences," and "The Academy of Paris," panels for the New Sorbonne (1888). Several of his portraits of well-known Americans are in private collections in the United States. His "Justinian in Council" (1886) is owned by the Metropolitan Museum of New York City. He was the recipient of numerous medals and decorations, and was made an officer of the Legion of Honor in 1894. His advice to pupils was succinctly given: "Study nature and the old masters; go to the Louvre; and work, work, work!"

CONSUMPTION. See TUBERCULOSIS and CHARITY ORGANIZATION.

COOKE, LORRIN ALANSON, ex-governor of Connecticut, died August 11, 1902, at Barkhamsted, in that State. He was born April 6, 1831, in New Marlboro, Mass., was educated at the academy in Norfolk, Conn., and for a few years taught school and worked on a farm in Colebrook, Conn. He became a member of the State legislature at the age of twenty-five, was State senator in 1882 and 1883, was twice chosen lieutenant-governor, and was governor from 1895 to 1897.

COOPER, THOMAS SIDNEY, an English artist, at the time of his death the oldest member of the Royal Academy, died at Harkledown, England, February 7, 1902. He was born in Canterbury, September 26, 1803, and obtained his artistic training as a pupil of the Royal Academy, and in Brussels under Verboeckhoven. In 1833 he entered his first exhibits at the Royal Academy, of which he was elected an associate in 1845, and full academician in 1867. His most considerable achievements were in landscape and animal—particularly cattle—studies. For some of his animal subjects, F. R. Lee supplied the landscapes. Prominent among his works are: "Cattle at Pasture" (1843), "Snowed Up" (1867), "Passing Showers" (1870), and "In the Rob Roy Country" (1885). In 1882 he presented to Canterbury the Sidney Cooper Gallery of Art. He published the autobiographical *My Life* (1890). From 1833 he exhibited at the Academy consecutively for sixty-seven years.

COOPER UNION FOR THE ADVANCEMENT OF SCIENCE AND ART, New York City, founded by Peter Cooper, and chartered in 1857. The forty-third annual report, submitted May 31, 1902, shows a revenue and expenditure of \$93,530.25 and \$99,723.94, respectively, leaving, with a balance from the previous year, \$1,893.07 to the credit of the institution. Of the expenditure \$10,000 was for the reorganization of the classes and for the enlargement of the laboratories. The special endowments appearing in the balance sheet, amounting to \$2,133,159.30, consist of gifts and bequests, which, either by the terms of the original gift or by resolution of the board of trustees, are to be kept permanently invested and the income only made available for outlay. An expenditure of \$500,000 on the reconstruction of the building does not appear in the financial exhibit because of the fact that the entire expense of this work was defrayed by Edward Cooper, Sarah A. Hewitt, and Abram S. Hewitt, and is not included in the list of assets or endowments. Other gifts and assignments of funds of the Cooper family, supplemented by the gift of \$250,000 from a friend of the institution whose name at his request is not made known, have raised the endowment fund in the aggregate to over \$2,100,000, producing an income of at least \$90,000 a year, a sum that apparently justifies the trustees in devoting the entire building to educational purposes. During the year the number of pupils in the art schools, schools of science, stenography, typewriting, and telegraphy, was 2399; the number of visitors to the reading room and library 499,602, to the museum, 1582; attendance upon the free public lectures in the great hall, (estimated) 128,000; attendance in the small hall on lectures in ethics, literature, and political science, 20,000; so that during the year some 631,583 persons availed themselves of the various privileges of the institution. An interesting and successful feature of Cooper Union is its course of lectures in the great hall of the institute, in co-operation with Columbia University and the People's Institute. The officers in 1902 were: President, Edward Cooper; secretary, Abram S. Hewitt; treasurer, Edward R. Hewitt.

COPPER. The year 1902 was noteworthy in many respects for the copper industry. An attempt on the part of the largest producer in the United States to maintain prices at a high level in the face of a decreasing demand resulted disastrously; when the accumulation of stocks came into the market, the prices fell off rapidly and soon reached the low mark of 1898. There were temporary reactions toward a higher level from time to time, but the average price for the entire year was less than 12 cents per pound, as compared with over 16 cents in 1901. Notwithstanding the unsatisfactory trade conditions, the mining industry made considerable progress. In the Lake Superior region there was a very large increase,

which came mostly from new mines that will be a permanent factor in the industry. The possibilities of this region, first opened in 1844, are still enormous. The Montana and Arizona mines made little advance, but Utah, California, and some of the other copper-mining States added materially to their output of 1901. The consumption of copper, both at home and abroad, was commensurate with the increased production. All of the industries which use the metal in large quantities, especially the electrical industry, enjoyed unusual prosperity. A noteworthy feature of the trade was the increased importation of copper ores and crude copper for smelting and refining in this country; the material came from Canada, Mexico, Chile, and even from Australia. The output of copper in the United States in 1902 is estimated by *The Engineering and Mining Journal* at 670,000,000 pounds, in addition to which there was a production of about 100,000,000 pounds from foreign ores. The imports in metallic form were 103,129,568 pounds, and the exports 354,668,849 pounds. The output for 1901, as reported by the Division of Mining and Mineral Resources of the United States Geological Survey, was as follows:

	Pounds.		Pounds.
Arizona	130,778,611	Utah	20,116,979
California	33,667,456	Wyoming	2,638,712
Colorado	9,801,783	Other States	6,880,039
Idaho	480,511	Lead desilverizers, etc.	531,530
Michigan	156,289,481		
Montana	229,870,415	Total domestic copper.....	602,072,519
Nevada	533,608	From imported ores, etc	64,000,000
New Mexico	9,629,884		
South Dakota.....	753,710	Total domestic and foreign.....	666,072,519

Rich copper mines have been opened recently in Mexico, and there is every prospect that this country will soon make very important contributions to the world's supplies. New discoveries of copper ores were reported late in 1902 from the Copper River district of Alaska.

COREA, a constitutional monarchy occupying the peninsula between the Yellow Sea and the Sea of Japan. The capital is Seoul.

Area and Population.—The estimated area is 82,000 square miles, and the estimated population about 10,500,000. The estimated population of Seoul in 1902 was 193,606. The foreign inhabitants in August, 1902, numbered about 24,740, of whom 19,106 were Japanese, about 5000 Chinese, 275 Americans, about 140 English, 96 French, 43 Germans, and 30 Russians. Aside from the worship of ancestors, religion has small place in the lives of the people. The number of Roman Catholics at the end of 1901 is stated at 55,806 and of Protestants 27,980.

Government and Finance.—In 1902 the monarch was Yi Heui, who succeeded to the throne in 1864 and assumed the title of emperor on October 15, 1897. The central government is divided into ten ministries of state; all of the ministers have a seat in the cabinet, which, with the assent of the emperor, exercises both legislative and executive power. The corrupt system of administration was renovated and reorganized after the treaty of Shimonoseki was concluded in May, 1895, but there persists a strong reactionary tendency. The regular army, which since 1896 has noticeably increased in efficiency, numbers about 17,000. The men, who are recruited by voluntary enlistment, are said to be well paid and seemingly are excellent soldiers. Revenue accrues largely from the land tax. For 1901 the estimated revenue and expenditure were 9,079,456 yen and 9,078,682 yen, respectively; for 1902, 7,586,530 and 7,585,877, respectively. The yen is worth 49.8 cents. A currency difficulty became serious in 1902 through the government's flooding the country with a nickel coinage, the intrinsic value of which was only one-eighteenth of its face value, while there was no gold or silver redemption fund.

Industries and Commerce.—Agriculture, the principal industry, is retarded by primitive methods and insufficient means of communication. The leading crop is rice, and others of importance are beans, various cereals, ginseng, and tobacco. Gold is produced, and there is promise of other mineral exploitation. Foreign trade passes through the treaty ports, which since 1899 have been nine in number. By far the largest import is cotton goods; other imports are kerosene, metal wares, and silk goods. In years of normal production the largest export of merchandise is rice, followed by beans and ginseng. For 1898 the total trade, foreign and coast, was reported at 24,702,237 yen; 1900, 27,490,388 yen; 1901, 37,047,274 yen. In the last named year the foreign trade in merchandise amounted to 14,696,470 yen for imports and 8,461,949 for exports; in addition, precious metals and specie imported amounted to 2,446,014 yen, and exported 6,079,508 yen. The gold export has steadily increased from 1,390,412 yen in 1896 to 4,993,351 in 1901. The other leading exports in 1901 were: Rice, 4,187,000 yen; beans and peas, 1,890,000; hides, 650,000; red ginseng, 515,000. Japanese interests in Korean trade are constantly increasing.

Communications.—A railway under Japanese management is in operation between Seoul and the port of Chemulpo, 26 miles. The construction of a railway was begun on August 20, 1901, by a Japanese-Belgian syndicate, which intends to carry the line from Yong-Gong-Po, across the river from Seoul, to Fusan, 287 miles distant on the southeastern coast. On the paid-in capital the Japanese government has granted a 6 per cent. guaranty for fifteen years. In 1901 a French company contracted with the government to build a railway from Seoul to Wi-ju, about 350 miles distant on the northern frontier. It was believed that the loan of 5,000,000 yen arranged for by the government with a French syndicate on April 16, 1901, was for construction on this railway, but in March, 1902, the government declared the contract void through lapse of time and for other causes. On May 4, the Seoul-Song-do section of the railway was begun under the direction of M. Lefèvre, the chief engineer. There are reported 1696 miles of telegraph lines.

History in 1902—Although foreign influence, especially Japanese, has started the march of progress in Corea, the position of the country, political and economic, is unsettled. Early in January, revelations were made of embezzlements aggregating some 10,000,000 yen, misappropriated by about eighty officials during the six years preceding. The officials held that the money was taken in lieu of unpaid salaries, or to cover expenses incurred in the performance of their duties, but many were condemned and numerous executions were ordered by the emperor. Heavy taxation, aggravated by extortions of the collectors, provoked riots and even more serious outbreaks in various localities during the summer of 1902. There were also anti-foreign demonstrations. Corea continues a source of irritation and a potential cause of far more serious trouble to Japan and Russia. During the year there appeared to be a decline of Russian prestige. In February, against Russian protest, the Japanese Kato was appointed counselor of the court. Since Japan had been permitted to lay telegraphic cables along the Korean coasts, Russia, also in February, requested the privilege of constructing telegraph lines to connect her system at Wönsan (Yuen-san). Corea not only refused, but sent forces to destroy the lines already constructed across the frontier. And when pressed for compensation for this demolition, the Korean foreign minister refused to treat with the Russian minister, M. Pavloff. Although the latter had notified Corea that any attempt to interrupt the continuation of the telegraph line from Vladivostok to Wönsan would be followed by unfriendly relations between the two governments, Russia apparently yielded and proposed another route. A severe blow to Russian prestige was the Anglo-Japanese treaty of alliance of January 30, 1902, followed by the convention of July 25. Russia doubtless fears, through some circumvention of the agreement of 1900, the establishment by Great Britain and Japan of a naval station in southern Corea that would cut off Vladivostok from Dalny. What may be regarded as a corollary of the Anglo-Japanese alliance was the Anglo-Japanese-Corean agreement, reported from Seoul on July 25. According to this agreement, concluded by the British and Japanese ministers at Seoul and the Korean emperor's special adviser, who is a Japanese, Great Britain and Japan mutually guaranteed Corea's independence and pledged her their assistance in the settlement of any important questions, internal or foreign, that might arise; on her part, Corea promised that no foreigners should be appointed to the state service, that the government should immediately take measures, including the enlargement of the army and navy, for safeguarding its territorial integrity, and that foreign loans should be offered for subscription only in Great Britain, Japan, and the United States.

CORN. Despite an abnormal season, which it was feared would prove quite unfavorable to this crop, the production for 1902 in the United States reported by the department of agriculture, was one of the largest recorded. A portion of this apparent increase was attributable to a readjustment of the total acreage on which the estimates are made, in accordance with the census returns. These returns showed a greater area than had been taken into account by crop-reporting authorities, so that an arbitrary increase was made necessary to correct this error. The total production of corn reported for 1902 was 2,523,648,312 bushels, as compared with 1,522,519,891 bushels, the official figure for 1901, which was unusually low. The statistics given on the following page for 1902 are those of the United States Department of Agriculture.

The quality of the crop of 1902 was inferior over a quite important section of the corn belt. This was due to frost in the northern portion of the belt, and to continued rains, making the corn soft and causing it to mold. It has been reported that nearly 50 per cent. of the crop in Iowa was soft and not fit to market. This was fed on the farms to cattle and hogs, which do very well upon it. The average value of the corn crop per acre in 1902 was \$10.81, as compared with \$10.09 in 1901 and \$9.02 in 1900. The range for the past ten years has been from \$6.06 in 1896 to

\$10.81 in 1902. Naturally the value per acre varies widely in different States—in 1900 from \$4.48 in South Carolina to \$21.44 in Rhode Island.

The census reports have brought out some interesting figures as to the high yield of corn in Chester County, Penn.; Douglas and Edgar counties, Ill., and Clinton, Howard, and Tipton counties, Ind., which exceeded all other counties in the census year. These average yields ranged from 50.9 to 54.1 bushels of shelled corn per acre, which, considering the large acreage represented, is quite remarkable.

The world's corn crop in 1900, the latest year for which final quantitative estimates have yet been reported, was 2,822,900,000 bushels, of which 2,233,050,000 bushels were grown in North America, and 2,105,103,000 bushels of the latter amount in the United States. Nearly 75 per cent. of the total corn crop of the world, therefore, was credited to the United States, Austria-Hungary ranking next with less than 6 per cent. The remainder was distributed among seventeen different countries. The following data are available as to the corn crop of 1901 in foreign countries: Hungary 127,390,000 bushels, Austria 17,535,500, Roumania 116,945,000, Italy 95,176,500, Argentina 75,000,000, and Uruguay 5,576,000. The 1902 crop was estimated to be much smaller than that of 1901 in Hungary, Croatia-Slavonia, Roumania, Bulgaria, and Italy. In Roumania and Bulgaria the crop suffered greatly from drought and was estimated at only from 40 to 60 per cent. of the production in 1901. The official estimate for Italy is 67,395,000 bushels, about three-fourths of the normal crop, and the smallest production since 1897. The Hungarian minister of agriculture has estimated the world's crop for 1902 at 2,970,000,000 bushels. The short corn crop in this country in 1901 affected the exports not only of that grain but also

of oats, the other important feed grain, and in a less degree those animal products dependent on the corn crop. The exports of corn from the United States during the fiscal year ended June 30, 1902, were reported as follows:

COUNTRIES.	Bushels.	Value.	COUNTRIES.	Bushels.	Value.
United Kingdom.	10,030,459	\$6,177,209	Denmark.	1,267,434	\$683,008
Germany.	4,862,898	2,772,183	Belgium.	933,930	546,320
Canada.	3,209,677	1,895,773	Other countries.	2,095,082	1,379,174
Netherlands.	3,023,382	1,854,329			
Cuba.	1,213,690	877,587	Totals.	26,636,552	\$16,185,673

The exports for the preceding fiscal year (1901) amounted to 177,817,965 bushels, valued at \$82,527,983. The imports of corn in the fiscal year ending June 30, 1902, from Mexico, Canada, and British South America, amounted to 18,278 bushels, valued at \$13,418, as compared with 5169 bushels, valued at \$3418 the previous year. Exports of corn oil increased from 2,646,560 gallons in 1898 to 4,808,545 gallons in 1901, the latter valued at \$1,831,980. There has been a corresponding increase in corn oil cakes, most of which go to France. A recent census bulletin gives the value of the by-products from corn in starch manufacture at 20 cents per bushel of corn. The production of these by-products and of gluten meal and feed from the glucose factories has now reached enormous proportions, largely finding a ready sale at home for feeding live stock. The most important investigations on corn continue to centre around the breeding or selection of corn to improve the yield or composition. Much progress has been made in this direction, which is beginning to bear fruit in a practical way. Starting in 1896 with a corn containing 10.92 per cent. of protein (about the average), the Illinois Station has secured by selection corn with as high as 16.12 per cent. of protein. Similarly the fat has been increased from 4.7 to 7.4 per cent. The value of this corn richer in oil has increased, according to the statements of glucose refineries, 4 cents per bushel. The increased value for feeding of the corn richer in protein is even greater.

The census reports give the first data collected as to the use of corn stalks for feeding. The amount used in the census year is calculated at 4,759,369 tons. This, however, represents but a small proportion of the total amount, as it has been estimated that the average production in the corn belt States is not far from sixty million tons. This, it has been stated, would furnish about thirty-seven million tons of pulp stock from the stalks and twelve million tons of pith, which can be produced at less cost and sold cheaper than any other bleached stock known.

CORNELL UNIVERSITY, Ithaca, N. Y., founded 1868. The faculty in 1902 numbered 367, and the student enrollment was 3290, including the medical college in New York, an increase of 300 over the preceding year. The gross income was \$1,029,359, including a gift for the Rockefeller Hall of Physics, and other miscellaneous gifts, amounting together to \$365,935. Among the important faculty changes were the withdrawal of Dean White, appointed to the chair of German at Harvard, and the resignation of Professor Trowbridge and the appointment of I. V. Van Pelt in his place, as professor of architecture. H. H. Whig was appointed professor of animal industry and dairy husbandry, and P. A. Fish, professor of comparative physiology and pharmacology. The administration of discipline was put in the hands of a committee consisting of the dean and four professors. The university library was enlarged during the year by 12,020 volumes, and 2600 pamphlets, making a total of 261,852 volumes, and 43,000 pamphlets. The productive funds rose to \$7,577,633. Sibley College was enlarged by the erection of the central building. The new Stimson Hall, the gift of Dean Sage, is intended for the departments of physiology, anatomy, and histology. The chief problems of administration are those connected with the constantly increasing attendance. A new building for the arts department, a hall for physics, a laboratory of experimental engineering, a hall for the college of forestry, and a large building for physical training and social intercourse and for great university functions, are among the most pressing requirements. In anticipation of the erection of many of these buildings, the trustees have provided for the preparation of a plan for the development of the campus, by which the random selection of sites shall be avoided and the natural beauties of the grounds preserved. See **PSYCHOLOGY, EXPERIMENTAL** (paragraph Cornell University).

CORNU, ALFRED, a French physicist, died in Paris April 13, 1902. He was born March 6, 1841, at Chateaufneuf, and was educated at the Ecole Polytechnique and Ecole de Mines, becoming an engineer in 1866. In the following year he was appointed professor of physics in the Ecole Polytechnique. His first experiments of importance were the study of the velocity and propagation of light by a method similar to that of Fezeau, but involving greater refinements, and enabling him to

secure a much more accurate result. He also studied the spectrum and determined the wave lengths of the hydrogen rays, as well as investigating the ultra-violet end by original methods. The science of meteorological optics was enriched by his researches, which included a study of atmospheric absorption, and the explanation of the twilight glow as due to diffraction. He was the inventor of several important physical instruments, among which are the optical lever and a perfected Jellet prism for polarizing light. Professor Cornu contributed many papers on light and electricity to the *Comptes Rendus* and the *Journal de Physique*, and presided at the sessions of the International Congress of Physicists held in Paris in 1900. He was at different times a member of the Bureau des Longitudes, and the International Commission of Weights, and president of the Academie des Sciences and the Société de Physique. He was elected a member of the Royal Society of London in 1884, having previously (1878) received its Rumford medal for his researches on light.

CORPORATIONS. See FINANCIAL REVIEW, STRIKES, TRUSTS, and UNITED STATES STEEL CORPORATION.

CORRIGAN, MICHAEL AUGUSTINE, an eminent American Roman Catholic prelate, died in New York City, May 5, 1902. He was born at Newark, N. J., August 13, 1839, and graduated at the Mount St. Mary's College of Emmetsburg, Md., in 1859. He was one of twelve students with whom the American College at Rome was opened, was ordained priest in 1863, and from 1864 to 1868 was professor of dogmatic theology and sacred scriptures in the Diocesan Seminary of the Seton Hall College at South Orange, N. J. In 1868-73 he was president of the college, and in 1873 was appointed to the diocese of Newark. During his administration there was a marked increase in the number of new churches founded, while charitable work was greatly extended, and religious communities were established. In 1880 he became titular archbishop of Petra, and coadjutor with right of succession to the archbishop of New York, Cardinal McCloskey. In that dignity he conducted the chief part of the work of the archdiocese. He succeeded to the archbishopric of New York in 1885, and in the year following received the *pallium*. He made his archdiocese one of the most important and extensive in the Roman communion. He was a scholar of high and varied attainment, and, through his numerous beneficent activities, became, despite a characteristic unobtrusiveness, one of the best-known of American Roman Catholics. His administration was somewhat unfortunately disturbed by the long controversy between the Church and the late Dr. Edward McGlynn, the well-known advocate of the economic theories of Henry George.

COSTA RICA, a Central American republic and the most southern country of the North American continent. The capital is San José.

Area and Population.—The area has been estimated at 23,000 square miles. The estimated population in 1901 was 311,444. Most of the inhabitants of Spanish descent dwell in the towns; the rural population is largely mestizo. Immigration, though encouraged by the government, is small. The State religion is Roman Catholicism. Public education is free and actually compulsory.

Government.—The executive authority is vested in a president, who is elected for a term of four years by indirect vote and is assisted by a cabinet. The president in 1902 was Señor Asunción Esquivel. The legislative power devolves upon a chamber of representatives. The regular military and naval forces are inconsiderable.

Finance.—The monetary standard is gold, and the unit of value (since July 15, 1900) the colon, worth 46.5 cents. The revenue, which is derived chiefly from customs and excise, and the expenditure, of which the largest items are for administration and the internal debt, amounted in the fiscal year 1900 to 8,228,292 colones and 7,448,120 colones respectively, and in 1901 to 8,700,833 colones and 9,319,192 colones respectively. In 1901 the foreign debt was £2,080,000 (\$10,122,320); the internal debt, for the most part floating, was 7,759,713 pesos in 1902. In the payment of national obligations the government regards the peso, the former monetary unit, as of equal value with the colon.

Industries, Commerce, etc.—The leading crops are coffee and bananas. The total imports and exports, including coin and bullion, for the fiscal year 1900 (in gold pesos worth about 97.3 cents) were 6,084,898 and 6,321,196 respectively; for 1901, imports 4,411,402, and exports 5,792,679. The leading imports are cottons and other textiles and iron and steel goods. The percentages of the imports of merchandise (excepting live stock) by countries for 1900 and 1901 respectively are: United States, 46.20 and 46.77; Great Britain, 27.30 and 21.83; Germany, 13.59 and 13.50; France, 5.94 and 5.43. The coffee export in the fiscal year 1900 amounted to 16,218,954 kilogrammes valued at 3,800,188 pesos; in 1901, 16,707,119 kilogrammes valued at 2,823,-

291 pesos. Other important exports in the latter year were: Bananas, nearly 4,000,000 bunches valued at 1,741,570 pesos; precious metals, 721,548 pesos; cedar and mahogany, 229,252 pesos; hides, 109,849 pesos. There are 162 miles of railway.

A New President.—On February 17, 1902, Señor Asunción Esquivel was elected president to succeed Señor Rafael Yglesias, and on May 8 was inaugurated for the four-year term. Señor Yglesias became vice-president, but being severely attacked by the press he resigned, and was succeeded by Señor Ricardo Jiménez. The most important feature of the administration of Señor Yglesias, who had served two terms, was the adoption of the gold standard, which was begun by the act of October 26, 1896, and consummated with the issuance of the new gold coins on July 16, 1900. President Esquivel, who is regarded as an able lawyer, appointed the following cabinet: Minister of foreign affairs, justice, worship, and public instruction, Señor Leonidas Pacheco; interior, Señor Manuel J. Jiménez; finance and commerce, Señor Cleto Gonzáles Viquez; war and marine, Señor Tobías Zuñiga.

COTTON. As three-quarters of the world's production of cotton comes from the United States, it follows that American influences must prevail in the world's markets of this commodity although the remaining production has its effect in steadying prices and making good possible deficiencies. There is, however, to be noted the fact that the domestic consumption of cotton in the United States is increasing rapidly, and Europe must therefore consider that although the United States is producing large crops and increasing its acreage, yet its mills, particularly those in the Southern States, are using more of the raw material; and the indications are that with the large number of new mills in course of erection and projected the domestic consumption will increase rather than diminish as years go on. Realizing this, the various European colonial nations are making every effort to promote the cultivation of cotton in their dependencies. During 1902 attempts were made to raise cotton in sections of Africa where its cultivation had never before been carried on. Important experiments with this object were undertaken in Togoland and German East Africa under the direction of the German committee on colonial commerce, while in Lagos, Nigeria, and other colonies on the western coast of Africa experts sent out by British spinners and manufacturers have been considering the prospects for cotton growing, comparing conditions with those of Egypt, where cotton is raised with considerable success. Samples produced by experimental cultivation on a small scale in African colonies have been sent to Germany, where they have been examined with interest. The production of cotton in colonial countries and the increase of the Brazilian and Russo-Asian crops are matters to which European manufacturers must turn their attention in view of the high prices demanded for American cotton and the increased domestic consumption already mentioned.

For the season of 1901-02 the cotton production of the four leading countries was estimated at about 15,000,000 bales of 500 pounds each, apportioned as follows:

COUNTRIES.	Per Cent.	Bales.	COUNTRIES.	Per Cent.	Bales.
United States.....	73.04	10,701,000	Egypt.....	8.36	1,531,000
India.....	16.93	3,100,000	Brazil.....	1.07	300,000

Comparing the foregoing figures with those for 1869-70 it is seen that the quota of the United States increased from 56.44 per cent. (3,379,000 bales) to 73.04 per cent., and that Egypt increased from 5.71 per cent. (342,000 bales) to 8.36 per cent. On the other hand, the quota supplied by India is but 16.03 per cent., as against 33.15 per cent. (1,985,000 bales), while Brazil's production fell from 4.70 per cent. (281,000 bales) to 1.67 per cent. Looking now at the consumption of the 1901-02 crop it is found that 4,018,000 bales (37.27 per cent.) were taken by mills in the United States, while in 1869-70 the domestic consumption was but 777,000 bales, or 25.60 per cent. Great Britain and France, however, show a decrease from 48.6 per cent. to 28.26 per cent. in the case of the former, and from 11.43 per cent. to 6.37 per cent. in the case of the latter. In the same interval the aggregate amounts taken by the remaining European countries increased from 11.57 per cent. to 27.50 per cent. These figures are given by Mr. Theodore H. Price, the well-known cotton authority, and are interesting as showing the development of the cotton industry, particularly in the United States. They differ somewhat, however, from those given by the *Commercial and Financial Chronicle* in its cotton summary for the year ending August 31, 1902. These are as follows in bales of 500 pounds:

WORLD'S COTTON PRODUCTION.

COUNTRIES.	1900-01	1901-02	COUNTRIES.	1900-01	1901-02
United States.....	10,218,000	10,380,380	Brazil, etc.....	150,000	245,000
India and East Indies.....	2,200,205	2,300,000

Considering now the American production for 1902 we find that the prosperous conditions existing in the cotton trade led to the planting of a large area, estimated by the Department of Agriculture at 27,878,000 acres, an amount slightly in excess of that of the previous year (27,532,000 acres), and about 3,000,000 acres in excess of the average. This crop experienced excellent weather conditions, especially the rainy winter necessary to start the plants, and everything went well until June, when droughts came on. In Texas a severe drought was experienced in August, which caused the price to rise from 7.56 to 8.92 cents a pound, but the effects were not so bad as anticipated. Later in the year poor weather again occurred so that the price steadily rose, and on December 31, 1902, the closing for the year was 8.875 cents.

As regards the size of the crop of 1902-03 opinions differed at the end of the year. The crop of 1901-02, estimated at about 10,700,000 bales, was marketed at an average of \$41.01 a bale. The crop of 1902-03 was of about average size, being variously estimated at from 10,250,000 to 11,000,000 bales. According to the United States Census, which obtained returns from the various ginneries in the South, the quantity of 1902 cotton ginned up to and including December 13 was as follows:

STATES AND TERRITORIES.	Active ginneries reporting, number.	Cotton ginned to and including Dec. 13 (growth 1902), bales.	Ginners' estimate quantity to be ginned from this crop after Dec. 13, bales.	Canvassing agents' estimate percent. crop ginned to Dec. 13.

On this basis the crop would amount to 9,996,300 bales of a gross weight of 500 pounds, according to the ginners, or 9,954,106 such bales according to the agents of the census. It must be stated here that these figures were not the same as those given by the statistician of the Department of Agriculture, who, in December, announced the actual growth for the year as 10,417,000 bales of an average net weight of 490.7 pounds. Commercial opinions seemed to favor the latter figures, but considerable dissatisfaction was expressed at the discrepancies in the statements, and there was criticism of both departments.

Looking now at the use made of the crop of 1901-02, we find that in addition to the amount retained for domestic consumption Great Britain took 3,046,000 bales, France 751,000 bales, and the other continental countries 2,964,000 bales. The activity in manufacturing is shown by the number of spindles, and the following table, giving the statistics at the close of the year ending August 31, 1902, shows the increase in spindles in the various countries.

NUMBER OF SPINDLES.

	1900-01	1901-02		1900-01	1901-02

			Total, world... ..	108,856,771	110,348,974

The increase in cotton manufacturing in the southern States will be seen from the table. The larger part of the new cotton mills are being located in the South so as to be near the raw material and perhaps to secure the advantages of cheap and less thoroughly organized labor. In 1901-02 there were 570 mills in the South with 142,053 looms, as compared with 531 mills with 122,902 looms in the previous year. A large number of new mills were under construction, while extensive additions to old mills were being made.

Conditions in the manufacturing business in 1902 were good, for the most part, in America, and the mills were fairly active though there were complaints that the business was not sufficiently remunerative. In the spring there were demands for increased wages and many of the northern mills voluntarily increased wages by amounts varying from 6 to 10 per cent. In the South matters did not go so smoothly, and in April there was a strike at Augusta, Ga., with the result that the remaining mills in that city, as well as a number of mills in South Carolina, instituted a lock-out which involved about 10,000 employees. This was settled towards the end of May by the return of the operatives to work, though in certain instances later there were increases in wages.

In England the necessity of using an automatic loom was being recognized in 1902 and several new inventions were being considered, while the Northrup loom, which plays so important a part in American practice, was to be tried on a large scale. The cotton industry is not in a flourishing condition in England, and the works, which contain about 750,000 looms, are said to yield no substantial profits. In France, where conditions are somewhat more favorable than elsewhere in Europe, there was some slight activity during the year, but in Germany and Austria, owing to the general depression, the year's business was not good. In Italy there were somewhat better conditions than in the North, and the industry, especially on the export side, made steady progress. It was the general opinion that in Europe the machinery for spinning was in excess of the demand, and this was shown in the reduced number of orders for looms received by Manchester machine works. In Japan the number of spindles and the consumption of cotton are steadily increasing, the latter reaching 728,000 bales in 1901-02. Of this 163,000 bales came from the United States, which is an increase over the previous year.

Exports from the United States.—As China is an important market for cotton fabrics, the export trade depends to a certain extent upon political conditions in that country. Thus the trade, which fell off over half during the disturbed times following the Boxer uprising, was restored to its normal proportions, and in the fiscal year 1901-02, 335,000,000 yards were shipped to China, as compared with 84,000,000 yards in the previous year, and 182,000,000 yards in 1899-1900. It is interesting to note that 630,000,000 yards were shipped to China from Great Britain in the year 1901-02, as compared with 371,000,000 yards in 1900-01. The United States exports during the calendar year 1902 were larger than ever before. The following table shows the export of plain and colored cotton goods for 1901 and 1902:

	1901		1902	
	Yards.	Value.	Yards.	Value.
Colored goods.....	134,351,821	\$7,125,908	181,727,931	\$8,888,724
Uncolored goods.....	243,882,139	12,759,286	343,788,978	18,080,589
Total cotton manufactures.....	378,233,960	\$19,885,284	525,516,909	\$26,969,313

These exports were shipped to the following more important markets.

COUNTRIES.	1901	1902	COUNTRIES.	1901	1902
	<i>Yards.</i>	<i>Yards</i>		<i>Yards.</i>	<i>Yards.</i>
Chinese Empire.....	201,368,671	326,419,489	British Australasia	4,097,829	6,616,012
Africa	7,426,474	7,646,243	Philippines	1,300,382	6,366,099
Colombia	21,565,368	28,310,708	United Kingdom	9,542,127	5,586,787
British North America .	8,328,218	11,950,425	Mexico	3,89,422	3,129,454
Central America and Brit-			Cuba	4,470,542	3,530,775
ish Honduras	12,583,245	19,012,953	Venezuela	10,263,687	9,311,218
Other West Indies, etc ..	23,703,361	27,553,391	Hongkong	528,233	266,830
Brazil	5,445,878	9,017,024	Japan	668,822	351,987
British East Indies . . .	7,603,983	13,202,065	Other Asia and Oceania.	32,900,064	26,044,874

From these figures it may be seen that there was an increase in the exports of cotton cloth in 1902 except to the last seven markets named. The exports from the United States of other manufactures of cotton were valued at \$6,157,471 in 1901 and \$6,405,594 in 1902; so that the total values of cotton manufactures exported in the two years were \$26,042,755 and \$33,274,907 respectively. The exports of cotton manufactures to the Chinese Empire are far greater than those to any other country, amounting to \$10,349,379 in 1901 and \$16,102,905 in 1902.

Cotton Culture.—The United States Department of Agriculture has announced that “the development of cotton resistant to wilt disease is now an assured fact, and has been taken hold of by the planters on a large scale. Large tracts of land in the Sea Island district of South Carolina which had been abandoned on account of this disease were planted the past year successfully with resistant strains of cotton, and good crops produced.” The Bureau of Plant Industry has made many crosses of long-staple with upland varieties. “Several varieties of the ideal type desired have been produced, having larger bolls, very productive, with long, fine fibre, borne on smooth black seeds. The experiments of the past year show quite conclusively that these varieties can be made permanent.” Satisfactory progress was also made in 1902 in securing varieties of cotton resistant to the Texas root-rot. The Georgia Experiment Station concludes from observations covering eight years that large bolls, large seed, and a high percentage yield of lint are closely related to the greatest value of the total product of lint and seed. Egyptian cotton is reported to have been successfully grown in southern Georgia, the yield being larger than that of short-staple cotton. The Cawnpore Experiment Station in India has found that American long-staple varieties can be successfully grown in northern India. In one of the cotton-growing districts of Bokhara the use of American cotton seed was found to increase the yield of cotton, as compared with the native seed. This increase was so marked that the government raised the tax or rent from one-third of the crop from native seed to one-half of the crop from American seed. The German government is conducting experiments in cotton growing in Togoland and German East Africa. Experts have pronounced samples of cotton from Togoland as good and promising. The first shipment of Egyptian cotton, consisting of four bales, arrived at Hamburg from German East Africa about the close of 1902. The product is of a brownish yellow color and the fibre is long and silky. It is reported that this cotton was grown under the direction of American experts engaged by the German government to instruct the natives in cotton culture. An important recent book on cotton culture is a general treatise entitled *Le Culture du Cotonier*, C. Farmer, Paris, 1901.

COURT TENNIS. See RACQUETS AND COURT TENNIS.

CREELMAN, JAMES, an American author and war correspondent, published in 1902, *Eagle Blood*, a novel vividly portraying scenes in the making of the modern newspaper. This work added to his reputation gained by *On the Great Highway* (1901), a description of the experiences of a special correspondent. Mr. Creelman was born in Montreal, Canada, November 12, 1859. He entered the service of the New York *Herald* in 1877, and was later made editor of its London and Paris editions. As correspondent for the New York *World* he reported the Chino-Japanese war of 1894 and gained prominence by his description of the massacre at Port Arthur. He was similarly employed by the New York *Journal* during the Græco-Turkish war of 1897 and the Spanish-American war, and attained considerable distinction during the operations before Santiago by personally capturing the Spanish flag and commandant of the El Caney fort. He served also in the Philippines as a voluntary aide to General Lawton. In his various campaigns he was several times seriously wounded. He has interviewed Pope Leo, the King of Corea, King George of Greece, and other equally inaccessible personages. In 1902 he was the Washington editorial writer for the New York *Journal*.

CRETE, a Mediterranean island constituting an autonomous state under the suzerainty of Turkey. The capital is Canea.

Area, Population, Industries, etc.—The area is 3,326 square miles. Revised figures of the census of June 17, 1900, show that the inhabitants on that date numbered 310,362, of whom 271,585 were Greek, 31,955 Mohammedan, and 726 Jewish. There were 6096 foreigners. The Mohammedan population is chiefly in the towns of Candia, Canea, and Retimo. All the inhabitants speak Greek. In 1901 there were 321 communal schools with 35,540 pupils.

Agriculture, though the principal industry, is neglected. The chief product, olive oil, and soap are the leading exports. Imports and exports in the fiscal year 1899 amounted to 12,351,105 drachmai (19.3 cents each) and 6,600,198 drachmai respectively; in 1900, 11,076,055 and 5,590,436 respectively; in 1901, 14,448,000 and 7,286,000 respectively. The commerce is largely with Greece and Turkey. Railway construction is in progress.

Government and Finance.—By the constitution of April 28, 1899, executive authority is vested in the high commissioner, Prince George, second son of the King of the Hellenes. He, however, was appointed high commissioner (for a term of three years) by the Powers on November 26, 1898, assumed office on the 21st of the following month, and was reappointed December 15, 1901. He is assisted by a council. The legislative power devolves upon an assembly, mostly elective, in which Mohammedan representation is assured. Questions concerning foreign relations are determined by representatives of the four protecting Powers—Great Britain, Russia, France, and Italy—at Rome. Estimated revenue and expenditure for the fiscal year 1901 were 6,471,860 drachmai and 6,281,277 drachmai respectively; for 1902, 6,263,195 and 6,994,255 respectively. The public debt in 1902 amounted to 3,364,000 drachmai. By a convention of August 6, 1901, signed by the Cretan government at the instance of the protecting Powers, Crete agreed to pay 1,500,000 drachmai and concede for twenty years the working of the salt monopoly to the Ottoman Debt Commission, which therefor renounced all rights and privileges in the island.

Ever since the establishment of Cretan autonomy in 1898 there have been recurrent rumors that the Powers would agree to the annexation of the island to Greece. It was reported in February, 1902, that the annexation movement was making considerable progress and that the Cretan party favoring independence had "practically collapsed under popular and official disapprobation;" and another rumor of annexation was current in the fall of the year. It seems unlikely, however, that this will soon be effected. In the first place the independence party has not "collapsed." It still urges that the existing régime produces heavier burdens than Crete can well bear, and maintains that if the island were free the people would work more energetically in the interest of administrative organization and industrial development. There seems to be some basis for these arguments, but it must be remembered that the Powers cannot consent to the independence of Crete without affronting Turkey perhaps to the point of precipitating war. But for this same reason the Powers cannot intervene in the interests of the annexationists. The latter in support of their programme hold that Crete can make no favorable progress on her own resources, and that her only hope is closer relations with Greece, a country for the most part akin to her in blood, language, and religion. But aside from the initial difficulty with the Sultan it is pointed out that Greece herself is in no condition to grant material aid to Crete. Since the settlement of the Græco-Turkish war of 1897 Grecian finance has been superintended, or at least guarded, by representatives of the Powers, and it is not likely that Greece could be of any real assistance to Crete in matters financial, industrial, or political. The protecting Powers do not care to disturb the *status quo*, while the governments at Berlin and Vienna, desiring to humor the Porte as far as possible in order the better to advance their own interests and to interfere with those of Russia in the Near East, would hardly pass without protest such a blow to the Turk. It is generally conceded that Crete must be content with the position given her after the war of 1897, and that complete independence cannot come until her own resources and power are much greater than at present, or the strength of the Ottoman empire has failed. See ARCHÆOLOGY.

CRICKET maintained, in 1902, its gradual increase of popularity in the United States, being followed with greater enthusiasm and played by more associations than ever before. There were two important international matches, one the annual meeting between the United States and Canadian teams, and the other between Lord Hawke's English team and an eighteen selected from the California Cricket Association. The former match was played at Philadelphia September 12-13, and was won by the American team by an inning and 104 runs. In the other, which was played at San Francisco on November 26, the visitors won by 3 wickets and 30 runs. The inter-city matches, between New York and Philadelphia, were won by the latter in two meetings, at Philadelphia on August 2, by 3 wickets and 22 runs and at Bayonne, N. J., on August 30, by 42 runs. In the Veterans' Match (players over forty years), the All-Philadelphia team beat All-New York at Brooklyn on June 19, by 80

runs. In the Metropolitan District League the championship was won by the Knickerbocker Athletic Club, with 9 victories of 12 games played.

CRIME. The list of crimes in the United States compiled by the *Chicago Tribune* puts the number of murders and homicides for 1902 at 8852, an increase of nearly 1000 over 1901. Of these, 6307 were due to quarrels and 540 to jealousy. A remarkable feature was the great increase in the number of murders committed by robbers, 338 compared with 193 for 1901. During the year 141 persons were executed, 26 more than in 1901. The greatest increase in the number of executions was in the Southern States—seventeen as against seven in the States of the North. Hangings numbered 101 in the South and 43 in the North. Eighty-five negroes, two Indians, and one Chinaman were executed. Mississippi leads in the number of executions with twenty-two, and Arkansas and Pennsylvania follow with ten each. There was a marked decrease in the number of lynchings during the year, which may be taken as significant of a more popular regard for regular legal processes. The total of 96 in 1902, 39 less than in the year previous, is the smallest number recorded since 1855. The lynchings were distributed as follows: Alabama, 5; Arkansas, 5; Colorado, 1; Florida, 4; Georgia, 8; Illinois, 2; Indiana, 1; Kansas, 1; Kentucky, 9; Louisiana, 11; Michigan, 1; Mississippi, 11; Missouri, 5; North Carolina, 4; Oregon, 1; South Carolina, 3; South Dakota, 1; Tennessee, 5; Texas, 7; Virginia, 4; West Virginia, 6; Wyoming, 1. Eighty-seven occurred in the South and nine in the North. Of the victims, 86 were negroes, 9 whites, and 1 Indian. One woman was lynched in South Carolina. The alleged crimes were: Murder, 37; criminal assault, 19; attempted criminal assault, 11; attempted murder, 4; other offences, 19; unknown, 6.

There were 8231 suicides in the United States in 1902, an increase of 986 over 1901. The rate is increasing steadily. Frederick L. Hoffman in the *Medical Record* gave the rate for the decade 1891-1900 as 15.7 per 100,000 in the principal cities. In 1901 the rate was 16.6. St. Louis had the highest rate (25.7) and Fall River the lowest (2.9). A remarkable fact is the great increase in the proportion of women to men. Three times as many women committed suicide in 1902 compared with 1901. Dr. Arthur MacDonald shows that there is much reason for holding that crime of all kinds is increasing in the United States, and that it is increasing most rapidly in the North, where educational advantages are greatest.

The report of the prison commissioners of Great Britain states the number of prisoners per 100,000 of population in England as 621, in Ireland 744, and in Scotland 1487. The report shows some increase of crime in England and Wales. For the year ending March 31, 1902, there were 193 more convicts sentenced to penal servitude and 17,163 more imprisonments than in the previous year; while the daily average population of local prisons was the highest since 1885. There has been a great decrease since 1878, however, when the local prison population was 83.2 per 100,000, against 50 for 1902; and the convict prison population was 45.3 against 8.2 for 1902. The Boer war with the consequent increase in the number of men under arms accounts for some of the increase. Better policing has much to do with it. The enactment of new laws may have had some effect, and it is also suggested that "an increase of population pressing against the means of subsistence" is another cause. The commissioners propose that the professional criminal shall be isolated from other criminals and detained indefinitely, until those in charge may deem it safe to set him at liberty. The method followed at Borstal prison is recommended. The youthful criminals from sixteen to twenty are separated from the hardened criminals, subjected to stern discipline and hard work; and on discharge are carefully supervised until they have shown themselves worthy of liberty.

CROATIA AND SLAVONIA, a division of the Kingdom of Hungary, situated northwest of Bosnia, have an area of 16,773 square miles, and a population (1900) of 2,416,304. Agram (Zágráb) is the capital, with 57,690 inhabitants. The country is under the direct control of the Hungarian crown, represented by a viceroy (banus) responsible to both the Hungarian ministry and Croatian diet. There is autonomy in home affairs, an elected diet, and local representative assemblies. The diet sends forty members to the Hungarian parliament, and there is always one Croatian member in every Hungarian ministry. Revenue and expenditure balanced in 1900 at 18,576,165 kronen. The expenditure of the Hungarian government for the administration in Croatia and Slavonia, according to the budget of 1902, amounted to 16,540,741 kronen. The krone is worth 20.3 cents. Agriculture is the principal industry, wheat, rye, barley, oats, maize, and potatoes being the chief products. Coal, iron, and salt mines are worked.

From August 31, 1902, to September 3, serious riots took place at Agram, between the Croatian and Serbian elements of the population. Many houses were wrecked, over 100 persons injured, and quiet was restored only after martial law had been declared and the mobs overawed and dispersed by the military. The cause of the trouble appeared to lie in the jealousy, partly religious and partly political, existing

between the Catholic Croats and the Orthodox Serbs. Severe earthquake shocks occurred in Croatia on January 15 and 16, and May 13, 1902.

CROKE, Most Rev. THOMAS WILLIAM, a Roman Catholic archbishop of Cashel, Ireland, died July 22, 1902, at Thurles, Ireland. He was born May 19, 1824, near Mallow, County Cork. After studying for the priesthood at the Irish College in Paris, he attended the College of Merrin in Belgium, where for a while he taught English, rhetoric, and philosophy. In 1845 he went to Rome and finished a brilliant scholastic career with further theological studies. Soon after his return to Ireland he was appointed a professor at Carlow, the oldest ecclesiastical college of the country. In less than a year he was called to the chair of theology at the Irish College in Paris, but returned in 1848 to his native diocese of Cloyne, with which he was connected for over twenty years as missionary priest, parish priest of Doneraile, and chancellor of the diocese, except for seven years during which he was president of St. Colman's College in Fermoy. In 1870 he became bishop of Auckland, New Zealand, and in 1875 was appointed bishop of Cashel and Emly. He was considered the most able Irish ecclesiastic since the death of Cardinal Cullen. Active in temporal as well as ecclesiastical affairs, he exercised a wide influence in Irish politics as an anti-Parnellite and a member of the Land League.

CROQUET is played in the United States under the name of Roque (*q.v.*).

CROSLAND, T. C., author of *The Unspeakable Scot*. See LITERATURE, AMERICAN AND ENGLISH.

CUBA, an American republic occupying the largest island in the West Indies, was formally established as an independent government May 20, 1902. The capital is Havana.

Area and Population.—No accurate survey of the island has ever been made. Its area is given by the United States Coast and Geodetic Survey at 46,575 square miles, while the information division of the War Department estimates it at only 44,000 square miles. The population of Cuba, according to the census taken by the United States military authorities in 1899 was 1,572,797. Of this population native whites made up 57.8 per cent.; foreign whites, 9 per cent.; negroes and mixed races, 32.3 per cent., while the Chinese were less than 1 per cent. According to the same census, the six provinces into which Cuba is divided for administrative purposes have areas and populations as follows: Havana, 2772 square miles, population, 424,804; Matanzas, 3700 square miles, population, 202,444; Pinar del Rio, 5000 square miles, population, 173,064; Puerto Principe, 10,500 square miles, population, 88,234; Santa Clara, 9560 square miles, population, 356,535; Santiago, 12,468 square miles, population, 327,715. The school census for 1902 shows a population between six and eighteen years of 400,000, 70 per cent. being white.

Establishment of the Cuban Government.—On May 20, 1902, the Cuban government was formally inaugurated in accordance with the terms of the Platt amendment. This amendment, inserted in the army appropriation bill of March 2, 1901, directed the President to withdraw the federal authority from the island so soon as a Cuban government was established under a constitution, which, in stipulated terms, safeguarded the interests of the United States and insured so far as possible the stability and permanence of the new insular authority and sovereignty. The constitution proper was adopted by the constitutional convention on February 21, 1901; the exact terms of the Platt amendment were accepted and added to the constitution on June 12, 1901; an electoral law was promulgated by the military authority on October 14, 1901, and under this law elections were held on December 31, 1901 for presidential and senatorial electors, and for members of the house of representatives, governors of the provinces, and members of the provincial councils. The electors cast their votes on February 24, 1902, the Congress was convened on May 5, 1902, by military orders of April 14, 1902, to examine into the credentials of their several members and to count and ratify the electoral vote, and on May 20, 1902, the constitution was officially promulgated and the insular government transferred from the military authority of the United States to the officials and people of the Republic of Cuba.

The peculiar relation in which the United States stood to Cuba in view of the Platt amendment and the Treaty of Paris, and the desire of the United States to start the government in full organization and activity, made certain conditions and agreements necessary to the transfer, of which the more important were as follows: (1) It was expressly understood that the obligations assumed by the United States with respect to Cuba under the Treaty of Paris, and which among other things safeguarded the personal, civil, and property rights of resident Spaniards, should with the transfer of government be assumed and undertaken by the Cubans. (2) In order to prevent any break in the continuity of legal order, jurisdiction and administration, it was agreed that while the responsibility of the United States for the collection of revenue, the administration of law and the conduct of the insular employees should

TOMAS ESTRADA PALMA

Photo by H. H. Moore, N. Y.

cease, yet all the decrees and orders of the military government should remain in force and all the subordinate officials of the military government should remain in office until change was made by the proper authorities. (3) That the coast defenses might be cared for, and that the island might not be left entirely defenseless, a small body of artillery, less than 900 all told, would be left in the fortifications at Santiago, Cienfuegos, and Havana. These forces were to remain until the Cubans substituted their own, and until the naval stations to be acquired by the United States in Cuba had been agreed upon. Legally, the troops would occupy a position of extra-territoriality, as that of war vessels visiting the waters of another nation; freedom of transit was granted them, and they on their part were especially directed to render appropriate military honors to the Cuban flag and to avoid "even the appearance of interference in governmental or political affairs." (4) The measures which had been devised by the military government for the sanitation of cities and the prevention of epidemics were to be continued. These included: Contracts for the sewerage and paving of Havana and for the sewerage of Santiago; plans for supplying Santiago with water; the sanitary regulations in force in Havana; and the rules established January 17, 1899, and extended April 29, 1902, for the maintenance of quarantine against epidemics at Havana, Matanzas, Cienfuegos, Santiago, and other places as occasion might require. (5) That the Isle of Pines would remain *de facto* under the jurisdiction of the Republic of Cuba, subject to such treaty as might be entered into between the United States and Cuba in conformity with the terms of the Platt amendment.

In commenting upon these arrangements for the continuance of the existing legal and administrative system without abrupt change, the secretary of war pointed out in his annual report for 1902, that the whole situation had been quite unprecedented "with its curious device of a suspended sovereignty given up by Spain, but not in terms vested in anybody else, and if vested, remaining dormant, while a practical working government of military occupation in time of peace, deriving its authority from the sovereignty of another country, claimed temporary allegiance, made and enforced laws, and developed a political organization of the Cuban people to take and exercise the suspended or dormant sovereignty." If the old government had waited for the new government to pass laws and appoint officers, a period of anarchy would have ensued for "the instant that the new government was created the intervening government ceased." As it was, and through "the most perfect understanding, mutual confidence, and sympathetic cooperation between the outgoing and incoming officials the government which, until noon of May 20, was proceeding under the authority of the President of the United States, went on in the afternoon of that day and has ever since continued under the sovereignty which had been abandoned by Spain in April, 1899, without any more break or confusion than accompanies the inauguration of a new President in the United States."

Finances.—The following table, prepared by the secretary of war, shows the Cuban revenues and expenditures during the period of American occupation, from July 18, 1898, to May 19, 1902:

REVENUES.

	Customs.	Postal.	Internal.	Miscellaneous.	Total.
July 18, 1898, to June 30, 1899					
Fiscal year 1900	\$7,228,460.60	\$151,585.40	\$347,431.89	\$234,345.66	\$7,961,823.55
Fiscal year 1901	16,068,035.90	258,148.03	884,783.29	175,308.15	17,386,275.37
July 1, 1901, to May 19, 1902	15,950,526.91	367,950.60	658,585.92	184,003.23	17,161,066.66
Total	\$32,247,023.41	\$5,113,684.03	\$1,890,801.10	\$519,657.04	\$39,770,165.58

EXPENDITURES.

	Customs.	Postal.	Miscellaneous.	Total.
July 18, 1898, to June 30, 1899				
Fiscal year 1900	\$372,732.57	\$223,492.75	\$5,192,118.57	\$5,788,343.89
Fiscal year 1901	841,376.59	494,539.09	14,325,460.79	15,661,385.47
July 1, 1901, to May 19, 1902	910,993.66	524,198.85	16,210,376.00	17,645,568.51
Total	\$2,912,326.06	\$1,622,620.03	\$35,727,955.36	\$39,262,901.45
Total excess of revenues over expenditures				\$1,792,109.52

When General Wood turned over the government of Cuba to the duly elected civil

authorities, there was in the treasury, according to his statement, a balance of \$681,191.02, which was reduced to \$539,984.99 by later computations.

On December 31, 1902, five months after the inauguration of the government of the republic, the balance on hand in the treasury amounted to \$1,561,942.06. The receipts of the Cuban treasury up to the close of 1902 were as follows: From May 20 to 31, \$416,953.39; June, \$1,373,641.84; July, \$1,552,638.13; August, \$1,239,048.34; September, \$1,599,401.89; October, \$1,610,196.48—total, \$7,788,880.07. The average monthly expenses during this time were \$1,295,428.48, or about \$147,063.62 less than for the same period of the preceding year. The budget for the fiscal year 1903-04, which was submitted to the Congress November 1, 1902, by President Palma, estimated the total revenues at \$17,514,000 and the expenditures at \$14,899,967.72. The budget in detail was as follows:

RECEIPTS.		EXPENDITURES.	
From customs duties.....	\$14,781,000	For the legislature.....	\$413,319.68
From tax on spirits.....	1,200,000	For the executive.....	85,700.00
From the consular service.....	250,000	For the departments of State and Justice.....	310,393.00
From internal revenue.....	500,000	For the department of Government.....	4,529,998.00
From communications.....	420,000	For the department of Finance.....	1,801,117.88
From state property.....	119,800	For the department of Public Instruction.....	3,721,790.84
From other sources.....	243,200	For the department of Public Works.....	2,923,011.82
Total.....	\$17,514,000	For the departments of Agriculture, Industry and Commerce.....	165,319.50
		For the department of Justice.....	943,314.00
		Total.....	\$14,899,967.72

The aggregate revenue of the Cuban municipalities during the fiscal year ending June 30, 1902, was \$4,270,000, of which \$1,349,000 was derived from the tax on incomes from land and improvements, and \$1,262,000 from the tax on industries and occupations. The remaining \$389,000 was raised from sixteen other sources, the most important two of which were a carriage and transportation tax and a license fee required of peddlers and vendors in the public highways. Urban property paid \$1,034,000, and rural property \$315,000 of the land tax. Of the 128 municipalities in the island at the close of the fiscal year 1902, only 36 had standing debts of any kind. Exclusive of the city of Havana, which had \$10,000,000 (Spanish gold) in 6 per cent. bonds outstanding, there was no bonded indebtedness and the total interest charge was less than \$5000. The total floating debt of all the municipalities was \$170,000, against which the local treasuries held \$152,000 in cash and \$542,000 in credits for back taxes and other unpaid revenues.

Education.—Of the entire population of school age (400,000) in Cuba, 47 per cent. were enrolled during 1902 and 24 per cent. were in regular attendance at the public schools. The small percentage of attendance is accounted for by the sparseness of population in rural districts. Nearly half the inhabitants of the island are collected in towns, the rest being so scattered over the country as to give a density of only 18 per square mile. Bad roads, the terrible heat, and the poverty of the people cut down the attendance. The organization of "school cities" was one remarkable feature introduced during the year. The plan is to have the scholars organize themselves into bodies similar to the municipal governing bodies, the purpose being to teach the youth the first principles of responsibility and self-government. The plan has worked with remarkable success and great things are predicted for it in the future.

Commerce.—An interesting table given by the secretary of war in his annual report for 1902 shows by classes of goods the total imports and exports of Cuba for the period of the American occupation from July 18, 1898, to May 20, 1902. From this it appears that the value of all imports was \$225,437,135, of which \$97,790,310, or 43 per cent., came from the United States, while the exports were \$180,609,067, of which \$135,416,140, or 75 per cent., went to the United States. The largest valued imports, in fact, the only classes valued at as much as \$7,000,000, were foodstuffs, \$75,233,450; animals and animal products, \$40,364,743; cotton, silk, vegetable fibres, wool, etc., \$33,736,778; metals and metal manufactures, \$20,765,690; and liquors and beverages, \$10,433,997. Of these classes the United States furnished respectively, 54, 28, 10, 71, and 18 per cent. The value of the considerable exports were: Tobacco and manufactures of tobacco, \$82,997,115; sugar and molasses, \$77,699,641; woods (unmanufactured), \$3,018,967; iron and manganese ore, \$2,658,323; fruits and nuts, \$2,551,220; and all other articles, \$11,683,801. The United States took respectively of these classes, 55, 100, 58, 97, 100, and 47 per cent. The figures show that in the four years the balance of trade against Cuba was \$44,828,068, and that the balance of trade against the United States as regards Cuba, was \$37,625,830. That is, while Cuba was buying in general more than she was selling, she was selling 75 per cent. of her products to the United States and buying from the United States only 45

per cent. of her imports. As frequently pointed out, however, there was no reason why, with a proper reciprocity treaty with Cuba, many articles such as cottons, woollens, wines, chemicals, drugs, vegetables, and vegetable fibres, live stock, and leather goods, should not come almost exclusively from the United States.

The American minister at Havana, Mr. H. G. Squiers, in his official report on the foreign commerce of Cuba notes a decrease of 143,000 tons in the sugar trade for the first six months of 1902, as compared with the same period of 1901, but 318,000 tons were held in storage to await better prices. Nearly all the wheat, flour, corn, crude oil, coal, and meats, except jerked beef, were imported from the United States. Spain and Canada supplied large quantities of potatoes, onions, hams, and butter. Imports from the United States for the first six months of 1902 show a decrease of 12 per cent. from the corresponding period in 1901, while imports from Spain increased 2 per cent.

Agriculture and Industries.—Gen. Fitzhugh Lee in an interview published on July 13, 1902, said that unless financial and industrial conditions should improve soon, anarchy or annexation to the United States would result. Throughout most of the year, the Cuban planters were agitating for annexation. On July 30, their organization, the Circulo Hacendados, held a meeting and voted to carry on a propaganda for annexation. Later in the year industries revived somewhat, and more stability was manifested. The sugar crop of Cuba for 1902 was estimated at 880,000 tons. The total of American investment in Cuban sugar production is probably not far from \$40,000,000. The sugar industry is a business for large investors, but renters or owners of comparatively small properties in the vicinity of large "centrals" or grinding mills, find the production of cane a reasonably profitable occupation under normal market conditions. Many of the mills depend largely upon this source of supply. This is indicated by the fact that during the last season (1902) the number of mills in operation was about 160, while the number of cane growers was estimated at from 18,000 to 20,000.

A good deal of interest was manifested in the experiments toward the culture of tobacco under cheese-cloth as a protection to the plants from the sun and from injury by insects. The duty on cheese-cloth, ranging from 15 to 50 cents per kilogram (2.2046 pounds) was repealed July 30, 1902, in order to encourage this new industry. It is believed that Cuba may rival Sumatra in the production of fine wrappers, for which there is large demand in the United States.

Stockraising and Fruit Growing.—Of the 900,000 caballerias (30,000,000 acres) of land in Cuba, 500,000 caballerias (16,600,000 acres) were uncultivated in 1902, and produced nothing. On these lands at least 4,000,000 head of cattle could be pastured, allowing 8 head per caballeria (33 1-3 acres), which would be a moderate estimate, as the land is well adapted to stock-raising. About 400,000 head of cattle were imported and distributed throughout the island during 1902—the average consumption of the island being 300,000. In several sections, notably in the vicinity of Havana, large tracts were bought in 1902 for the cultivation of oranges, pineapples, and vegetables. The larger plantations have produced fair returns in the past and the industry offers many inducements to those of small means who are willing to back their capital with due intelligence and hard work. On the northeastern coast the United Fruit Company acquired extensive plantations during 1902 for the growing of bananas and other fruits. It is believed that eastern Cuba can grow all the bananas and cocoanuts consumed in our eastern markets.

Mining.—Although many metals and minerals are found in Cuba few mines of any importance have been developed thus far. The iron and manganese mines to the eastward and northward of Santiago are again in operation. The Spanish-American Iron Company at Daiquiri represents an investment of \$3,000,000 of American money. The ore from its mines is used for admixture with American ores. The Juragua iron mines represent another \$1,500,000, but there are signs of exhaustion and consequently shipments of ore were greatly reduced. The Panupo Manganese Mine represents a capital of \$500,000, and the Cuban Manganese Company and the Standard Company represent \$250,000 each. Some 200 other mining claims are located in the same region but they are as yet undeveloped.

Railways.—The existing railways in Cuba are largely owned by British capitalists. During the calendar year of 1902 the total profits of all the operating companies amounted to \$2,120,000. The Havana Electric Railway Company began the reconstruction of the street railway system of Havana. The cost of the improvements was estimated at \$3,000,000, and when these have been completed Havana will have a thoroughly modern street car system with 36 miles of single track. The most important enterprise carried out in 1902 was the completion of the central line of railroad from Santa Clara to Santiago, a distance of 350 miles. The aggregate length of this "backbone railway," as it is aptly termed, with its feeders to the north and south coasts, will be approximately 1000 miles. The branches reach to such ports as Nipe, Baracoa, Gibara, and Manzanillo. For over half a century a sys-

tem of this kind has been talked of by foreign capitalists, but it was not until Sir William Van Horne, the builder of the Canadian Pacific Railroad, formed the Cuban Company, that this great agency for developing the interior resources of the island was provided. The difficulties in construction arose from the inability to secure a governmental franchise. The outright purchase of a private right of way consequently became necessary. For a time a working force of 6000 men was employed, and at certain portions of the route the line was carried forward at considerably more than a mile a day. The tracks are of standard gauge, the bridges of steel and masonry, and the equipment is thoroughly modern.

The telegraph system is a government institution, inherited from Spain, and has been much improved and extended by the Signal Corps of the United States Army.

Land Conditions.—Land titles in the unoccupied and newly settled parts of Cuba are in many cases defective. The government has recently taken steps towards the perfection of titles. There are no obtainable government lands, as practically all land is held by individuals and in the eastern portion of the island it is usually held in large tracts, especially in the vicinity of the new railroad. No systematic land survey has yet been made and the large areas are mostly in irregular forms—their boundaries being mostly defined by watercourses or other natural objects, and roads. In some cases boundaries are doubtful, or entirely undefined.

The Postal Frauds.—On March 24, 1902, the audiencia, or district court of Havana, found E. J. Rathbone, C. F. W. Neely, and Dr. W. H. Reeves, guilty of embezzling post-office funds, and sentenced them to ten years' imprisonment each. In addition Neely was fined \$56,701; Reeves, \$35,516; and Rathbone, \$35,324.

In 1899 Rathbone was director-general of posts in Cuba, Neely chief of the financial bureau, and Reeves chief of the bureau of postal accounts, and later an assistant auditor of the island when his bureau was made a division of the auditor's department. In 1900 charges of embezzlement were preferred against Neely, and Reeves, becoming frightened, turned State's evidence, confessed his own share in the frauds, and implicated Rathbone as well as Neely. It was believed for a long time that Rathbone's worst fault was incompetency, and that he was merely the victim of Neely. Rathbone was neither arrested nor removed. Then Fourth Assistant Postmaster-General Bristow was sent to Cuba to investigate. His report submitted to Secretary of War Root, July 25, 1900, implicated Rathbone in Neely's embezzlements, and charged him with converting to his own use money from the Cuban postal revenues, and of gross neglect of his duties, and recommended his removal. Neely, Reeves, and Rathbone were arrested in the United States as was also E. P. Thompson, postmaster of Havana. Neely resisted extradition, but was beaten after an appeal to the United States Supreme Court. Mr. Bristow in his report fixed the minimum of Neely's embezzlement at \$131,713.89, of which \$101,113.16 was secured by the sale of United States stamps, surcharged for use in Cuba, which were ordered destroyed after the issue of a special series of Cuban stamps. Rathbone was accused by Reeves of complicity with Neely, and in addition it was shown that he made the most extravagant misappropriation of public funds for his personal use, that he drew \$5 a day for expenses after his salary had been raised to \$6500 a year with the understanding that there should be no daily allowances, and that he kept up a princely establishment at the expense of the Cuban taxpayers. The cases were appealed to the Supreme Court of Cuba where the finding of the lower court was sustained. The convicts began serving out their sentences, but after the establishment of the civil government in Cuba the Cuban Congress passed a bill which was signed by President Palma June 9, granting amnesty to all Americans in prison or awaiting trial. Accordingly the three embezzlers were set free.

Executive Officers of the Cuban Government.—The principal executive officers of the Republic of Cuba in 1902 were: President, Tomas Estrada Palma; vice-president, Luis Estevez Romero. Cabinet: Secretary of state and justice, Carlos de Zaldo; secretary of the interior, Luis Yero Buduen; secretary of public instruction, Leopold Cancio; secretary of public works and acting secretary of agriculture, Luciano Diaz; secretary of the treasury, José M. Garcia Montes.

Governors of the Provinces.—Havana, Gen. Emilio Nuñez; Pinar del Rio, Col. Luis Perez; Santiago de Cuba, Gen. Francisco Echavarria; Santa Clara, Gen. José Miguel Gomez; Puerto Principe, Gen. Lope Recio; Matanzas, Col. Domingo Lecuona.

In September Señor Terry, the secretary of agriculture appointed by President Palma, resigned because his plans for the relief of Cuban agriculture were blocked in the Congress by the radical element. He was generally regarded as one of the most energetic and capable members of the cabinet, and his resignation was a great loss to the administration. It was affirmed by some Cuban papers that the political neutrality of President Palma made his position more difficult, as he had not the hearty support of either party. The lack of harmony in the cabinet, however, did not prove serious.

CUMBERLAND PRESBYTERIAN CHURCH was organized in 1810, in the Cumberland Valley of Kentucky and Tennessee. It is strongest in the central, south central, and southwestern States, considerably more than one-half of its adherents being found in the synods of Tennessee, Texas, and Missouri. There are now 16 synods and 118 presbyteries, with 2944 churches with property valued at \$5,025,873, and 184,493 members and 1595 ordained ministers. In the Sabbath-schools are enrolled 111,772 teachers and scholars. In the church year 1902 contributions for all purposes aggregated \$923,660, a gain of more than \$100,000 over the amount of the previous year. The seventy-second annual meeting of the general assembly of the church was held May 15-22, 1902, in Springfield, Mo., Rev. S. M. Templeton was chosen moderator. Reports on the foreign mission fields in China, Japan, and Mexico were made, and on the work at home, that among the Indians being noted as very encouraging. The creation of a board of home missions was discussed, but it was decided to refer the whole matter to a subsequent meeting, in St. Louis, of the Board of Missions and Church Erection, together with the synodical corresponding members, the action of this conference to be announced at the next general assembly. The Cumberland Presbyterian Church controls fourteen educational institutions, with a theological seminary at Lebanon, Tenn. The original charter of Lincoln University has been amended to embrace departments at Lincoln and Decatur, Ill., known as Lincoln College and Decatur College and Industrial School. The name of Lincoln University was changed to the James Millikin University in honor of the benefactor whose gifts to the subordinate institutions amounted to \$275,000, including \$200,000 for the new Decatur College and Industrial School. The two colleges have received for endowment and building purposes a total of \$500,000. The session of the General Assembly in 1903 will be held in Nashville, Tenn. The Cumberland Presbyterian Church was one of the denominations named in the appeal for federation issued by members of the United Brethren in Christ (*q.v.*). Two Illinois presbyteries of the former, however, have framed memorials to the General Assembly, asking that body to submit overtures for union to the Presbyterian Church (North). The Cumberland Presbyterians have an official organ, the *Cumberland Presbyterian*, and maintain a publishing house in Nashville, Tenn.

Cumberland Presbyterian Church, Colored, established in 1869, has about 450 ministers, 400 churches, and a membership approximating 39,000. The annual General Assembly of the church convened in May, 1902, at Newbern, Tenn.

CUMMINGS, AMOS J., an American journalist and politician, died at Baltimore, Md., May 2, 1902. Born at Conkling, Broome County, N. Y., May 15, 1841, he learned the printer's trade in his father's office, and when fifteen years old ran away from home to become a journeyman printer. He took part in William Walker's last "invasion" of Nicaragua in 1857, and during the first years of the Civil War served in the Twenty-sixth New Jersey Infantry, leaving in 1863, through illness, with the rank of sergeant-major. He became an editor of the New York *Weekly Tribune* in 1865, was managing editor of the New York *Sun* from 1869 to 1873, filled the same office for the New York *Express* in 1876, and in 1884 began to edit the *Sun's* weekly edition. The evening edition of the same paper he established in 1887. In 1886 he was elected to Congress as Democratic representative of the sixth New York district, succeeded Samuel S. Cox as representative of the ninth district in 1889, and through successive re-elections held a seat in the national legislature until his death. While in Congress he served on many important committees, was instrumental in obtaining the institution of Labor Day as a legal holiday, and was especially prominent in his advocacy of naval expansion. In 1892 and in 1896 he was a delegate to the Democratic National Convention. A traveling tour through Florida and California found description in a series of letters to the New York *Sun* over the signature of "Ziska."

CUMMINS, ALBERT B., who was elected governor of Iowa in November, 1902, is a native of Pennsylvania, having been born at Carmichaels in that State February 15, 1850. He received an academic education at Waynesburg, Pa., studied law, was admitted to the bar, and removed to Iowa, where he practised his profession at Des Moines. He became prominently identified with Republican politics, became widely known as a political organizer and campaign speaker, and served in various capacities in the State organization, and as a member of the Republican National Committee for Iowa. He was one of the leaders of the movement within the Republican party in the Middle West in favor of a reduction of the tariff, and was instrumental in securing planks declaring for such reduction in the Iowa Republican platforms of 1900 and 1902.

CURAÇAO, a Dutch colony consisting of several small islands lying off the Venezuelan coast, has an area of 403 square miles, of which the island of Curaçao comprises 210. The total population on January 1, 1900, was 51,693. The colony is administered by a governor appointed by the crown and resident at Willemstad, the

chief town and port. For 1901 the estimated revenue was 602,000 guilders, and the expenditure 700,000 guilders, the deficit being supplied by the Netherlands. (The guilder is worth 40.2 cents.) The chief products are corn, beans, pulse, cattle, salt, lime, and woods. The imports of the island of Curaçao in 1899 amounted to 1,922,917 guilders.

CURLING, while it engaged only a relatively small following in the United States, was most enthusiastically played in 1902. What is practically the American championship—the Gordon Medal—was won by the Utica team, February 9, which scored 188 points against 81 by the Thistle rink of New York City. Utica also won the Dawson Cup at Van Cortlandt Park, New York, on February 14, defeating the Empire City rink, 21—10. The Dalrymple Medal, contested annually by teams representing the North and South of Scotland, was won in 1902 by the South, at Van Cortlandt Park, January 12, with a score of 57—50.

CURRENCY REFORM. See **BANKS—BANKING** (paragraph Currency Reform).

CYCLING. The season of 1902 in the United States was notable for the numerous changes made in the records for various distances, by both amateurs and professionals. The national amateur championships, held under the auspices of the National Cycling Association, which controls all racing in this country, were won as follows: Quarter-mile, Billington, 30 1-5 seconds, Hartford, Conn., August 20; third-mile, Hurley, 40 2-5 seconds, Springfield, Mass., August 21; half-mile, Hurley, 1 minute 10 3-5 seconds, New Haven, Conn., August 22; mile, Hurley, 2 minutes 17 1-5 seconds, Springfield, August 21; two miles, Root, 5 minutes 18 3-5 seconds, New Haven, August 22; five miles, Root, 10 minutes, 46 seconds, Hartford, August 20. Hurley and Root tied for first place at 18 points, the ride-off being won, September 8, by Hurley. The amateur middle-distance championship went to Sulkins, at New Haven, August 22, distance 15 miles, time 25 minutes. 44 1-5 seconds. In the professional ranks the Grand Circuit championship was won by Kramer, who throughout the circuit made 128 points, with 18 firsts, 4 seconds, and 1 third. Taylor was second with 57 points—5 firsts, 6 seconds, 1 third and 1 fourth. The different events were won as follows: Quarter-mile, Kramer; third-mile, dead heat, Kramer and Taylor; half-mile, Fenn; mile, Kramer; two miles, Taylor; five miles, Kramer. The professional paced records (competition) from 1 to 20 miles were broken by Nelson, 1 mile, 1 minute 20 seconds, to 20 miles, 27 minutes 18 seconds. From 21 to 25 miles Champion set new figures, and from 26 to 41, Elkes. Nelson also made a mile against time in 1 minute 18 3-5 seconds. In the hour, Elkes made a new record, 41 miles 250 yards, with pace. Smith, an amateur, made new records from 1 to 5 miles, paced, against time, and Sulkins did the same in competition. In the unpaced class, Hurley in competition established new marks for one-quarter mile, 28 2-5 seconds; one-half mile, 57 1-5 seconds; two-third mile, 1 minute 18 seconds; and five miles, 10 minutes 56 seconds; and Linley at ten miles, 21 minutes 23 seconds. The professional six-day race held at Madison Square Garden, New York City, December 8-13, proved to be a remarkably close contest although the best performance did not endanger the record. The leading teams finished as follows: Leander and Floyd Krebs, and Newkirk and Jacobson, each 2477 miles, 3 laps; MacFarland and Maya, Bedell and Bedell, Moran and Stinson, each 2477 miles 2 laps. This was the fourth annual race held under the law requiring men to ride in teams and prohibiting riders from being on the track more than twelve hours a day. The record is 2733 miles 4 laps, made by Miller and Waller in 1899. The championship of the Intercollegiate Bicycle Association was won by Yale at the Vailsburg (N. J.) track, May 31, with 52 points. Pennsylvania was second with 2 points, and Gallaudet third, with 1 point.

CYPRUS, an island in the Eastern Mediterranean nominally a part of the Ottoman Empire but actually a colony of Great Britain. It has an area of 3584 square miles, and a population (1901) of 237,022. The majority of the inhabitants are adherents of the Orthodox Greek Church, but there are over 50,000 Mohammedans in the island. The capital is Nicosia, an inland town, with a population (1901) of 14,752. The government, in accordance with a convention of 1878, is administered by British officials under a high commissioner, who is assisted by an executive and a legislative council, the latter being partially elective. There is an annual tribute of £92,800 payable to the Sultan. The revenue amounted in 1901 to £215,268, and in 1902 to £198,070, and the expenditure to £135,388 and £135,824, most of which was expended on police and public works. The colony receives an annual grant from the British government, which amounted in 1901 to £32,000. The value of the imports increased from £289,874 in 1900 to £364,137 in 1901, and the exports fell off from £338,371 to £311,130 in the same period. The principal products are agricultural, and include grain of various sorts, linseed, wine, olives, cotton, wool, anise-seed, and sponges. Wine was exported in 1901 to the amount of 1,550,620

gallons. There is a system of elementary schools, receiving government aid, and a number of higher schools under denominational control.

CZECHS. See AUSTRIA-HUNGARY (paragraphs on History).

DAHOMY, a colony of France in Africa on the Gulf of Guinea, lying between Togoland on the west and Lagos on the east, forms one of the administrative divisions of French West Africa (*q.v.*). With only 70 miles of coast line it opens up northward into a broad hinterland, making the total area approximately 60,000 square miles. The population is estimated at 1,000,000. The country is within the jurisdiction of the governor-general of French West Africa, but retains its administrative and financial autonomy, its affairs being locally administered by a governor and council at Porto Novo (population, 50,000). Dahomey furnishes proof that it is possible for a French colony to be self-sustaining. Able administration of its finances has increased the receipts from 325,000 francs in 1890 to 2,648,000 francs in 1901 and 3,580,000 in 1902. (The franc is worth 19.3 cents.) The receipts and expenditures are made to balance, without a subvention from the French government, in spite of an extraordinary expenditure of over 800,000 francs incurred on the surveys and road-bed of the projected railway. The imports amounted in 1900 to 15,221,419 francs, and in 1901 to 15,752,650 francs, while the exports, chiefly palm kernels, palm oil, fish, and kola nuts, decreased from 12,755,894 francs to 10,478,916 francs in the same period. The decrease was probably due to the movement of products of the interior into the neighboring English colony of Lagos, in which a railway into the interior has been completed. This decrease will probably continue until the French line is finished. The commerce is largely in the hands of the Germans, who, in 1901, furnished imports valued at 6,616,005 francs, and took exports valued at 4,940,037 francs. The French furnished imports valued at 3,300,907 francs and took exports valued at 4,006,283 francs. This condition of the colonial trade is due no doubt to the fact that French merchants are given no special privileges.

DAIRYING. The present scope of the dairy industry of the United States is shown by statistics issued by the Census Office during 1902, in a special bulletin. According to these returns, which are for the year 1900, over 18,000,000 cows are kept in the United States for the production of milk. These produce annually nearly 8,000,000,000 gallons of milk. One of the most striking features in the history of dairy farming is the transfer of butter and cheese-making from the farm to the factory. This change has been going on during the last half century, which covers the period of associated or cooperative dairying in the United States, and has increased rapidly in the past decade. The census of 1850 showed eight factories, all for cheese, the butter factory or creamery being a later development. The census of 1880 reported 3932 creameries and cheese factories, and of 1890, 4712, although the latter figures were not complete. The last census gave the number as 9242, including the condensed milk factories. These central plants have under their control 2050 skimming stations (connected with the creameries) and 747 other branches. Wisconsin, New York, and Iowa have the greatest number of these factories.

The total amount of butter produced in 1900 was about 1,524,000,000 pounds, fully two-thirds of which was made on farms, while the total cheese production was over 298,000,000 pounds, all but a small fraction made in the factories. The total value of the milk consumed as such for household purposes is estimated at \$277,645,100, and of the cream, \$4,435,444. There were 50 condensed-milk factories in the United States in 1900, which used 421,378,073 pounds of milk and produced 186,921,787 pounds of the condensed product, an increase of nearly 400 per cent. over the returns for 1900. The product was valued at nearly \$12,000,000. The aggregate annual value of the dairy products of the United States is given by the census as \$590,827,154. The consumption of dairy products per capita, aside from the milk consumed as such, is estimated as follows: Butter, 19 pounds; cheese, 3.3 pounds; condensed milk, 2.3 pounds.

The year 1902 was a very prosperous one for the dairy interests as a whole. In the eastern cities the prices for milk were the highest paid in years. In New York milk could hardly be obtained in sufficient quantity to meet the vast and growing demand. In New York markets the range of price for fancy fresh creamery butter during the year was from 19 cents for a few days in August to 33 cents in April—the highest point reached in years. The average for the year was 24¾ cents, over 3 cents higher than in 1901. The Chicago price ranged from 19.2 cents in August to 28.1 cents in December, and averaged 23.8 cents—the highest average by 3 cents for seven years. The demand for butter was unusually large, attributed to the general prosperity of the country and the employment of the people. No foreign outlet was needed for table grades as home markets paid prices much above a parity with England. The exports of both butter and cheese showed a marked falling off during 1902, the aggregate amounting to about \$5,500,000, against nearly \$8,000,000 in 1901.

The most notable event in the dairy trade of 1902 was the attempt to restrict the fraudulent substitution of colored oleomargarine for butter, by the imposition of a high tax. This legislation was consummated after three years of effort by the variously organized dairy interests. Under the new law colored oleomargarine is taxed 10 cents a pound, but when the product is not artificially colored the tax is reduced to one-quarter cent a pound. The tax under the old law was two cents a pound for either colored or uncolored oleomargarine. Renovated or process butter, i.e., inferior butter which has been treated to a renovating process and rereturned, is taxed the same as uncolored oleomargarine, and required to be properly labeled. The passage of this act is not regarded as an unconditional triumph for the dairy industry. It had a temporary effect on the price of creamery butter, but the ultimate result is variously estimated by manufacturers and dealers in butter. The attempt to impart to oleomargarine a natural yellow color by the use of a small quantity of palm oil in its manufacture has been ruled against by the Treasury Department; but means have been found of giving it a natural yellow color by treatment of the oleo oil and cottonseed oil used in making it, and thus evading the law. Oleomargarine colored naturally as yellow as butter is now being put upon the market and as it contains no artificial coloring matter is subject only to the one-quarter cent tax. Only the original package or tub is required to be labeled, and hence it is sold readily for butter. The returns of the Treasury Department give the production of oleomargarine for the year ended June 30, 1902, under the old law, as 126,316,436 pounds. The production of renovated butter for the same period is estimated at 36,000,000 pounds, although the returns for this are not complete.

One of the most interesting dairy investigations during 1902 was that of Jordan at the New York Experiment Station on the source of milk fat, i.e., the constituent of the food from which it is elaborated. It has been assumed by many that the elaboration of milk fat is largely influenced by the protein or nitrogenous material of the food, and by others that the fat in the food is sufficient to account for that produced in the milk, suggesting a possible transfer of the food fat to the milk. This question has an important bearing on the problem of feeding cows so as to maintain them at their maximum production without waste. Jordan found, in an ingenious series of experiments, that marked changes in the protein and the fat of the rations did not produce noticeable changes in the character or composition of the milk. Relatively large quantities of fat were produced which could not be accounted for by either the protein or fat of the food; and the conclusion was reached that, in certain cases at least, the milk fat must have been elaborated from the carbohydrates (the sugars, starch, etc.) of the food. The Vermont Experiment Station has demonstrated the value of apple pomace (refuse from cider mills) as a food for cows. It has been tried for several seasons, and in 1902 an average of 35 pounds a day per cow was fed continuously without any disadvantage whatever. The milk keeps up in yield and quality, and the cows do not suffer in health. The pomace is ensiled like corn silage, and keeps well until April. It can often be had for the hauling, or for a few cents a load; and the indications are that it has practically the same feeding value as corn silage.

Experiments at the Michigan Experiment Station have shown the value of sugar-beet pulp as a feed for cows; and Lindsey at the Massachusetts Station has shown the effect of the oil of feeding-stuffs on the consistency of the resulting butter.

The New Jersey Station has collected data very carefully for five years on the cost of milk production by its herd of about 25 cows, under the intensive system of dairy farming that is followed. Taking account of the expense for feed, labor, interest, and decrease in the value of the herd, the average cost of the milk was 2.38 cents a quart. The cows are now averaging an annual production of over 6500 pounds of milk each, with a fat content of 4.3 per cent. The milk is bottled and sold on a milk route, yielding a handsome profit. Under this system of dairy farming and growing soiling crops, the farm is increasing in fertility, and with the feeds purchased, more fertilizing materials are being returned to the soil in the manure than are being sold off the farm. During the past five years this total gain in fertilizing materials on a farm of about 65 acres is estimated as equivalent to 18½ tons of nitrate of soda, 20½ tons of acid phosphate, and 1¾ tons of muriate of potash.

The poor grade of cows kept by the average farmer continues to be a great drawback to profitable dairy farming. As illustrating this the reports made by some 30 creameries in Missouri show that the average amount paid by them for milk is about \$30 a year per cow. Reports from nearly 1000 creameries in Iowa give about the same income. This income may be doubled by good feeding and management, as has been abundantly proved. Care in selection and breeding and feeding will soon raise the returns even above this. At one creamery in Missouri a number of patrons averaged from \$45 to \$60 per cow; and there are numerous instances of herds well selected and fed which return \$60 to \$75, and even \$100 per cow.

A new method of milking, originated in Denmark and known as the Hegelund

method, has aroused considerable interest. It consists in manipulation of the udder preceding and following the milking proper, resulting in bringing down the last traces of milk, which, like the strippings, are unusually rich in fat. A test of the method by the Wisconsin Experiment Station, extending over four months and including a large number of cows, showed an average gain of over one pound of milk a day per cow, and one-tenth pound of butter fat, even where thorough milking by the ordinary method was practiced before. This it is calculated would mean, in Wisconsin alone, an annual increased yield of 30,000,000 pounds of butter fat, valued at about \$6,000,000; while exhaustive milking would tend to maintain a maximum milk flow throughout the period of lactation and develop the dairy qualities of both the cow and her offspring.

Dairy bacteriology has given us abundant data on the number of bacteria in milk, but very little on the kinds of bacteria present, and this is a most important matter in the inspection of milk for cities and towns. It seems very fortunate, therefore, that a comparatively simple method has been devised by which the principal classes of bacteria present can be easily determined. The method depends upon the use of a specially prepared medium in the plate culture. Marshall, at the Michigan Experiment Station, has reported an extended study of the aeration of milk, which is quite commonly practiced to free the milk from odors and taints. The process is usually combined with cooling, but he shows that it is less effective at low temperatures than at body temperature, and that the milk should be first aerated in a pure atmosphere immediately after milking, and then cooled.

Jensen, in Switzerland, has reported a very extensive study of the cause of rancidity in butter. He finds this to be due, not to the action of air and sunlight, although these may cause butter to spoil by oxidation, but to the decomposition (cleavage) of the fat by certain micro-organisms—bacteria at first, and later two molds working together. These gain access to the butter from the air, through the cream, and through the water used in washing the butter. Exclusion of air and keeping the butter at low temperature retard the progress of rancidity.

H. E. Alvord of the United States Department of Agriculture has obtained a large amount of data as to the water content of American creamery butter, based on examination of samples from 400 creameries. The water was found to vary from 7.2 to 17.62 per cent., the average being 11.78 per cent., which is lower than was generally supposed. Seven-eighths of the samples contained between 10 and 14 per cent. of water. Marked progress has been made in the technical studies on the progress of ripening in cheese; and the advantages of controlling the process by means of cold storage have been tested on a large scale with satisfactory results.

Among the books on dairying that appeared in 1902, the following may be mentioned as of a popular character: *The Creamery Patrons' Handbook*, Chicago, 1902, pp. 325, figs. 110, contains a large number of articles by experts on milk production, breeds of cows, care and handling of milk, and similar topics; *Creameries in Foreign Countries*, a special consular report issued by the Department of State, showing the status of the creamery industry in most of the European countries, opportunities for new enterprises, introduction of American dairy machinery, and other information of interest to manufacturers; *Milk in its Relation to Public Health*, by George M. Kober, a pamphlet of 230 pages, issued as a document (No. 441) of the United States Senate (Fifty-seventh Congress, first session); *Cheese, Butter, and Condensed Milk, Factory Product*, by Henry E. Alvord, Census Bulletin No. 189, pp. 29, a discussion of the development and present scope of the dairy industry, with statistics; *Die Hygiene der Milch*, by W. Steiger, Leipzig, 1902, pp. 244, plates 15, figs. 113.

DALNY, new Russian port on the Liao-tung peninsula. See MANCHURIA.

DALOU, JULES, one of the greatest and most prolific of modern French sculptors, died April 15, 1902, in Paris, where he was born in 1838. He studied in the *Académie des Beaux Arts*, and under Carpeaux and Duret, and made his début in the Salon in 1867. He was obliged to live in England for several years on account of having held a position in the Louvre under the Commune. Among other works produced at this time was "Une Berceuse," which was acquired by the Duke of Westminster. Having returned to France in 1879, he began exhibiting again in the Salon, and won a high place as an exponent of the naturalistic school. When the *Société Nationale de Beaux Arts* opened the opposition salon in 1890, he was one of its chief supporters and was chosen president of the department of sculpture. He designed the statue of Eugène Delacroix which was unveiled in the gardens of the Luxembourg in 1890. Some of his other pieces are "Mirabeau Delivering His Famous Address in the States-General, 1789," generally considered his masterpiece; "Triumph of the Republic;" and "Bacchus Consoling Ariadne." Among the various honors awarded him was the cross of the Legion of Honor, of which he became an officer in 1889.

DALZIEL, GEORGE, an English engraver, died in August, 1902, at Hampstead, England. He was born December 1, 1815, and in 1835 went to London to study wood-engraving under Charles Gray. With his brothers, John and Edward, he practiced his art for over fifty years and produced many fine-art illustrated books. He is remembered especially in connection with the brilliant period of English wood-engraving in the sixties, his engravings after the originals of Millais, Rossetti, Holman Hunt, and Burne-Jones having done much to popularize those artists. Great credit is due him for raising the artistic qualities of wood-engraving to the degree of excellence which it has now attained. Among the finely illustrated books produced by the brothers Dalziel may be mentioned *Poets of the Nineteenth Century*; *Stanton's Shakespeare*, illustrated by Sir John Gilbert; *Dalziel's Arabian Nights*; *Dalziel's Goldsmith*; *Dalziel's Bible Gallery*. He published three volumes of poems and several volumes of short stories.

DAMS. Assuan Dam.—The total cultivated area of Egypt to-day is about 5,000,000 acres. Each year a considerable area does not receive sufficient water for the growth of crops, and over 1,000,000 acres could be brought under cultivation in Lower Egypt if the water supply were adequate. Before much agricultural development can take place, therefore, some change must be brought about in the irrigation system by which a supplemental volume of water will be added to the low discharge

of the Nile. There is an abundance of water each year from the middle of July to the middle of the following April, and a large part of the discharge of the Nile goes to the Mediterranean without being used. From the first of July until the first of December the water carries so much silt in suspension that it is almost out of the question to consider storage until during the winter months.

The Nile furnishes about 93,000,000 acre-feet of water during an average year. It will only require about 27,000,000 acre-feet of water to supply all the land which is now under irrigation, or which can in the future be cultivated. This leaves 66,000,000 acre-feet of water which will still be unused. Reservoir construction has been discussed for many years. Many sites have been surveyed and examined by engineers and technical commissions, and the big dam at Assuan, 700 miles from the Mediterranean, was finally decided upon. A number of other sites were examined, but the granite formation just above the first cataract finally secured the majority vote, and the great dam, whose construction was begun in 1898, was completed July 30, 1902.

After the selection of this site, the engineers had one difficulty after another to overcome. The dam as originally planned by Mr. W. Willcocks was to run from one island to another where the material for the foundation was the best. The dam was to be slightly over 100 feet high and to be supplied with

GENERAL PLAN OF THE NILE DAM.

(The line *a b* shows the location of the dam as built, while the broken lines *i k*, *i h*, *g c*, *e d*, *f b* show the location recommended by Mr. Willcocks.)

sluiceways and gates which would discharge the entire high-water flow of the Nile and enable water to be stored at any time desired. At this time the archæologists filed objections, holding that if the reservoir were constructed with a depth of water of 100 feet at the dam, the island of Philæ two miles above, would be completely submerged. This island contains a number of interesting temples, but none of great antiquity, most of them having been constructed during the Ptolemaic period. A compromise was finally reached. The height of the dam was reduced to store 66 feet of water instead of 100 feet. The island will be submerged during the time when the reservoir is full, but tourists can still see the temples and can visit them by boat. To guard against injury the foundations of the structures were strengthened.

The length of the dam is about 6000 feet. The entire structure rests upon a solid granite foundation. In some of the many channels of the river it was necessary to go 60 feet below the river bed before solid material was found. The dam is, therefore, over 120 feet in height at these places. Outside of this feature, construction presented no special difficulties. The neighboring hills furnished a fine quality of granite in almost unlimited quantities. Light railways were built to the quarries, and the dimension and rubble masonry stone was brought alongside the dam in this way. The Egyptian Railway connects directly with the steamers at Alexandria, and cement was delivered at Challal, within two miles of the dam site. It was transferred from the Egyptian Railway to the local construction road and carried direct to the points

THE DAMMING OF THE NILE—The Great Dam at Assouan. (Upper) South, or Upstream Side of Dam from West Bank. (Lower) Entrance to Lock of Navigation Channel from the South. (Courtesy, *Scientific American*)

where used. The heavy dimension stone, of which the face of the dam is constructed, was lifted by derricks from the cars to the place where the stone was to be put in the dam. The rubble masonry stone and mortar were carried up inclined planes by native workmen, who received about 15 cents a day for their labor. The masons were nearly all Italians. The dimension stone was cut at the quarry and all corners were protected by wooden frames until ready to lay in place in the dam. The dam contains about 1,000,000 cubic yards of masonry. The work on foundations and lower parts of the dam had to be carried on during low water. The numerous channels into which the Nile is divided favored this work, as temporary dams thrown across the channel in which the work was being carried on threw the water into others, enabling the masonry work to be prosecuted with great ease. During each June the dam had to be put in shape for the coming high water, and the entire year's work had to be planned so as to permit the water to run over the structure without doing it injury.

The depth of the water at the dam will be 65.6 feet when the reservoir is full. The roadway running along the top of that portion of the dam containing sluiceways is 16.4 feet wide. A large part of the eastern end of the dam, containing no sluiceways, is narrower and the roadway is reduced to 9.8 feet. The rubble masonry of the body of the dam is laid in 4:1 cement mortar and the down stream slope is faced with squared rubble laid in the same mortar and pointed in 2:1 cement mortar. The upstream slope, being submerged a large part of the year, is faced with squared rubble laid in 2:1 cement mortar and pointed with the same. The batter of the lower slope of the dam is $1\frac{1}{2}$ on 1. Buttresses 334 feet thick and 26 feet wide are located between each set of ten sluiceways, or about 240 feet apart. The buttresses are added to the dam more for the sake of appearance than because they are needed to increase the strength of the wall.

There are 180 sluices, of which 140 are on a low level and 40 are on a high level, to be operated when the reservoir is full or nearly so. The area of the lower sluices is 150 square feet each. The upper sluices have only half so great an area. Fifty of the lower sluices are supplied with ordinary regulating gates furnished with rollers. The remaining 90 gates are of an improved design, recommended by Mr. Willcocks. A number of the lower sluices have cast-iron linings. These were adopted not so much because they were cheaper or because they would differ in permanency from the masonry sluiceways, but because they could be completed during the period between two seasons of high water. The gates are raised by stationary winches, and as a precaution there is a traveling winch that can be propelled to any point along the dam. In addition to this, the dam is supplied with emergency gates, which roll down from above, covering the opening in the sluiceways. A navigation channel has been constructed along the western margin of the river, which will permit small boats to ascend the cataract. It is proposed to close the lower gates about the first of December each year and store water until some time in May. When water is first drawn off it will pass through the high-level sluiceways, the lower gates not being operated until the head has been greatly reduced.

The Assuan reservoir will store practically all of the flood water of the Nile after the first of December and before the high water of the following year. The water of the Nile during August, September, October, and November carries large volumes of silt. On this account the engineers of the dam are afraid to close the gates of the reservoir before December 1. How the storage system is to be extended with profit has not yet been determined.

The dam will cost Egypt about \$9,000,000. Payment is to be made in sixty semi-annual installments of \$382,845 each. This will make the total cost of the dam, including interest, \$22,970,000. In addition to this burden, Egypt has raised \$5,756,600 for improving the canal systems, especially those of Upper Egypt, so that the water supplied by the reservoir may be fully utilized. The dam was originally designed by Mr. W. Willcocks. Mr. Maurice Fitzmaurice was resident engineer-in-chief, and Sir Benjamin Baker was consulting engineer. The work of construction was done by Sir John Aird and Company. The foundation stone was laid February 2, 1899, by the Duke of Connaught. The formal opening, December 10, 1902, took place in the presence of the Duke and Duchess of Connaught, the Khedive, Lord and Lady Cromer, and many officials and other distinguished persons.

The Tabeaud Dam, near Jackson, Cal., one of the highest earth dams ever built, was practically completed at the very close of 1901, but was not ready for service until 1902. The crest of this dam is 120 feet above the rock foundation vertically beneath it, and 123 feet above the intersection of the lower slope of the dam and the natural surface of the ground. The maximum depth of water in the reservoir is 92 feet, and the available storage capacity is some 55,000,000 cubic feet, or over 400,000,000 gallons. The dam is 636 feet long and 20 feet wide on top, and 50 to 100 feet long and 620 feet wide at the base. It was built as a part of the electrical power development of Jackson. A long description of the dam by Mr. Burr Bassell,

engineer-in-charge of construction, is given in *Engineering News* (New York) for July 10, 1902. A résumé of a large number of failures of dams and reservoirs in the United States was given by Mr. William B. Hill, chief engineer of the Croton Aqueduct Commission, New York City, in his presidential address before the American Water Works Association in June, 1902. (*Proceedings*, as above, Elmira, N. Y., 1902.)

DANISH WEST INDIES, three islands of the Virgin group in the West Indies lying east of Porto Rico, constitute a colony of Denmark. Their combined area is 138 square miles and the aggregate population something over 35,000. St. Croix, the largest, has an area of 84 square miles and a population of 19,783; St. Thomas, area of 33 square miles and population 14,389; and St. John, area 21 square miles and population 984. Christianstadt, on St. Croix, is the capital, and Charlotte Amalie, on St. Thomas, the principal port, has one of the finest harbors in the West Indies and a population of 10,000. The inhabitants are largely negroes, speaking a Spanish dialect, but English is spoken in the ports. There is a governor-general appointed by the Danish crown, but otherwise the colony has almost complete self-government, the legislative power being vested in two colonial councils, one for each of the two districts into which the islands are divided, three-fourths of whose members are elected. The budget, which is controlled by the colonial councils, shows an increasing annual deficit which is partly met by subventions from the Danish government. The budget figures for the fiscal year 1900 showed receipts of \$230,385 and expenditures of \$432,901, leaving a deficit of \$182,516. Two-thirds of the colonial revenue is derived from import duties, and there is an export duty of 5 per cent. on sugar. The production of sugar, formerly carried on extensively in St. Croix, has fallen off greatly in the past decade, but sugar is still the staple product of the island, and is the principal export. Rum and molasses are also exported. The trade is largely with the United States, which, in 1902, furnished imports to the value of \$458,071 and received exports \$638,839, both figures considerably under those for 1901. The trade with Denmark, which was once very considerable, has been steadily decreasing for several years, the imports from the mother country having decreased from \$425,000 in 1883 to \$15,812 in 1900, and the exports from the islands to Denmark showing a decrease from \$98,000 to \$23,048 in the same period.

History: The Failure of the Purchase Treaty.—In December, 1901, it was announced that an agreement for the sale of the Danish West Indian Islands to the United States had been concluded at Washington after prolonged negotiations. A treaty providing for the sale of the islands for the sum of \$5,000,000 in gold, with provisions safe-guarding the rights of the inhabitants, was signed at Washington on January 24, 1902, by John Hay, secretary of State, on behalf of the United States, and Constantine Brun, Danish minister at Washington, for Denmark. This treaty was ratified by the United States Senate on February 17 following. On March 19 the Folkething, the lower house of the Danish Rigsdag, voted to ratify the treaty, but on April 9 the Landsting, the upper house, voted to defer action until after a vote had been taken in the islands for or against the sale, by the electors qualified to vote for the colonial council. Without action the time in which ratification of the treaty by the Danish Rigsdag would have expired June 24, 1902, but on May 27, it was announced that King Christian, of Denmark, had granted an extension of time for ratification for one year, or until June 24, 1903. As the treaty was a ministerial measure, the success of the Ministerial party at the elections early in September was accepted as a practical assurance that the ratification would follow at the autumn session of the parliament. Before the matter came to a vote, however, it was evident that opposition to the sale had been gaining strength among the members, although the popular feeling seemed to be still strongly in favor of the ministerial programme of sale. The vote on the treaty was taken on October 22, 1902, and resulted in a failure to ratify by a tie vote of 32 to 32. Two old and infirm members of the opposition were carried into the chamber (Landsting) on litters in order to cast their votes against the sale. Before the vote was taken Premier Deuntzer announced that the only alternative to the sale was a heavy increase in expenditure for the maintenance of the islands, which since 1870 has amounted to considerably over \$2,000,000. The ministry chose to consider the tie vote on the treaty as an insufficient reason for their resignation, and a proposal made by them immediately after the vote was announced, providing for the appointment of a commission to proceed to the islands and report as to what measures would be necessary for improving their economic condition, was agreed to unanimously. It seemed to be considered probable, both at Washington and at Copenhagen, that after the commission had reported as to the practical impossibility of relieving the existing economic depression, or of lightening the increasing expense to Denmark, the parliament would reconsider its action, and ratify the treaty before the expiration of the time limit on June 24, 1903.

The Christmas Bribery Charges.—In the United States House of Representatives on March 27, 1902, James D. Richardson, a representative from Tennessee and

Democratic leader in the House, called for an investigation of certain charges made by a "Captain" Walter Christmas, formerly a diplomatic agent of the Danish government, who had declared that during the negotiations two years or more before, he had been promised a fund of \$500,000 by the Danish foreign office with which to bribe senators, members of Congress, and other influential Americans and American newspapers to favor the purchase of the Danish islands, and that by promising such payments he had been able to secure the cooperation of several men of influence. The committee of inquiry called for by Mr. Richardson's resolution was appointed and found the charges entirely baseless, and on March 31, an explicit statement of denial was made by the Danish government to the effect that Christmas was never its agent in any matter having any relation to the sale of the islands or that any money was ever paid to him in connection therewith.

DARTMOUTH COLLEGE, Hanover, N. H., founded 1769. President, William J. Tucker, D.D., LL.D. The chief development during 1902 was the adoption of the so-called group-system of studies. The work of freshman year is prescribed as heretofore, with some range in the choice of those who enter for the B.S. degree, among the sciences. After freshman year the electives are restricted only by the requirements of a major study, which consists of three hours per week each for two years, to be selected from different groups of studies. The three groups comprise: (1) language and literature; (2) mathematics and natural and physical sciences; (3) history, social sciences, and philosophy. By a recent vote of the trustees the degree of bachelor of letters will not be conferred after June, 1905; but the degree of bachelor of arts will be conferred after courses of study which must include Latin with other requirements, but admits of choice between Greek and French or German. During the academic year 1901-02, the college had an attendance of 789, a faculty of 66, an income of \$175,000, and a library of about 100,000 volumes.

D'ASSISE, Don FRANCISCO, Duke of Cadiz, died at Epinay, France, April 16, 1902. He was born in Aranjuez, Spain, May 13, 1822, the son of the Infante Francisco de Paul and of the Infanta Luisa. In 1846 he married his cousin, Queen Isabella II. of Spain, and was by courtesy proclaimed king, but his participation and influence in public affairs were always very slight. The revolution of 1868, which forced the queen to abdicate two years later, drove the royal family from Spain, and soon afterward a formal separation was announced. Don Francisco passed the last years of his life in seclusion at Epinay.

DAVIDSON, ANDREW BRUCE, a distinguished Scottish Hebrew scholar, died January 26, 1902, at Edinburgh. He was born at Aberdeen in 1840, studied for the ministry, and was appointed professor of Hebrew and Old Testament Exegesis in the New College of the United Free Church of Scotland in 1863, the year of his ordination. He was a member of the Old Testament Revision Committee, and published authoritative contributions to Hebrew literature, including *A Commentary on the Book of Job* (1862); *An Introductory Hebrew Grammar* (1874), which has been widely accepted both in the United States and Great Britain; and *The Epistle to the Hebrews* (1882).

DAVIS, GEORGE WHITEFIELD, attained the rank of major-general in the United States Army in June, 1902, and in September following, was appointed to succeed Gen. Adna R. Chaffee as commander-in-chief of the United States forces in the Philippines. He was born at Thompson, Conn., July 26, 1839, received an academic education and in November, 1861, enlisted in the Eleventh Regiment, Connecticut Volunteer Infantry, rising to the rank of major, and in 1867 received a commission as captain in the Fourteenth United States Infantry. From 1876 to 1885 he was specially detailed as assistant-engineer in charge of the construction of the Washington Monument, and later served as a member of the War Records Board of Publication in the War Department. He became major in the Eleventh Infantry in 1894, lieutenant-colonel of the Fourteenth Infantry in 1898, colonel of the Twenty-third Infantry in 1899, and brigadier-general in 1900. During the war with Spain he was appointed by President McKinley a brigadier-general of volunteers, and placed in command of a division, but the war came to an end before he had had an opportunity of taking part in any fighting. After the war he was made commander of the Department of Pinar del Rio, Cuba, and in May, 1899, was appointed military governor of Porto Rico. Early in 1900 he was sent to the Philippines as inspector-general of the United States forces.

DAVIS, NOAH, former chief-justice of the New York Supreme Court, died in New York City, March 20, 1902. He was born at Haverhill, N. H., September 10, 1818, removed with his parents to Albion, N. Y., in 1825, and after studying law in the Lima (N. Y.) Seminary, was admitted to the bar in 1841. From 1857 to 1868 he was on the Supreme Court bench, but resigned in the latter year, and from 1869 to 1870 served as a Republican member of Congress. Upon President Grant's appointment he was United States District-Attorney for the southern district of New York

from 1870 to 1872, when he returned to the Supreme Court bench, and two years later was made presiding justice. Among the more important trials to come up before him were those of Edward S. Stokes for the murder of "Jim" Fisk, Jr., and of William M. Tweed for corruption. In 1887 he resumed active practice in New York City, after a judicial career marked by broad learning and intellectual strength, and up to the time of his retirement in 1901 was a prominent figure in legal life. In 1867 Judge Davis was a candidate for the United States Senate but was defeated by Roscoe Conkling in a close contest.

DAWSON, chief town of the Canadian district of Yukon (*q.v.*).

DEAN, JOHN WARD, editor of the register of the New England Historical and Genealogical Society, died at Medford, Mass., January 22, 1902. He was born in Wiscasset, Me., March 13, 1815, and from 1875 until his death was librarian of the New England Historical Genealogical Society. He edited the *New England Bibliopolist* (9 vols., 1880-98), and was the author of *Memoir of Nathaniel Ward*; *Memoir of Michael Wigglesworth*; and *Story of the Embarkation of Cromwell and His Friends for New England*.

DEATH-RATE. See **VITAL STATISTICS**.

DE GRAFFENRIED, REESE CALHOUN, Congressman from Texas, died in Washington, D. C., August 28, 1902. He was born in Franklin, Tenn., in 1859, and graduated at the University of Tennessee in 1878 and at the Lebanon Law School in the year following. After a year's legal practice in Chattanooga he removed to Texas, where he became prominent among those connected with the construction of the Texas and Pacific Railroad. He resumed in 1883 the practice of law in Longview, Tex., and for two months served as county attorney. In 1888 he was a presidential elector, was an unsuccessful candidate for Congress in 1890, and from 1897 until his death was the democratic representative for the Third Texas district.

DEHERAIN, PIERRE PAUL, a French agriculturist, died in Paris, December 7, 1902. Born in Paris in 1830, he took courses in the faculty of sciences, receiving the doctor's degree in 1860, and taught first in the Central School of Architecture as professor of chemistry. In 1865 he became professor in the Agricultural School at Grignon. An assistant naturalist after 1872 in the Museum for Education in Paris, in 1880 he was made titular professor of vegetable physiology. In 1877 he was elected to the Academy of Sciences in the division of agriculture. His investigations, especially in problems of nitrification, the loss of nitrogen from the soil, and the value of cover crops as an aid to improvement, are of great interest. His *Annales agronomiques*, founded in 1875, he continued until the time of his death. He published *Chimie et physique horticoles* (1854); *Recherches sur l'emploi agricole des phosphates* (1860); *Cours de chimie agricole* (1872); *Traité de chimie agricole* (1892); *Les engrais les ferments de la terre* (1895). He was decorated by the Legion of Honor in 1875, and made an officer in 1889.

DELAWARE, an eastern State of the United States, has an area of 2,050 square miles. The capital is Dover. The population in 1900 was 184,735; in June, 1902, as estimated by the government actuary, it was 189,000. The populations of the two largest cities in 1900 were: Wilmington, 76,508; New Castle, 3380.

Agriculture.—According to the *Crop Reporter*, nearly all agricultural crops were large in Delaware in 1902. The principal field crop was corn, with an acreage of 187,134 acres and a yield of 5,239,752 bushels valued at \$2,567,478. Wheat with the remarkable acreage for so small a State of 108,660 acres, gave a yield of 16.5 bushels per acre, or a total of 1,792,890 bushels worth \$1,344,668. In the autumn 117,908 acres were sown to wheat for the 1903 crop. Hay was an average crop with 76,373 acres, yielding 83,247 tons, with a value of \$1,201,254. About 16,000 acres of tomatoes were grown. According to the *American Grocer*, 750,670 cases, each containing two dozen cans, were packed—a pack exceeded by only Maryland and Indiana. Six thousand acres of potatoes were grown, the average yield per acre being 79 bushels as against 55 in 1901, and 48 in 1900. The yield of 474,000 bushels was valued at \$241,740. Fruit and garden products were unusually abundant, but no statistics are available for these important crops.

Political.—J. Edward Addicks, leader of the Union Republican faction in the State, who has been attempting to secure an election to the United States Senate since 1888, renewed his efforts during 1902, to obtain control of the State legislature, and thus attain the goal of his ambition. Delaware has not been represented in the upper house of Congress since the expiration of Mr. Kenney's term in 1901. The followers of Addicks in the legislature had offered, in 1901, to allow any representative of the regular or DuPont Republicans to be elected for the short term of the Senate expiring in 1905, if DuPont legislators would join in electing Addicks for the term ending in March, 1907. The Regulars having refused to agree to this scheme, Addicks failed to secure the requisite number of votes, though ballots were taken every day until the legislature adjourned. His chances were not materially improved

by the events of 1902, and he based great expectations upon the results of the fall election. On September 2, the Union Republican State Convention in session at Dover, nominated William M. Byrne United States district-attorney for the district of Delaware for Congressman. The Regular Republicans refused to accept Byrne's nomination, and renominated Congressman Lewis Heisler Ball. Both factions united in the nomination of Paul B. Norman for state auditor and Martin B. Burriss for state treasurer, although both were anti-Addicks men; and the contest centred on the election of congressmen and members of the State legislature. In three districts the Democrats supported the Regular Republican nominees for the legislature. It was alleged that in the lower counties, which are nominally Democratic and have received most attention from Addicks, bribery was more rife than ever, though both parties were culpable. Votes, it was alleged, sold as high as \$60, the average price paid for a negro's vote being \$10. The voter's-assistant law, passed under Addicks's direction, allowing a voter to take a friend with him into the booth, did much to foster corruption. On November 5, Addicks in a letter addressed to the editor of the *Philadelphia Ledger* and printed in that journal, asserted that large numbers of Republicans had voted the straight Democratic ticket, and that in strong Republican districts the Democrats had placed upon the ticket the Republican candidates in order to secure control of the legislature. He predicted that at least twenty-seven Republicans would go into joint caucus and elect two senators. He also declared that there was no power which could induce him to withdraw as a candidate.

Both Byrne and Ball were defeated in the election by Houston, the Democratic nominee, whose plurality over Byrne was 3398. Byrne, who by President Roosevelt's advice, had resigned his office upon accepting his nomination, was now reappointed, to the great dissatisfaction of the Regulars, who regarded this as a recognition on the President's part of the Addicks faction as representing the Republicans of Delaware. President Roosevelt took occasion to defend his course, saying that similar reappointments had been made in other States, and that the one in question was based upon considerations of personal merit and of satisfactory service only. Owing to the disputes in two or more districts, full returns were not published until December 28, when it appeared that on joint ballot there would be 28 Republicans, 7 of whom were known to be opposed to Addicks, 23 Democrats and one tie, this being in the ninth district of Kent County. At a special election December 30, called by Governor Hunn, J. W. Powell, Union Republican received 496 votes, a plurality of 192 over Solomon Sapp, Democrat. This gave Addicks 22 votes on joint ballot, 27 being necessary to a choice. The year 1902 closed with the State unrepresented in the Senate.

Conventions and Platforms.—The Republican State Convention was held on August 19. The platform endorsed the administration of President Roosevelt and called for his nomination in 1904. Regarding trusts the platform said "We favor State and Federal legislation to regulate combinations of capital that unduly enhance the prices of the necessities of life, and we favor the modification of revenue laws that strengthen this combination." The views of the President regarding Cuban reciprocity were approved. The attacks of the Democratic party on the military administration were strongly condemned.

The Democratic State Convention was held at Dover on September 16. The principal plank, apart from the usual declarations of Democratic doctrine, had reference to the existing condition of affairs in the State regarding the election of United States senators. In this connection, the platform says: "We, the delegates of the Democratic voters of the State of Delaware, in State convention assembled, do declare that the question of overwhelming importance to the people of this State is whether the State shall be wholly controlled by its criminal and ignorant classes under the leadership of a commercial adventurer and his creatures, who, disgracing and corrupting our politics as far as they can, only know enough of the traditions of our State to revile them and to attack the memories of those honorable and upright men under whose guidance and advice our State maintained her high position in the Union."

Other Events.—The E. J. du Pont de Nemours Company, with capital of \$20,000,000, was chartered at Dover on February 27, 1902, for the purpose of manufacturing gunpowder and other explosives. It succeeded the powder company of which the late Eugene du Pont was president, and which was founded in 1782. On April 4, the General Electric Company, with a capital of \$1,000,000, pledged to build a road from Woodland Beach to Milford, surrendered its charter and all its rights and privileges to the city of Dover. These were taken over by J. E. Addicks, who purposed to form two companies, of which he would be president, the Milford Construction and the Delaware Electric Railway, the former to build trolley lines in lower Delaware; the latter to operate the system. On August 11 the Harlan and Hollingsworth Shipbuilding Plant at Wilmington was transferred to the United States Shipbuilding Company for the sum of \$1,500,000.

Elections.—At the regular biennial State election held November 4, 1902, the officers voted for were treasurer and auditor. The vote for treasurer was Burris (Rep.), 20,705, and Hossinger (Dem.), 16,652. The State legislature for 1903 will be composed of 10 Republicans and 7 Democrats in the Senate, and 20 Republicans and 14 Democrats in the House.

State Officers.—For 1902 and 1903: Governor, John Hunn (elected for four years, term ending January, 1905); lieutenant-governor, Philip L. Cannon; secretary of state, Caleb R. Layton; treasurer, Martin B. Burris; auditor, P. B. Norman; attorney-general, Herbert H. Ward; commissioner of insurance, George W. Marshall—all Republicans.

Supreme Court: Chancellor, John R. Nicholson; chief justice, Chas. B. Lore; associate justices, Ignatius C. Grubb, W. C. Spruance, James Pennewill, and William H. Boyce—all Democrats except Spruance and Pennewill, Republicans.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

DENMARK, a constitutional monarchy of Europe lying to the north of Germany. The capital is Copenhagen.

Area and Population.—The area of Denmark (the peninsula of Jutland and islands in the Baltic) is 14,848 square miles, or with the Faroe Islands 15,360 square miles. The total population, according to the revised figures of the census of February 1, 1901, was 2,464,770, as against 2,185,335 on February 1, 1890. The inhabitants of the Faroe Islands numbered 12,955 at the earlier date and 15,230 at the later. During the eleven-year period the rural population in Denmark proper increased about 4.3 per cent. and the urban 29.7 per cent. Copenhagen had 378,235 inhabitants (with suburbs, 476,806). Emigration, chiefly to the United States, amounted to 2799 in 1899 and 3570 in 1900. The established church is the Lutheran, but religious toleration prevails. Elementary instruction is free and compulsory.

Government.—The executive authority is vested in the king, who is assisted by a ministry of eight members, appointed by him and responsible to the lower house of the parliament. This body, the Rigsdag, consists of the Landsting, or upper house (54 members), and the Folkething, or lower house (114 members). Members of the Landsting, which in general represents the landed and conservative interests, are in part appointed by the crown, and in part chosen by certain electoral bodies; members of the Folkething are elected by popular vote. The sovereign in 1902 was Christian IX., who was born in 1818 and ascended the throne in 1863. The heir-apparent was his son, Prince Frederick, born in 1843. On July 23, 1901, Prof. J. U. Deuntzer, of the University of Copenhagen, formed a ministry (state council), representing the Left, to succeed the Conservative ministry of M. Hannibal de Sehested. This ministry, which continued during 1902, was as follows: Premier and minister for foreign affairs, Professor Deuntzer; minister of the interior, Enevold Sørensen; justice, P. A. Alberti; finance, Christopher F. Hage; war, Col. W. H. O. Madsen; marine, Rear-Admiral F. H. Jöhnke; public instruction and worship, J. C. Christensen; agriculture, M. Ole Hansen; public works, M. Hörup, who had perhaps unequalled influence in the Radical party. He died February 16, 1900. His portfolio was taken over by M. Hage.

Army and Navy.—All able-bodied men on reaching the age of twenty-two years are liable to military service. The peace strength of the army in 1901 was 824 officers and 8945 men; war strength, 1448 officers and 60,134 men. The navy comprises 5 coast-defence armor-clads, 6 third-class cruisers, 7 gunboats, 34 torpedo boats, a turret ship, a barbette ship, and a torpedo ship.

Finance.—The monetary standard is gold and the unit of value the krone, worth 268 cents. Revenue and expenditure in kroner for fiscal years ending March 31, have been: 1899, 71,193,060 and 76,259,212 respectively; 1900, 72,561,487 and 77,500,052; 1901, 78,859,357 and 78,883,529. The estimated revenue and expenditure for the fiscal year 1903 were 69,445,585 kroner and 74,911,809 kroner respectively; for 1904, 70,200,000 and 74,500,000 respectively. The largest items of revenue in the former budget were indirect taxes (mainly customs and excise), 51,405,630 kroner, and direct taxes, 10,886,300 kroner. The largest items of expenditure were for the reduction of the public debt and the improvement of state property, 13,693,359 kroner; the army, 10,775,338; service of the debt, 8,126,509; public instruction and worship, 7,039,457; the navy, 6,875,514; ministry of the interior, 6,075,809; of justice, 5,012,453. On March 31, 1901, the total public debt amounted to 217,294,224 kroner, of which 149,012,250 kroner constituted the foreign debt.

Industries, Commerce, etc.—The principal industries are agriculture and dairy-farming. The leading products include beets, oats, and other cereals, potatoes, and butter and other animal produce. In 1899 the general imports and exports were valued at 492,079,000 kroner and 364,521,000 kroner respectively; in 1900, 526,803,000

and 393,570,000 respectively. The special commerce (that is, imports for consumption and exports of Danish production or manufacture) has been in kroner as follows:

	1898	1899	1900	1901
Imports	367,328,000	399,768,000	416,174,000	397,210,000
Exports.....	238,525,000	270,129,000	281,915,000	292,000,000

The values in kroner of the leading imports in 1900 were: Cereals, 66,873,000; textile manufactures, 58,372,000; coal, 47,362,000; metals and hardware, 47,081,000. The most important exports of home produce were butter, pork, eggs, and lard, which aggregated a value of 197,627,000 kroner; in 1900 there was also an importation of these commodities amounting to 52,037,000 kroner. Almost the entire butter export, amounting to over 147,000,000 kroner in 1900, goes to Great Britain. In 1900 the leading countries in the import trade were: Germany, 153,568,000 kroner; Great Britain, 108,093,000; United States, 77,839,000; Norway and Sweden, 60,503,000; Russia, 49,051,000. The most important countries receiving Danish (general) exports in 1900 were: Great Britain, 233,467,000 kroner; Germany, 67,765,000; Norway and Sweden, 50,222,000; Russia, 23,010,000; United States, 6,909,000.

In 1901 there were open to traffic 1810 miles of railway, of which 1108 miles were owned by the state. The total cost of the state lines up to March 31, 1901, was 247,492,711 kroner.

History.—Government in Denmark under its first ministry of the Left since 1859 has hardly been so fruitful of reform and progress as was hoped. In this ministry, formed July 23, 1901, Professor Deuntzer became premier and minister of foreign affairs, and M. Alberti minister of justice. The portfolio of foreign affairs in Denmark is not of relatively great importance, while that of justice has large powers and influence. So it came about in 1902 that M. Alberti, who, unlike Professor Deuntzer, is ever ready to forward his own cause with vigor, overshadowed and sometimes antagonized the premier. The main business before the Rigsdag in both the spring and the autumn sessions was the consideration of the treaty ceding the islands of St. Thomas, St. Croix, and St. John to the United States. For an account of this see DANISH WEST INDIES. In general further parliamentary action was not of great importance except the measure providing for reforms of the judiciary, under discussion in the autumn session. The spring session revealed the increasing divergence between the Left and the Socialists in the Folkething, while later in the year the Moderate Left party was seriously weakened by the defection of some of its members to the Radicals. The September elections of 1902 changed the Landsting to the following composition: Conservatives, 29; Independent Conservatives, 11; Radicals, 25, and one Socialist. The Folkething continues strongly Liberal. The parliament reconvened October 6, 1902, when the Folkething elected a new president, M. Hermann Trier. In presenting the budget, M. Hage, minister of finance, said there was no prospect of checking the steady increase in expenditure, and that further taxation would be necessary. Aside from the American treaty, mentioned above, the parliament was occupied chiefly with the judiciary reform bill, which at the end of the year seemed assured of enactment. Another proposed law receiving considerable attention provided that civil marriage be obligatory. And at the end of the year an act was passed increasing copyright protection. The former president of the Folkething, Sophus Høgsbro, died January 15, 1902, at the age of eighty years. As already mentioned, M. Hörup, minister of public works, died February 16. On May 25, President Emile Loubet, returning from St. Petersburg, visited the Danish court at Copenhagen, where he was cordially received. Apparently with small warrant this occurrence led to the supposition on the part of some writers that Denmark, whose geographical position commands Russia's outlet to the Atlantic, was to be drawn into the Franco-Russian alliance. It is more likely that Denmark desires a guaranteed neutrality.

In November, 1902, M. Jean A. A. J. Jusserand, French minister to Denmark, was appointed ambassador at Washington. In November the Crown Prince Frederick visited the court at Berlin. This in some quarters was regarded as significant of a change in Denmark's policy, which, since Prussia took Schleswig-Holstein, has been steadily anti-German.

For the colonies of Denmark, see DANISH WEST INDIES, GREENLAND, and ICELAND.

DE VERE, AUBREY THOMAS, an Irish poet, from the death of Tennyson the dean of English verse, died in London, January 21, 1902. Born at Curragh Chase, Ireland, January 10, 1814, he was educated at Trinity College, Dublin, subsequently passed some time at Rydal Mount, and in 1842 published his first volume, *The Waldenses, or the Fall of Rora: A Lyrical Tale*. In the year following, his *Search After Proserpine* brought him into favorable prominence as a maker of graceful

verse. Other poetical works are: *Irish Odes* (1869), *The Legends of St. Patrick* (1872), *Legends of the Saxon Saints* (1879), *St. Peter's Chains* (1888), and the dramas *Alexander the Great* (1874), and *St. Thomas of Canterbury* (1876). His prose includes *Essays Chiefly on Poetry* (1887), *Essays Chiefly Literary and Ethical* (1889), and *Recollections* (1897). From 1851 a Roman Catholic, yet always an aristocrat and Unionist on the Home Rule question, he wrote a number of reconciliatory books on the connection of the Church with Irish politics. A classical student of high attainment, with much of the Greek temper evidenced in his work, he was likewise interested in the Celtic revival of the late nineteenth century. Among his best poems are his sonnets, specimens of which are to be found in many anthologies. At Rydal Mount he came under the inspiration of Wordsworth, of whom he writes interestingly in his essays.

DE WINDT, HARRY, an English traveller and journalist, completed in August, 1902, his overland journey from Paris to New York. He was born in Paris, in April, 1856, and was educated at Magdalene College, Cambridge, after which he went to Sarawak, where he served from 1876 to 1878 with his brother-in-law, Rajah Brooks. In 1887 he undertook his first extended trip, covering the distance from Peking to Calais by land, a feat never before accomplished. In 1889 he rode overland from India, via Persia, to Russia, whence in the next year he proceeded to inspect the prisons of western Siberia, and later visited the mines and exile colonies of eastern Siberia. He next conceived the idea of making the journey overland between New York and Paris, and in 1895 made his first attempt, starting from New York. The attempt ended in disaster, and De Windt almost lost his life in crossing Bering Straits, being rescued by a whaler. In 1897 he explored the Klondike, and in 1900 visited Russia and Finland as special correspondent for the *London Daily Express*. In the latter part of 1901, in the interest of the same paper, he started on a second attempt to make the journey from Paris to New York, and after an adventurous journey of 248 days successfully accomplished it, going the entire distance overland, except so much of it as took him across Bering Sea. He has written many accounts of his travels, among which are *On the Equator* (1882), *From Peking to Calais by Land* (1887), *Siberia As It Is* (1892), *The New Siberia* (1895), *Through the Gold Fields of Alaska* (1898), and *Finland As It Is* (1901).

DE WITT, WILLIAM HEDGES, an American jurist and politician, died at Butte, Mont., January 19, 1902. He was born in New York City, March 16, 1853, graduated at Hamilton College in 1875, and at the Columbia Law School in 1878. Being admitted to the New York bar in 1878 and to the Montana bar in 1879, he practiced at Helena until 1881, when he made Butte his permanent home. He was United States district attorney for Montana from 1883 to 1885, county attorney from 1886 to 1889, and served as justice of the Montana Supreme Court from 1889 to 1896. From 1900 until his death, he was a member of the Republican national committee.

DIPHTHERIA. See ANTITOXIN.

DISCIPLES OF CHRIST, popularly known as Campbellites or Campbellite Baptists, a name derived from that of their early leader. The Christian Church was organized in 1827, the movement which resulted in its establishment—a movement for Christian union on the basis of a pure New Testament church—having originated in Kentucky four years after the opening of the nineteenth century. The denomination has had an extraordinary growth, and the year 1902 proved no exception in its history of progress, a gain of 26,836 members having been made. More than 200 houses of worship were dedicated during the past year, and 250 new congregations were organized. There are now 10,957 churches, with 6477 ministers and 1,207,377 communicants; and 8271 Bible schools having an enrollment of 796,699 officers and teachers and scholars. These statistics represent the United States only, and in addition the Disciples have a constituency of some 50,000 in British America, Australia, Great Britain, and in the foreign missionary fields, where work is conducted in twelve foreign countries. In the United States the church is strongest throughout the Central section. The progress of the missionary work is one of the most noteworthy features of the denomination, this activity now being carried on through four national societies, which raised during 1902 a total of \$464,902. The total contributions of the church aggregated \$6,193,967, including \$624,214 for missionary enterprises and \$254,753 for education and benevolences, the balance being devoted to local church work. State and territorial missionary societies number more than forty, and there are also city and district organizations. The educational interests of the Christian Church are represented by a score of higher institutions, of which two, in Louisville, Ky., and Edwards, Miss., are for colored students. Nearly fifty periodicals, weekly, monthly, and quarterly, are issued, six being published in behalf of missionary work.

The national convention of the Disciples of Christ in 1902, held October 16-23

in Omaha, Neb., was noteworthy as one of the largest missionary rallies in the history of the denomination. The prominence of home and foreign missions was emphasized by the address of the secretary of the Student Volunteer Movement, John L. Mott, on the evangelization of the world. The Rev. H. O. Breeden, president of the American Christian Missionary Society, spoke on the "Gospel for This Age—The Gospel of the Person," as contrasted with the "Gospel of the Church" (Catholicism) and the "Gospel of the Book" (Protestantism). Perhaps the most significant action of the convention was its record in favor of the movement for interdenominational federation, a tendency that has become most marked in the middle West, where a number of State and minor federation organizations have been formed. The secretary of the National Federation Society addressed the meeting, and there was also an address on "Christian Union the Paramount Issue," and the only objection urged against the measure was that it implied recognition of "denominationalism." The session of next year will convene in Detroit, Mich.

DISTRICT OF COLUMBIA, the seat of the government of the United States, coextensive with the city of Washington, was formed March 30, 1791, from the cession of land amounting to 100 square miles, made to the United States by the States of Maryland and Virginia. It formerly comprised two counties, Washington and Alexandria, but the latter was re-ceded to Virginia on July 9, 1846, and in 1874 the county government at Washington was abolished. The gross area of the district is now 69 square miles. The population in 1900 was 278,718; in June, 1902, as estimated by the government actuary, it was 292,000.

Finance.—The total receipts of the District of Columbia during the year ending June 30, 1902, were \$3,735,542.42. Of this amount \$3,594,569.55 were revenues collected by the District, and \$140,972.87 were moneys credited to the District of Columbia by the United States as its share of unexpended appropriations made by Congress. This repayment resulted from the curious fiscal scheme of the District of Columbia by which, in general, one-half of the appropriations made to take effect in the District are payable by the United States government. Of the total actual revenues of the District during the year, \$2,795,996.13 was derived from the tax on realty, \$62,522.16 from penalties on realty, \$63,097.58 from the tax on personality, \$104,512.23 from the tax on railroads, \$240,107.80 from liquor licenses, \$147,644.52 from miscellaneous collections, and \$85,918.72 from miscellaneous licenses. In 1902, as in 1901, the District revenues were inadequate to its expenditures, the deficit being \$2,491,574.05, if reckoning all appropriations for the year as obligations, or an actual shortage of \$1,795,242.46 if considering only those appropriations on account of which advances had been made up to June 30, 1902, by the United States treasurer. The total bonded indebtedness of the District on June 30, 1902, was \$14,196,550.

Education.—The public schools of Washington, D. C., have long been celebrated for their excellent system and service. Particular stress is laid upon manual training. In 1902 there were 47,431 pupils enrolled in the schools, and 1283 teachers. There were 133 buildings, and the value of all public property used for school purposes was \$4,352,531. The amount received for school purposes was \$1,525,711, and the amount expended was \$1,485,695.

The commission of architects and landscape gardeners, appointed in 1901 to make plans for the beautifying of the city of Washington, completed their plans during 1902, and caused to be made models of the city as it is and as it will be, and placed them on exhibition at the Corcoran Art Gallery, Washington. The plans for improvement are most comprehensive, and when carried out will make Washington the most beautiful capital city in the world. The experts having the architectural project in hand are Daniel H. Burnham, of Chicago; Frederick Law Olmsted, Jr., of Brookline, Mass.; Charles F. McKim and Augustus Saint Gaudens, both of New York.

The inadequacy of the White House as an official residence for the chief executive of the nation has long been recognized, and plans have been made at different times to remodel or to tear down the old structure and substitute for it a more elegant and commodious mansion. It is generally agreed that the old White House is unfit either for the official or the private residence of the President, but the people are loath to demolish it. During the summer of 1902, elaborate repairs were made on the White House, and a new structure was built to serve as the executive offices. While the repairs were in progress the official residence was removed to a private house in Washington. While these changes improved matters somewhat, it will be necessary to build a new executive mansion before long in order to carry out the plan for the reconstruction of Washington, and to provide a suitable residence for the President.

Government.—The present form of government for the District of Columbia was instituted in 1878, when Congress invested the administration of the District in a board of three commissioners, appointed by the President of the United States,

two of whom must be citizens of the District having a three years' residence therein, and the third must be an officer from the engineer corps of the United States army, with a rank not below captain. The citizens of the District of Columbia have no vote; for all subordinate municipal officers are appointed by the commissioners. The present commissioners are H. B. F. Macfarland (Rep.), president, whose term will expire May 2, 1903; John W. Ross (Dem.), whose term will expire May 5, 1903; and Major John Biddle (non-partisan), U. S. A., detailed during the pleasure of the President of the United States.

Supreme Court in 1902 and 1903: Chief Justice, Edward A. Bingham; associate justices, Alexander B. Hagner, Andrew C. Bradley (died May 15, 1902, and Ashley M. Gould appointed in his place), Harry M. Clabaugh, Job Barnard, and Thomas H. Anderson.

DONKIN, BRYAN, an English engineer, died March 4, 1902, at Brussels. He was born in 1835, and was educated at University College, London, and the *École Centrale des Arts et Metiers* in Paris. After some years spent as an apprentice, he engaged in the construction of heavy machinery, often going to the continent and the colonies to supervise its erection. In addition to his interest in practical engineering, he carried on investigations and research dealing with heat engines from a scientific point of view. He was the author of *Gas, Oil and Air Engines*, a standard work which has passed through three editions; *Heat Efficiency of Steam Boilers*; and of numerous contributions to the engineering press and the journals of the Institutes of Civil and Mechanical Engineers. He was the recipient of the Telford gold medal from the Institute of Civil Engineers, and served as a juror at the Paris Exposition of 1900. He was a vice-president of the British Institution of Mechanical Engineers and a member of many European and American engineering and scientific organizations.

DOUGLAS, GEORGE, the pseudonym of George Douglas Brown (*q.v.*).

DOUKHOBORS, the "spirit-wrestlers," are a Russian sect whose members in Canada attracted widespread attention in 1902 owing to one of the most remarkable religious pilgrimages of modern times. Founded in south-central Russia, about the middle of the eighteenth century, the sect suffered severely at the hands of the government, but finally gained permission to emigrate from Transcaucasia, whither they had been banished years before. A colony went to Cyprus in 1898, and in 1899 a large party arrived in Canada, where they were settled in the Northwest Territories by the Dominion government, which granted them lands and the customary assistance to new settlers. There are seventy-three communities, including some 7000 or 8000 persons, in Saskatchewan and Assiniboia. The Doukhobors, sometimes called Russian Quakers, lead a life of puritan simplicity and are noted for their thrifty and cleanly habits, and for their moral and physical development. They are successful farmers, and as laborers are in demand. A high percentage of illiteracy, however, prevails among them, only 4 or 5 per cent. being able to read or write. The settlements are conducted on the communal system of the Russian *mir*.

In several of the forty villages of the Yorkton district of East Assiniboia originated the so-called fanaticism of the Doukhobors, which affected only a fourth or at most a third of the people of this section, and which was thoroughly disapproved by the Doukhobors of Saskatchewan. The Doukhobors are in serious need of competent leaders. Their chief men were exiled to Siberia some years ago, before emigration, and the women, who are said to be more intelligent than the men, may not serve in authority. A number of the Doukhobors, who generally are vegetarians, were induced by one or two irresponsible preachers to believe that they were called of God to renounce the use of animal products as both food and clothing, as well as the labor of beasts, and to start on a pilgrimage to find Jesus, whose second advent was announced. They set free their horses and cattle, which were herded and sold at auction by the government agent, the proceeds being set aside for the benefit of the former owners, who, however, were not made destitute by their action. The communities possess well filled granaries and storehouses, and in several of the villages from which the cattle were driven, flouring mills are being built. The Doukhobors never have received government aid beyond the original small loans that were faithfully repaid with interest, for the people bear a reputation for honesty and integrity. Late in October, 1902, leaving behind their material wealth, ill-clad to endure the oncoming winter and many without any protection whatever for the feet, these religious fanatics, 2000 strong, set out on their singular march. At Yorkton the women and children were detained; some 500 men continued toward Winnipeg in the province of Manitoba, but were intercepted on November 9 at Minnedosa and, sullenly struggling for release, yet virtually observing their doctrine

of non-resistance, were placed on trains to be returned to their homes. This outbreak of "religious hysteria," noteworthy particularly for its mysticism, is paralleled only in the pilgrimages of the Middle Ages.

DRAMA. By a familiar anomaly the most noteworthy events on the American stage during 1902 were the appearances of European actors and the performance of plays written by European dramatists. Without exception, the work of American playwrights in that year was mediocre and ephemeral; and, with few exceptions, the achievements of American players were equally insignificant. On the other hand, from England came Mrs. Patrick Campbell, for the first time; Martin Harvey, for the first time as a star; Charles Hawtrey, to repeat through the country his success of 1901 in New York, and E. S. Willard, in a more or less familiar repertory; while from the continent Eleonora Duse returned after six years, and Ferdinand Bonn, Adolf Sonnenthal, and Hélène Odilon from the German theatres, acted to the German-American public of New York and various western cities. Of noteworthy English plays Mr. Pinero's *Iris* and Mr. Esmond's *Imprudence* were performed for the first time in the United States. Of the French plays, Julia Marlowe acted for a few weeks in a few cities *Queen Fiametta*, a romantic and poetic tragedy of the Renaissance in Italy, by Catulle Mendès while a bowdlerized version of a farce, *The Two Schools*, by Alfred Capus, made known to us for the first time a conspicuous and promising Parisian playwright of the younger generation. From Germany came English versions of Fulda's romantic comedy in verse, *The Twin Sisters*, acted for a few weeks in New York by the company of the Empire Theatre; of Meyer Foerster's pictorial and sentimental comedy, *Old Heidelberg*; of Sudermann's play of contemporary life, *The Joy of Living*; and Heyse's scriptural drama, *Mary of Magdala*. From Italy Duse brought Gabriele d'Annunzio's three tragedies, *La Gioconda*, *La Città Morta* (*The Dead City*), and *Francesca da Rimini*. From Spain, Mrs. Campbell took a much abridged version of Echegaray's *Mariana*, and from Belgium Maeterlinck's *Pélléas and Mélisande*. To her likewise we owe the performance of the Scandinavian Björnson's *Beyond Human Power*.

In the autumn of 1902 Eleonora Duse returned to the United States for the first time since 1896, giving fifty performances in a few cities of the East, that were significant for the change in her repertory and acting. Hitherto Duse had appeared in America chiefly in the plays of Sardou, the younger Dumas, Sudermann, and Goldoni. In Europe, until 1900, her repertory was virtually the same. Then she began to add to it the Italian tragedies of d'Annunzio, and in the United States she practically confined herself to these. She esteemed them dramas of poetic beauty of form, high and warm imagination, keen and truthful insight into certain phases of life and character, and poignant dramatic effect. She accounted them far fitter vehicles for her art than the plays of Sardou and Dumas. She regarded d'Annunzio as a great poet and great dramatist, a glory of modern Italy, and she chose to act his plays in something of the spirit with which the earlier partisans of Wagner pursued their propaganda in behalf of his music-dramas. In the main, however, they were received here with indifference or positive dislike. Heard in a little known language, the formal beauty of d'Annunzio's poetic prose and verse, their warmth of imagination and ardor of feeling, their felicity of phrase and picture, whether of place, or mood, or character, the poetic glamor that pervaded them made little impression upon American audiences. They heard in them only a flux of strange words, long pictorial speeches of a kind alien to the English-speaking stage, and infinite hair-splittings. They resented d'Annunzio's preoccupation with the aspects, details, and imaginings of sensuous feelings and sensual passion. They were indifferent to the truth and insight of his depiction of inherently morbid temperaments in morbid situations, however vividly imagined. They resented his effort in *The Dead City* to revive incest as a motive of tragedy, and they disliked the placing of *Francesca da Rimini* in the rude, bloody, and ferocious Italy of the mediæval despots rather than in a quasi-legendary nowhere. In fine, they found in the three tragedies an excess of the Latin qualities that are most distasteful to the northern races, and a lively discussion ensued in the newspapers and elsewhere, in which "morbidity," "eroticism" and "degeneracy" played large part. In the main, too, American audiences cared little for the new aspects of Duse's acting that these tragedies revealed.

Of the three, *Gioconda*, a drama of contemporary life, cast in poetic prose, portrays the struggle of a wife of pure and lofty beauty of mind and spirit to repossess the soul of her husband, a sculptor, with all the infirmities and perversities of the artistic temperament, torn between passion for another woman who incarnates the highest achievements and aspirations of his art and intermittent realization of the finer and exalted appeal of the wife's nature. It contains passages of acute, if perverted, insight into the temperaments thus put in play; a scene of notable power in which the two women face each other and lay bare their aspirations in the sculp-

tor's studio; and another that perversely mingles lyric beauty, piercing pathos, and morbid dwelling upon physical mutilation.

The second, *The Dead City*, likewise cast in poetic prose, seeks to unite ancient and modern motives of tragedy and ancient and modern environment. An archæologist and his sister, a poet and his blind wife are shut in a house near the excavations at Mycenæ. The archæologist seeks the bodies of the Atridæ in their tombs, the poet to write of their fate. The fetid atmosphere of the tombs and the legend permeates the atmosphere of the tragedy. The archæologist conceives an incestuous passion for his sister, with which he struggles piteously. The poet pursues her likewise, but gives his desires rein. The girl is gentle, simple, pure, and tortured. Around the three hovers the blind woman, at first dimly suspecting, finally fully realizing, morbidly conscious of her blindness, full of a gentle and high, if perverted, altruism that persuades her that she must sacrifice herself for her husband and the girl, overflowing with compassion, weighted with a growing sense of impending catastrophe. The mingling of ancient and modern motives in the tragedy is not altogether felicitous or artistically defensible. A repulsive atmosphere clothes the play. The poet is a mere replica of the sensually preoccupied heroes of d'Annunzio's novels. On the other hand, the blind woman is imagined with singular beauty and poetic feeling, and the sense of hovering doom hangs over one or two scenes with pervading intensity. A long passage of remarkable vividness describes the finding of the bodies of the Atridæ; and the final scene in which the two men sit over the body of the drowned girl and the blind woman stumbles upon them, is surcharged with tragic power.

The third of the plays, *Francesca da Rimini*, sets forth anew the fates of Francesca, Paolo, and Lanciotto, adds a third Malatesta, an evil youth, whose vindictiveness brings about the final tragedy, and seeks to wrap the action in the atmosphere of the Italy of the Guelfs and the Ghibellines. The piece is relatively free from the traits that English-speaking people find objectionable in d'Annunzio, and, in comparison with the other two plays it is full of action. It abounds in passages of poetic beauty and dramatic poignancy; its passion sounds vital and true; its personages live as human beings, not perverted imaginings; and its pictures of the Italy of the despots are varied and vivid.

In *Gioconda* Duse played the wife; in *The Dead City*, the blind woman; in *Francesca*, the heroine. To all three she brought the subtle and penetrating analytic power which has enabled her to search the mind and heart of every personage that she has mirrored, and to conceive the play of them in each situation the dramatist has contrived. To all three she brought the corresponding synthetic power that has enabled her to fuse and reveal the results of that analysis in an impersonation that carries the illusion of life itself. Now, however, in the new parts this synthesis has become simpler and weightier. She has eliminated details and passed over subtleties that she may dwell with the more emphasis upon the essentials of the personages that she is revealing and may impart a deeper force to the crucial moments of the action. In all three parts she sought, besides a poetic beauty of outline and color, a measure and reserve, an elevation, remoteness, spiritual significance, and purity of feeling new in her acting.

Appearing in America for the first time, in Chicago, on December 30, 1901, Mrs. Patrick Campbell acted throughout the country during 1902. After a long apprenticeship in melodrama in the British provinces, her success as Mrs. Tanqueray and Mrs. Ebb-smith in Pinero's dramas, her association with Forbes-Robertson in Shakespeare's and other plays and her rising reputation in the portrayal of neurotic heroines of the ultra-modern sort had prepared the way for her coming and awakened the interest that attended her tour. In America she acted the parts of Paula Tanqueray and Agnes Ebb-smith, Magda in Sudermann's *Heimat* and Beata in his *Joy of Living*, Mélisande in Maeterlinck's *Pelléas and Mélisande*, Clara Sang in Björnson's *Beyond Human Power*, Mariana in Echegaray's Spanish play, and Jeannie in *Aunt Jeannie*, a trivial comedy of contemporary London manners in the light French conversational fashion by the novelist E. F. Benson.

The distinctive qualities of her acting have been her psychological insight into the moods and traits and the springs of character and action in general of the neurotic heroines of a few ultra-modern dramatists and her capacity for vivid and telling suggestion in the imparting of them. This insight she manifested most fully in her Agnes Ebb-smith, in penetrating and luminous understanding of the content of the part, subtle shadings of interpretation, felicities of detail and contrast and an adroit proportioning of climax and of the whole impression. The same insight was notable in her Magda and in her Beata, which also revealed her command of irony and of a brilliant restlessness which sorted well with these two heroines and which passed into genuine gayety and unaffected lightness of mood in Aunt Jeannie. Her Magda showed also a temperamental skill in the denotement of vague yet deep yearning for affection and sympathy that had its fullest manifesta-

LEADING ACTRESSES—(Left) Mrs. Fiske (*Photo by Sarony.*) (Right) Signora Eleanora Duse (*Photo by Dupont.*)

tion in her wistful, fragile, remote, and artificially simple Mélisande. Such power as she has was most impressive in her poignant conveyance of the fruitless struggles, wan weariness, and despairing misery that settles over Paula Tanqueray in the last two acts of Pinero's drama. Her adroitness and force of suggestion, while conspicuous in all her parts, ranged most widely, subtly and vividly in her Clara Sang, where outstretched in bed through a long act she suggested by felicitous significance of tone, gesture and play of feature, the passing moods and deeper feelings of the sick woman. For acting that depends on subtlety, poignant detail, flexibility, and repressed intensity of feeling, Mrs. Campbell's technical resources proved ample; while her unique insight into certain types of women has commanded intellectual respect.

Two of Mrs. Campbell's plays, acted for the first time in America, proved noteworthy in themselves, Bjornson's *Beyond Human Power* and Sudermann's *Joy of Living*. The former set forth with a kind of bleak dispassionateness, with simplicity, sincerity, and truth, with an absence of theatric device and effect that made its dramatic potency the higher, the faith of a Christ-like pastor of a little Norwegian village in his power to heal by prayer his bedridden wife; the seeming working of the miracle; the wonder of the villagers; the awe of the doubters; the questionings of obtuse pastors; the appearance of the wife walking as one transfigured, only to die in her husband's arms. In Sudermann's play the heroine has carried her right to live according to the fulfillment of her own nature and happiness to the extent of infidelity that long since has become a close and soothing friendship with the whilom lover. Belated discovery comes when his zest for life is keenest, his opportunity fullest. The husband insists that he sacrifice himself to the German code of honor. The wife by poison gives her life instead, half in devotion, half in retributory expiation. The action passes in the aristocratic society of Berlin in our day, and Sudermann overlays the protagonists with political types and political intrigues. The psychology hovers between the right to untrammelled freedom according to Nietzsche, the impulse to retribution and expiation, and obligation to accepted social standards. The characterization is significant, the construction adroit and theatrically effective.

From Germany, likewise, came Paul Heyse's *Mary of Magdala*, which Mrs. Fiske first acted in November, 1902. Without bringing Christ upon the stage and with diligent effort at reverential treatment throughout, the play is saturated with His presence, His teachings, and the events of His life. Touched by them Mary Magdalen is transformed from the proud and restless courtesan into the devout disciple. Judas appears as the discarded lover of Mary conspiring under temptation and in sinister vindictiveness against the Savior. A young Roman patrician would spare His life for Mary's love. The end is the darkness and storm of the crucifixion and the promise of salvation that it carries. With all its affectation of spiritual elevation, Heyse's play follows the lines of the romantic drama of the middle of the last century. So far, however, as it has been tested in America, the public has accepted the piece as without offense to religious feeling. The vivid illusion of its pictures of Jewish life, and the notable acting of Mrs. Fiske as Mary, and of Tyrone Power as Judas have heightened the impression and note of the play.

Of English plays, Mr. Pinero's *Iris* and Mr. Esmond's *Imprudence* were acted in 1902 for the first time in America—the one by Virginia Harned in September, the other by a company of which William Faversham and Fay Davis were the chief members. *Iris* pictures the gradual decay of a weak, sensuous, shallow woman who cannot forswear luxury and seeks it, heedless of the price she must pay, until the youngster that has loved her leaves her to her fate in disgust and the rich Jew that has protected her, now weary and distrustful, casts her into the street. Pinero has made the play with masterly stagecraft, truth of characterization, and bald and sordid realism. It serves, however, no genuinely artistic ends, and the American public, like the English, has held aloof from it. *Imprudence*, on the other hand, is a light and charming comedy, full of wit and shrewd observation, skilfully made, and catching the modern note of sanity and cheerfulness that has been more cultivated by the younger generation of French than of English dramatists. The other work of English playwrights revealed in America in 1902 was ephemeral or insignificant. It comprised Haddon Chambers's *Modern Magdalen*, a theatrical drama sufficiently indicated by its title, which employed the considerable talents of Amelia Bingham's company; adaptations by Sydney Grundy and Edward Rose of Scribe's *Les Doigts de Fée*; a version by Captain Marshall of Scribe's *Bataille des Dames*; a mechanical and unpalatable drama of modern life, *The Mummy and the Hummingbird*, which served John Drew as a vehicle for his familiar talents; the melodrama that Hall Caine drew from his novel, *The Eternal City*, and that Viola Allen acted; and Arthur Lewis's farce, *A Country Mouse*, in which Ethel Barrymore played; and one or two other ephemera. Two English plays, *The Only Way*, and *A Cigarette Maker's Romance*, were the chief vehicles in which Martin Harvey

displayed his peculiar skill and subdued technique in the suggestion of wistful and visionary natures in undeserved distress or sudden elevation.

Of French plays, the much modified version of Alfred Capus's *Les Deux Ecoles* (*The Two Schools*) has already been mentioned. In Paris this play and his *La Veine* established him as the gayest, wittiest, and most adroit writer of French farce of boulevard manners, esoteric Parisian detail, and marital infelicity since Henri Meilhac. In the autumn of 1902 he further fulfilled his promise and established his claim to consideration as a writer of semi-philosophic comedy of manners by *La Châtelaine*, in which he strikes more clearly and seriously his characteristic note of unexaggerated truth to ultra-modern life with its reserves and implications, and of sanity and cheerfulness. Catulle Mendès's *Queen Fiametta*, in the English and bowdlerized version made for Julia Marlowe, lost much of its poetic glamor as a picture of the Italian Renaissance. What was left was a play of clerical intrigue and relentless vindictiveness, of illicit passions and youthful folly. Stripped of much of its emotional appeal it missed fire in America. Two attempts were made in 1902 to transplant fragments of the repertory of the Théâtre Antoine to the American stage. One of the little plays so transferred, *At the Telephone*, failed largely because it did not reproduce the grewsome atmosphere that filled it in Paris as an absent husband listened at the telephone to the struggles and death of his wife at the hands of thieves. The other, *Carrots*, which unfolded with imagination and force the heart and mind of an ill-treated boy, fared better with Ethel Barrymore in the chief part.

The work of American playwrights during 1902 was scanty, with one exception, unworthy of serious consideration. The prolific Mr. Fitch produced three comediettas, *The Stubbornness of Geraldine* for Mary Manning, *The Bird in the Cage*, a remote adaptation from the German, and *The Girl with the Green Eyes* for Clara Bloodgood. All three confirmed his haste, laxity, superficiality, and general indifference to serious achievement. On the other hand the first and third proved anew his dexterous and humorous observation of the outward aspects of acutely contemporary life among prosperous Americans; but in this, as in other respects, there appeared no improvement upon his previous work. Augustus Thomas was unproductive in 1902, except for some share with Richard Harding Davis in a "dramatization" of the latter's *Soldiers of Fortune*, which Robert Edeson acted. The piece and the acting had a flavor of Gibsonic youth and of American humor and notions that carried them to favor; but as a play it was 'prentice work along the lines of conventional melodrama in the new setting of a South American capital. A few plays by minor American playwrights were so indifferent and attracted so little public notice that they scarcely make a part of the record. The vogue of "dramatizations" from popular novels declined, and the few that were made, like that of Miss Mary Johnston's *Audrey* for Eleanor Robson, of Mr. Cable's *Cavalier* for Julia Marlowe, and of Mr. Winston Churchill's *Crisis* for James K. Hackett were of no dramatic consequence.

The exception to all this was a melodrama of the higher sort, *The Darling of the Gods*, by David Belasco and John Luther Long, first acted in November, 1902, and the most noteworthy American play of the year, if not for itself, for the climax it has set to the pictorially opulent mounting of plays by American managers. The action passes in Japan, and scenery, costumes, appointments, the play of light, and the incidental illustration of manners have not yet gone farther with us in richness, variety, solidity, imagination, and the creation, so far as they may, of atmosphere and illusion that are artistically satisfying, even cloying. The play itself, in which Blanche Bates had the chief part, is the drama of the struggle of a remnant of the Samurai against the new order in Japan, personified in a war minister, and the ill-fated love of their chief. It harks back to the Sardou model, especially to his *La Tosca*, but in dramatic substance and theatric effectiveness it ranks far above the other American plays of the year.

American actors during 1902 were content, with three exceptions, to pursue routine. They have revealed no new side of their talents, and the disposition seems to increase among them to stick closely to the sort of part in which each has pleased his audiences. No new actor or actress of promise has risen, and the lack of training in the younger generation grows more evident. Three players, however, ventured Shakespearean revivals, and each was rewarded with much public favor. In the spring Henrietta Crosman, appearing as Rosalind in *As You Like It*, unaided by sumptuous scenery, won praise for pretty if not very imaginative or poetic acting of her part, and so pleased the public that in New York alone the comedy was acted sixty times. In the autumn Richard Mansfield revived *Julius Cæsar*, taking himself the part of Brutus, gathering a competent company and mounting the tragedy with illusive opulence and solidity. Mr. Mansfield's own personation shows no notable insight into Shakespeare's Brutus. It follows the obvious outlines, colors them with his mannerisms, and even gives them a slight ultra-modern and

RICHARD MANSFIELD, as Brutus

neurotic tinge. It had, however, flashes of power and moments of repose and elevation. E. H. Sothern, in turn, repeated his personation of Hamlet, first revealed some years before, and, though it was still deficient on the metaphysical and poetic side, he heightened the qualities that first commended it. Like Mr. Mansfield, he sought a competent performance of the whole play as a play, and in both cases the public flocked to see it.

In the summer of 1902 the Elizabethan Stage Society presented in London the sixteenth century morality, *Everyman*, with some approximation to the original conditions of representation. The piece and the performance made such impression in London that in the autumn the players came to America, acting it usually in ordinary theatres. At first received coldly, it gradually attracted many that seldom visit the theatre and regard plays and acting with distaste.

In London, the theatrical year was chiefly notable for Mr. Tree's mounting of Stephen Phillips's poetic tragedy, *Ulysses*, said to bear closer relation to the spectacular requirements of the contemporary stage than to the Homeric legend, and for the representation of J. M. Barrie's *The Admiral Crichton*, accounted by many the most charming and imaginative English high comedy in a generation. The rest was largely routine. In Paris, aside from the plays of Capus already noted, like conditions prevailed among playwrights and actors, with signs of an increasing tendency in audiences to welcome plays that do not deal with marital infidelity or advocate social theses. On the German stage, Meyer-Foerster's *Alt Heidelberg*, a pictorial and sentimental comedy of German student life, neatly written and depending much on picturesque mounting and racial understanding and sympathy, had an unusual vogue. Hauptmann had another play in his later manner, half symbolic, half realistic, acted in Vienna; and Maeterlinck, forsaking his eeriness and symbolism, wrote a short but moving tragedy of mediæval Italy, *Monna Vanna*.

DRUMMOND, GEORGE, fourteenth Earl of Perth and sixth of Melfort, the eldest peer in England, died at Kew, England, February 28, 1902. He was born in London, May 6, 1807, was educated in France and Scotland, and in 1824 joined the Ninety-third Sutherland Highlanders, in which he soon became captain. At one time he was prevented by attendants from holding the Scottish earldoms of Perth and Melfort, but by a parliamentary act recommended by Queen Victoria, they were restored to him in 1853.

DRYDEN, JOHN FAIRFIELD, was elected United States senator from New Jersey to succeed the late William J. Sewell on January 29, 1902. He was born near Farmington, Me., August 7, 1839, and in boyhood removed with his parents in 1846 to Massachusetts. He prepared for college at Worcester in that State, and entered Yale with the intention of preparing himself for the law. Ill-health interrupted his college course, but he subsequently returned and took his A.B. in 1865. His health, however, did not allow him to carry out his plan of study, but during some years spent in rest and travel he made a special study of life insurance. He planned and, in 1875 organized, at Newark, N. J., the Prudential Insurance Company of America, becoming its first secretary, and in 1881 succeeding to the presidency, a position which he has ever since held. In this capacity he has come to be recognized as one of the greatest authorities on life insurance in the world. He also became one of the founders of the Fidelity Trust Company at Newark, and is largely interested in other financial and industrial corporations and railways. Although always a staunch Republican, until his election to the United States Senate his political activity had been limited to his service in 1896 and 1900 as an elector-at-large on the presidential ticket in New Jersey.

DU BARAIL, FRANÇOIS CHARLES, French general, died in Paris, January 31, 1902. He was born in Versailles, May 28, 1820, entered the cavalry in 1839, and after successive promotions became a brigadier-general in 1863. He participated in the Franco-German war, and after service as commander of the Third Corps of the Army of Versailles was, in May, 1873, called to be minister of war in Marshal MacMahon's first cabinet. A year later he resigned, was given the command of the Ninth Army Corps at Tours, which he held until his retirement in 1887, and acted as president of a commission on cavalry tactics. In 1843 he was made a chevalier of the Legion of Honor, and in 1871 became a grand officer.

DUFFERIN and **AVA**, first Marquis of, **FREDERICK TEMPLE HAMILTON-TEMPLE-BLACKWOOD**, British diplomat and statesman, died at Clondeboyne, Ireland, February 12, 1902. Lord Dufferin's career as a diplomatist was one of the most notable in British history during the last century. Born at Florence, Italy, June 21, 1826, he was educated at Eton and at Christ Church, Oxford, and was appointed a lord-in-waiting to Queen Victoria during part of Lord John Russell's first administration, holding the same honor also in 1854-58. His diplomatic career began with his appointment as attaché of Lord John Russell's special mission to Vienna in 1855,

and he was afterwards almost constantly in the public service up to within a few years of his death. As a peer—he became fifth Baron of Dufferin in 1841, while yet a minor—he was precluded from the active political life of a popular representative, but he held several responsible parliamentary offices. As under-secretary of state for India in 1864-66, under-secretary for war (1866), chancellor of the Duchy of Lancaster and paymaster-general of the forces (1868), he had a varied experience as a member of different Liberal administrations; but interest centres chiefly in his diplomatic and vice-regal positions. In 1860 he was sent to Syria by Lord Palmerston as a special commissioner to investigate the massacre of Christians in that country. With his appointment as governor-general of Canada in 1872, he began a career which embraced the majority of the important offices, outside the cabinet, within the gift of the British crown. Shortly after the expiration of his term as governor-general of Canada (1878), he was sent as ambassador to Russia; from 1881 to 1884 he was ambassador to Turkey, and during that tenure was sent (1882) as special commissioner to Egypt to restore order after the rebellion of Arabi Pasha. In 1884 he became governor-general of India; in 1888, ambassador to Italy; in 1891, ambassador to France, retiring from that post and from active official life in 1896. His service in some of these positions was of exceptional value to the empire. While at Constantinople and at Cairo he was at the centre of complex intrigues by which British interests were seriously threatened; but his astuteness and finesse were sufficient to cope with all the diplomatic resources employed against him. In Canada and in India his popularity and almost ideal qualifications as a viceroy did much to rivet the attachment of widely different populations to the British crown, and during his various ambassadorships he combined a resolute watchfulness of his country's interests with a social tact which made him unusually acceptable. Lord Dufferin in 1888 was made a marquis in recognition of his distinguished services. He was the recipient of academic honors from McGill, Dublin, Harvard, Edinburgh, Oxford, St. Andrew's, and Cambridge universities, as well as the honorary membership of various learned societies. He was an eloquent speaker and graceful writer. The following are among his published works: *Letters from High Latitudes* (1856), *Irish Emigration and the Tenure of Land in Ireland* (1867), *Speeches and Addresses* (1882), *Speeches in India* (1890).

DUNKARDS, TUNKERS, or GERMAN BAPTIST BRETHREN, the last being the incorporated name of the church, though its adherents are becoming known simply as Brethren, a name that probably will be adopted at the next general conference. A sect of plain dress and speech, which came to the United States in the early eighteenth century, having originated in Germany, the German Baptist Brethren believe in a literal obedience to all the commands of the New Testament as essential to salvation. The Dunkards comprise the branches known as Conservative (by far the most numerous), Old Order, Progressive, and Seventh Day (German), the denomination having more than 115,000 members, 3150 ministers, and 1100 churches. It is strongest in the States of Pennsylvania, Indiana, and Maryland. The Brethren Church (Conservative) in this country now includes 2750 ministers and 100,000 communicants, and possesses church property valued at two and one-half million dollars. It maintains an extensive publishing establishment at Elgin, Ill., the periodical issues of which have an aggregate circulation of over 100,000. Under the auspices of the church are seven colleges, with a student enrollment of about 2000. There are foreign missions in Denmark, Sweden, France, Switzerland, India, and Canada, which are conducted through the general mission board, having an endowment of \$500,000. The home missionary work of the denomination is being extended. Missionary work in general is undergoing improvement, and during 1902 additional missionaries were commissioned and the receipts for the work showed an increase over previous years. The annual meeting of the church in 1902, held at Harrisburg, Pa., was largely attended; in 1903 the general conference will convene in Bellefontaine, O., beginning June 2.

DURAND, ALICE MARIE CÉLESTE, a French author, who wrote under the name of "Henri Gréville," died May 26, 1902, in Paris, where she was born October 12, 1842. She was the daughter of a journalist, Jean Fleury, whom she accompanied to Russia in 1856 when he became professor of French literature in the University of St. Petersburg. She married M. Emile Durand, a French professor, and in 1872 returned to France. She had already published stories in the St. Petersburg papers, and now wrote Russian tales for the leading French periodicals, which gained for her great popularity both in France and Russia. Although her stories are of rather a sensational type, she contributed to that interest in Russian civilization which of late years has characterized the French. In 1886 she lectured in the United States on French and Russian literature. She was a very prolific writer, and most of her novels have run into many editions. *Dosia* (1876), and *Sonia*

(1877), which have been reprinted in America, are fairly representative of her work. Other works are: *Dournoy* (1878), *Le Moulin Frappier* (1880), *Rose Rozier* (1882), *Clairfontaine* (1885), *Cléopâtre* (1886), *Le Comte Xavier* (1886), *La Fille de Dosia* (1887), *Nicanor* (1887), *Frankley* (1887), *Comédies de paravent* (1888), *La Seconde Mère* (1888), *L'Avenir d'Aline* (1889), *Chant de Noces* (1889), *La Passé* (1890), *Un Mystère* (1890), *Aurette* (1891), *Péril* (1891), *L'Héritière* (1891).

DUSE, ELEONORA. See **DRAMA.**

DUTCH EAST INDIES, the colonial possessions of the Netherlands lying between the Asiatic continent and Australia and comprising the islands of Java (with Madura, area 50,554 square miles, population (1900) 28,745,698), Sumatra (area 161,612 square miles, population (1897) 3,209,037), Celebes (area 71,470 square miles, population 1,997,860), part of Borneo (area 212,737 square miles, population 1,180,678), and of New Guinea (area 151,789, population 200,000), the Moluccas (area 43,864 square miles, population 399,208), Banca, the Timor archipelago, and a few smaller groups. These figures, of course, are estimates. The total area is 736,400 square miles, and the population approximately 38,000,000, of whom over two-thirds live in the islands of Java and Madura. In 1900 there were about 76,000 Europeans in the islands, and a growing Chinese population of upward of half a million. Batavia, the chief city of Java, has a population of 115,887. The religion is predominantly Mohammedan, the Christians numbering about 375,000. For administrative purposes the islands are divided into two parts, one comprising Java and Madura, where the Dutch control is complete, and the other, the remaining islands, known as the "outposts," in some of which Dutch authority is merely nominal. There is a governor-general for the whole colony, in whom is vested both executive and legislative power, subject to the approval of the home government. There is also a colonial council of five members with advisory and legislative powers. There are two sets of laws in force, one for Europeans based on the laws of the Netherlands, and the other for the natives, formulated with particular reference to their peculiar customs and institutions. The entire colony is divided into residencies, regencies, and districts administered either by Dutch officials or native chiefs. There is a colonial army, mostly native, of 36,000 men, and a navy of 24 vessels, part of which is colonial. The revenue and expenditures in guilders for 1901 amounted to 149,935,934 and 149,885,383, respectively, leaving a surplus of 50,551. The budget for 1902 estimated the revenue at 151,971,414 and the expenditure at 158,149,412 guilders. The guilder is worth 40.2 cents. The revenue is derived chiefly from taxes, monopolies (opium and salt), and the sale of the products of government lands and mines. The principal products are sugar (1,608,718,400 pounds in 1899), coffee (118,044,399 pounds in 1899), cinchona, tobacco, tea, indigo, tin (16,460 tons in the year 1899-1900), coal, salt, gums, bark, and spices. The imports in 1900 were valued at 195,924,000 guilders; and the exports 259,033,000 guilders. Four-fifths of the export trade is with the Netherlands. There are 2226 kilometres of railway in operation, 1914 kilometres being in Java and 312 kilometres in Sumatra. An additional length of 138 kilometres is under construction in Java. See **SUMATRA.**

DUTCH GUIANA, or SURINAM, a colony of the Netherlands on the north-eastern coast of South America, has an estimated area of 40,060 square miles and a population, exclusive of negroes living in the forests, of about 70,000, of whom over 30,000 live at the capital, Paramaribo. The colony is administered by a governor, who with his subordinates, is appointed by the crown. There is an elected legislative body. Religious liberty prevails. For 1900 the revenue was 2,296,000 guilders, besides a subvention of 128,000 guilders granted by the Netherlands to balance the expenditure; for 1901 the revenue was 2,324,000 guilders, and the necessary subvention 381,000 guilders. (The guilder is worth 40.2 cents.) The chief products are sugar, cacao, bananas, coffee, corn, rum, and molasses. Gold mining, placer, and recently quartz, is carried on. The gold export in 1899 was valued at 1,195,151 guilders. In August, 1902, it was officially stated that troops had fired on rioters, who had murdered a plantation manager, killing 13 and injuring 40.

DUTCH REFORMED CHURCH. See **REFORMED CHURCH IN AMERICA (Dutch).**

EARTHQUAKES. An unusual number of earthquake shocks was recorded during the year 1902, and in many instances the shocks were sufficiently violent to cause losses of life and property. The total number of fatalities reported from different parts of the world as due directly to these disturbances cannot be estimated accurately, but it amounted to several thousand. Owing to the terrible cataclysms that devastated the islands of Martinique and St. Vincent, the attention of the public was directed more than usually to the occurrence of volcanic and seismic phenomena.

The earthquakes in 1902 occurred for the most part in the East Indies, central Asia, Asia Minor, southern Europe, West Indies, Central America, and the islands of the South Pacific, these regions falling within a well-marked seismic zone that extends around the earth. The following is a summary of the most notable disturbances that were reported: January 18, Guatemala—Several light shocks doing little damage. April 18, Guatemala—Earthquake of great intensity, generally felt over Guatemala, southern Mexico, Honduras and San Salvador. Its effects were most severe in western Guatemala, where the earth tremors continued for thirty seconds. Fissures were opened in the ground, bridges and railroads were disturbed, and several cities, including Quezaltenango, San Marcos, Tejutla, Tuncanché and Solalá laid in ruins. The loss of life was reported at from 800 to 900. The passage of the earthquake waves was recorded by instruments on the Isle of Wight. The first signs of activity in Mont Pelée, Martinique, were noticed soon after this disturbance. June 14, Sicily—Strong tremors, doing no damage. July 1, Turkey—The city of Salonica was badly shaken, and several lives were lost. July 7, Turkey—An earthquake partially destroyed the town of Zelisova. July 9, Persia—Severe shock felt in the vicinity of Bander Abbas. July 12, Venezuela—Caracas and neighboring towns were badly damaged. Seismic disturbances were frequent in this region throughout the year. August 27, Philippine Islands—Earthquake of marked violence was felt throughout the island of Mindanao; 60 fatalities were reported. September 23, Jamaica—Tremors were noticed at several localities. December 16, Russian Turkistan—The city of Andijan, province of Ferghana, was visited by the severest earthquake disturbance of the year. According to information published in the general press, the shocks were repeated at frequent intervals for a period of several days, but with decreasing violence. The official report issued by the Russian government stated that the total number of lives lost was 4714. Some important contributions to the science of seismology were made during 1902. The University of Tokio and the meteorological department of the Japanese government for several years have been collecting data relative to the character, location, and frequency of earthquake shocks. From a tabulation of the records made at 26 different stations distributed over the empire, it has been found that they may be divided, according to the seasonal frequency, into two groups. In one group the maximum frequency of disturbance occurs during the winter season, and in the other group the maximum frequency falls in summer. Furthermore, when the geographical location of the observing stations is considered, the coincidence is noted, that those stations showing a maximum frequency in winter lie in a district where the larger number of earthquakes originate inland, while those showing a maximum frequency in summer are grouped in a district that is peculiarly liable to earthquakes having a suboceanic origin. An attempt to correlate these results with barometric disturbances brought out some interesting relations between the two factors, from which it may be inferred that an increase in barometric pressure has a marked effect upon land disturbances. A comparison of the daily variations of frequency with atmospheric pressure also leads to the deduction, apparently, that the variation is influenced by corresponding barometric changes. It may be noted in connection with this interesting investigation that Japan, more than any other nation, has encouraged and assisted the study of earthquake phenomena. The University of Tokio is endowed with a professorship in seismology, and more than 1000 recording stations are maintained by the meteorological department. By making use of the data obtained as to earthquake energy, it has been found possible to construct buildings capable of effectually resisting the severe shakings that occur so frequently in Japan.

At the meeting of the Royal Geographical Society of London, held November 11, 1902, Professor J. Milne read a paper containing the results of the most recent investigations of seismic phenomena. Professor Milne divides all earthquakes into two classes—those extending over continental areas or the entire world (macroseismic), and those disturbing limited areas of 200 miles radius or less (microseismic). Large earthquakes are propagated as waves in all directions through the earth and over the surface; they may be recorded with delicate instruments anywhere on the globe. It is believed that they are due to sudden accelerations in the process of rock folding accompanied by displacements of the strata. Such macroseismic disturbances generate two sets of waves of which the first, constituting the preliminary tremors, have periods of 0.1 to 5 seconds and travel during the first 1000 kilometres at a rate of 2 to 2.2 kilometres per second and much faster beyond this limit. The second class of waves, which are much larger in amplitude, have periods varying from 15 to 30 seconds; they reach a place 80° from their origin in about 50 minutes as compared with 15 minutes for the smaller waves. The passage of large waves is sometimes marked by magnetic disturbances at one station, while at another station no magnetic deviation is noticeable, an anomaly that may be due to the varying distances of the stations from the magnetic magma through which

the waves are propagated. There is a close connection between the location of origins of large earthquakes and pronounced irregularities of the earth's crust.

EAST AFRICA, a general term applied to British, German, and Portuguese East Africa (excepting British Somaliland). The area has been estimated at upwards of 1,100,000 square miles and the population at about 15,000,000. See the four articles following and **UGANDA** and **ZANZIBAR**.

EAST AFRICA, BRITISH, a territory extending from the Egyptian Soudan to German East Africa with an estimated area of over 420,000 square miles, comprises the East Africa Protectorate, Uganda Protectorate, and the island protectorate of Zanzibar (*qq.v.*).

EAST AFRICA, GERMAN, a protectorate of Germany on the Indian Ocean between British East Africa and Portuguese East Africa, has an estimated area of 384,000 square miles. The estimated population on June 30, 1901, was 6,172,251; of these 1243 were Europeans (955 Germans), 3420 Indians, and 2648 Arabs. The protectorate is administered by an imperial governor stationed at Dar-es-Salaam and his subordinates in the nine districts. There is a small military force consisting of about 200 Germans and 1700 natives. A decree was issued in November, 1901, providing for the mitigation and ultimate abolition of slavery. For the fiscal year 1903 the estimated revenue (including an imperial contribution of 6,415,200 marks) balanced at 9,601,496 marks. (The mark is worth 23.8 cents.) Various tropical products are raised. The leading exports include rubber, cereals, and coffee. The chief imports are textiles, rice, and other provisions, and iron and steel ware. In 1900 imports and exports were valued at 11,430,540 marks and 4,293,645 marks respectively; in 1901, 9,510,766 and 4,623,471 respectively. In 1902 the commercial prospects of the protectorate showed no signs of improvement. There are only 54 miles of railway in operation, but a considerable mileage is projected. There is little hope, however, of much railway construction in the immediate future, owing to the indifference of the Reichstag. In March, 1902, the Reichstag voted 300,000 marks for the construction of a telegraph from Mpwapwa to Tabora instead of 602,000 marks as proposed by the government. Parliamentary as well as popular criticism upon the imperial colonial policy continued in 1902. In some quarters the opinion was expressed that it is "more than doubtful whether Germany has yet learned the art of rightly administering tropical colonies." And even though the Germans should acquire this art and however valuable East Africa might become to them, some believed that Germany would find it profitable to give over the protectorate to Great Britain in exchange for privileges or territory elsewhere. It was pointed out that the successful termination of the Boer war had emphasized to Great Britain the fact that German East Africa stands in the way of complete British control from Cairo to the Cape. So unsatisfactory is the progress of the country that Dr. Otto Arendt, speaking in March, 1902, said the official report on the protectorate "appeared to have been drawn up by an opponent of colonization."

EAST AFRICA, PORTUGUESE, a colony of Portugal extending from German East Africa southward to Tongaland (British), has an estimated area of 301,000 square miles and an estimated population of 3,120,000. The colony is administered by a royal commissioner and in part by chartered companies. There is a small military force, about two-thirds native. For the fiscal year 1903 the estimated revenue and expenditure were 3,094,698 milreis and 3,127,736 milreis respectively. (The face value of the milreis is \$1.08.) The principal imports are cotton goods, ironware, and alcoholic liquors; the leading exports include rubber, ores, wax, and ivory. Imports and exports in 1900 were valued at 11,036,999 milreis and 6,427,065 milreis respectively, while in addition there was a transit trade amounting to 6,263,867 milreis. The Delagoa Bay Railway is in operation to the Transvaal frontier, 57 miles, and thence extends 290 miles to Pretoria. The Beira line runs from that port for 222 miles to Umtali, on the Mashonaland frontier. For the completion of the Salisbury-Bulawayo Railway (October 6, 1902), connecting the Beira line with the Cape system, see **CAPE-TO-CAIRO RAILWAY**. At the beginning of 1902 there were 1850 miles of telegraph line.

Early in 1902 it was reported that promising gold reefs had been discovered in the province of Lourenço Marques, north of the Momati River and not far from the Transvaal border. A syndicate consisting chiefly of persons in Lourenço Marques was formed to prospect further and work the fields, which, it was reported, the Portuguese government intended to connect by rail with the Delagoa Bay line. Enterprise, however, on a large scale is hardly looked for in Portuguese East Africa. Economic and commercial conditions are retrograde. In the province of Mozambique especially there is noted a progressive decline in the foreign trade. In 1902 the British consul there stated that in order to recover its prosperity the province must gain three things: "capital, the repression of disorders on the mainland, and the thorough and liberal revision of the customs tariff, which at present

weighs heavily on struggling traders." These local conditions, the continued expense of the colony to Portugal, and the importance of the territory to Great Britain in affording easy communication with the Transvaal, as well as with Rhodesia, brought about in 1902 the persistent belief in some quarters that the cession of Portuguese East Africa to Great Britain would not long be deferred. In October rumors were current that a secret treaty existed between Great Britain and Germany relative to a prospective division of the colony; and when questioned in the British House of Commons, Lord Cranborne, the under-secretary for foreign affairs, said that if such a treaty existed he was precluded from giving its terms. The visit of King Carlos of Portugal to King Edward VII. in November, 1902, called forth the suspicion that negotiations were under way for the cession of the colony or at least the province of Lourenço Marques, and this suspicion was not wholly allayed by the statement of the Portuguese minister in London that no negotiations of this kind were pending.

It appears that slave raiding is not yet extinct. In March, 1902, it was reported that the crews of some Portuguese gunboats, landed on the coast of Mozambique, encountered an expedition of slave dealers from Muscat. Of the latter 162 were captured together with 12 dhows, and 50 were killed, while some 700 slaves found chained in the dhows were released.

EAST AFRICA PROTECTORATE, a British dependency bordering the Indian Ocean between the Juba and Umba rivers and extending inland to the Uganda Protectorate, has an estimated area of 280,000 square miles and an estimated population of 2,500,000. The protectorate is administered by a British commissioner, Sir C. N. E. Eliot since 1900, who is also British agent in Zanzibar. The capital is Mombasa (population about 30,000). Revenue and expenditure in the fiscal year 1901 amounted to £64,275 and £193,438 respectively. In the same year imports and exports were valued at £444,142 and £83,959 respectively; in 1902, £421,266 and £113,205 respectively. (The imports do not include railway material and supplies for the administration.) Of the imports in 1902 piece goods formed more than a quarter, and of the exports ivory formed more than one-half, and grain one-fifth. About one-third of the imports came from India, 27 per cent. from Great Britain, 11 per cent. from Germany, and 6 per cent. from the United States. There are severe strictures on the importation of arms, ammunition, and spirits.

Although the so-called Uganda Railway, which is entirely within the East Africa Protectorate, was put in operation from Mombasa to Port Florence, on Victoria Nyanza, 584 miles distant, in December, 1901, a large amount of work remained in 1902 in the construction of bridges and laying the permanent way. The original estimates for the cost of the road proved too small, and in 1902 new appropriations were made by Parliament, not without some adverse comment on the whole enterprise. It seems hardly probable that the line will soon be a financial success; at present it is important to Great Britain chiefly on account of her activity in Uganda. Formerly the journey by the old caravan route from Mombasa to Mengo, the capital of Uganda, occupied seventy days; on the opening of the line to Port Florence the running time was two and a half days, and thence Mengo, 148 miles distant, was reached by steamer in one day.

It is to be regretted that the British government, in pursuance of the promise of 1897, has made no progress toward the abolition of slavery in the coast districts. On April 25, 1895, the provincial court of Mombasa handed down a decision, according to which all slaves imported into the coast territories of the Sultan of Zanzibar (which are leased from him by the British government) since the decree of April 18, 1876, are illegally held and should be confiscated. According to the bishop of Uganda the slaves thus held in the coast territories comprise about nine-tenths of the whole number.

ECONOMIC ASSOCIATION, AMERICAN, organized in 1885; president, Edwin R. A. Seligman, Columbia University; secretary, Frank A. Felter, Cornell University. The annual meeting, with the American Historical Association, was held at Philadelphia, Pa., December 26-29, 1902. The large attendance testifies to the increasing interest manifested throughout the country in economic studies. The first session, according to custom, was a joint meeting of the two associations. It was held in the Drexel Institute and was taken up with the addresses delivered by the respective presidents of the associations. Captain A. T. Mahan spoke on *Subordination in Historical Treatment* and Professor Seligman gave *Economics and Social Progress*, a fitting sequel to his paper *The Materialistic Interpretation of History*, which he read at the 1901 joint meeting at Washington, D. C., and which he has since expanded and published in book form. The underlying thought of the address may be given in the speaker's own words: "Relativity, not absolutism; change, not permanence—is the watchword of all social, political, and ethical progress." Proceeding along his usual line of economic interpretation, Professor Seligman showed that New England democracy and American individualism were

not the result of ancestry, but of certain definite economic conditions. We are now passing from under those conditions and our national character is changing. "While the stubborn racial characteristics must, indeed, not be overlooked, the American of the future will bear but little resemblance to the American of the past. To forecast the coming social transformation in our country without bearing in mind the fundamental change in economic conditions were puerile indeed." There is no occasion for pessimism as to the future. Present day conditions are marked by the practical exhaustion of free land, the predominance of industrial capital, the prevalence of scientific method, and the prevalence of competition.

Saturday morning's session was devoted to the discussion of the State regulation of railways. Charles A. Prouty, of the Interstate Commerce Commission, ably presented the case for a more effective public control. He maintained that railway discriminations instead of decreasing will become extortionate when combination has eliminated all vestiges of competition. It is necessary to establish a commission with power to adjust rates, subject to review and enforcement by a special body created for the purpose. Mr. Walter D. Hines, vice-president of the Louisville and Nashville Railroad, attacked these views vigorously, saying that the Interstate Commerce Commission was neither an expert nor an impartial tribunal, calling attention to the decisions of the courts on rate adjustments made by the commission in proof of his assertion. Saturday afternoon Prof. J. B. Clark, of Columbia University, presented a paper on *The Dynamics of the Wages Question*. The rate of wages tends to conform to the productive power of labor—as the productivity of labor is increased, wages increase, though they may lag behind, so that at no one time do laborers receive what they produce. All influences that tend to raise the standard toward which wages are tending are beneficial to labor. Anything that tends to thrust down the pay of labor or to retard its natural rise is injurious. The latter part of the paper was devoted to an analysis of the effect of monopoly upon the margin between the rising standard rate of wages fixed by the productivity of labor and the actual wages received by labor. Professor Macfarlane read a paper on *Distribution by a Law of Rent*, in which he keenly criticised Professor Clark's position that wages and interest can be reduced to the same differential form as rent.

The morning and afternoon sessions on Monday were given up to the consideration of the problems of organized labor. Mr. Henry White, of the United Garment Workers, presented a paper on *The Union Shop*, which was a calm, forcible argument for the labor union. Mr. Frank K. Foster, of the Massachusetts Federation of Labor, also spoke on trade unionism. The final session on Monday evening was devoted to a discussion of the *Currency Problem in the Orient*. Professor Jeremiah W. Jenks presented the principal paper, which argued for the retention of the present silver standard in the Philippines. Mr. Charles A. Conant and Mr. Horace White took sides against this view. New Orleans was chosen as the meeting place for 1903.

ECUADOR, a South American republic on the Pacific coast, lies between Colombia and Peru. The capital is Quito.

Area, Population, etc.—The estimated area is about 120,000 square miles. There are unsettled boundary disputes with Colombia and Peru. The population is estimated at about 1,400,000, most of whom are Indians and mestizos. The only church having a legal status is the Roman Catholic. To a certain extent provisions are made for free primary instruction, which is nominally compulsory.

Government.—The executive authority is vested in a president, assisted by a cabinet. The legislative power devolves upon a congress of two houses, the Senate and the House of Representatives. The president in 1902 was General Leonidaz Plaza, who as the successful candidate of the Liberal party, was inaugurated on August 31, 1901, for the four-year term.

Finance.—The monetary standard is gold and the unit of value the *sucre*, worth 48.665 cents, or one-tenth of a British sovereign. The chief source of revenue is customs duties and the largest expenditures are for service of the debt, public works, and war. For 1899 the revenue and expenditure amounted to 7,625,830 *sucre*s and 8,897,659 *sucre*s respectively; of the latter sum 6,662,945 *sucre*s were for administrative expenditure. For 1900 the estimated revenue and expenditure were 8,268,100 *sucre*s and 8,967,783 *sucre*s respectively; for 1902, 13,418,504 *sucre*s and 13,319,764 *sucre*s respectively. The foreign debt, held by the Guayaquil and Quito Railway Company, amounted in 1901 to £671,000 (\$3,266,021). The internal debt has been reported at 7,500,000 *sucre*s.

Industries, Commerce, etc.—The principal industry is agriculture and the leading product cacao, which is cultivated in Los Rios, Guayas, El Oro, and other coast provinces. Cacao production in metric tons (2,204.6 pounds) is reported at 26,415 in 1899 and 18,820 in 1900. Official statistics of commerce are published irregularly. According to the Guayaquil chamber of commerce, the imports and exports in

1900 were valued at 13,416,878 sucres and 16,260,413 sucres respectively; in 1901, 15,126,281 sucres and 16,392,333 sucres respectively. In the latter year the United States stood first in the import trade, followed by Great Britain and Germany. The leading imports are cotton and woollen goods, ironware and machinery, and provisions. Cacao amounted to 27,703 metric tons in 1899, 18,826 in 1900, and 23,179 in 1901. In 1901 the leading countries receiving cacao were: France, 10,217 tons; Great Britain, 2697; Spain, 2309; United States, 2270; Germany, 1359. The values of the principal exports in 1901 are stated as follows: Cacao, 12,255,000 sucres; vegetable ivory, 1,618,000; coffee, 649,000; rubber, 571,000; hides, 384,000; straw hats, 380,000. Imports to and exports from Ecuador by countries of greatest importance were respectively in 1901: United States, 3,966,000 sucres and 2,785,000 sucres; Great Britain, 3,575,000 and 2,036,000; Germany, 2,712,000 and 2,143,000; France, 1,996,000 and 6,694,000. Durán (opposite Guayaquil) is connected by rail with Chimbo, about 67 miles distant. From Chimbo a line is under construction to Quito, 219 miles.

History.—In the spring of 1902 investigations were made by the American state department into claims of unjust treatment brought by American railway contractors in Ecuador against the Ecuadorian courts. According to Señor Luis F. Carbo, the Ecuadorian minister at Washington, the cause of the trouble was the repudiation by the railway company of a contract made by its agent for the employment of native labor. Señor Carbo in the name of his government finally gave assurances that the case would be properly adjudicated. The efforts of the United States consul-general at Guayaquil, Mr. Perry M. De Leon, in behalf of the Americans were such that he became *persona non grata* to the Ecuadorian government, and he was succeeded by Mr. Thomas Nast (*q.v.*), who was nominated on May 1.

On the evening of July 16, 1902, a fire broke out in Guayaquil which destroyed about ninety city blocks, including the customs house, railway station, churches, colleges, banks, and numerous dwellings and business houses. There was some loss of life and the estimated property loss was reported at about \$5,000,000.

Favorable comments were made in 1902 upon the administration of the republic under President Plaza.

EDUCATIONAL ASSOCIATION, NATIONAL, organized 1857 and reorganized 1870, includes eighteen departments, covering every important phase of educational work. These are the national council of education, kindergarten, elementary, secondary, higher, normal, superintendence, manual, art, music, business, child study, physical training, science instruction, school administration, library, deaf, blind and feeble minded, and Indian education. The forty-first annual meeting was held at Minneapolis, Minn., July 8-11, 1902. The enrollment for 1902 was 10,350, a slight increase over the attendance at the Detroit meeting in 1901, but the permanent active membership had increased from 2810 to 3215. The officers of the association elected for 1902-03 were: President, Charles W. Eliot, Cambridge, Mass.; secretary, Irwin Shepard, Winona, Minn.; treasurer, W. M. Davidson, Topeka, Kan. Among the important addresses delivered at the meeting were: *Some Pressing Problems*, President Butler, of Columbia; *The Work of the Southern Education Board*, President Alderman, of Tulane; *Devotion to Truth*, Archbishop Ireland; *A Statement of the English Ideals of Education and of England's Debt to America*, Hon. Michael Ernest Sadler; *Education of the American Farmer*, Hon. James Wilson; *Education in the Philippines*, President Schurman, of Cornell; *Educational Conditions and Progress in China*, C. M. L. Sites, secretary of the Educational Association of China. The total receipts of the association for the year ending July 1, 1902, were \$32,266.48, and its expenses \$29,979.34.

EDUCATION IN THE UNITED STATES. Progress in 1902 was along many lines, though the greater interest centred around a few questions and the greater activity in a few lines of work. Among these a leading one has been the movement towards the consolidation of district schools.

Consolidation of the District Schools.—The educational reform movement of the second quarter of the nineteenth century, led by Horace Mann, had for its chief aim the abolition of the control of schools by districts and the substitution of the town or township supervision and management. This reform even in Massachusetts was not made permanent until near the close of the third quarter of the century and so far as it influenced the greater part of the country only resulted in a very superficial supervision of a general character. The district school continued and yet continues to be the typical school of the greater part of the United States. For the past ten years a widespread movement towards the amalgamation of school districts into larger units not only of supervision but of direct administration and tuition, has been going on without attracting the attention of the public. Especially during the year 1902 the public awakened to the significance of this movement and educational authorities throughout the country became alive to its importance and

are being actively enlisted in furthering the tendency. The movement in the time of Horace Mann worked from above downwards: the movement of the present time has sprung up in the localities themselves and is indigenous in many parts of the country. Certainly no more important educational movement exists at the present time, nor one which promises a greater improvement in the efficiency of our public school system. The object of the plan is to consolidate a number of district schools, of small attendance, of meagre equipment and inadequate teaching facilities, into one large graded school employing three or more teachers, better remunerated and hence better prepared for their work. The opportunity for this consolidating movement is to be found in the small enrollment and still smaller attendance of the average country schools. More than 2500 of Iowa's 13,000 schools have an average attendance of less than ten pupils, and 9000 of them an average attendance of less than twenty. More than 50 per cent. of the schools of Indiana have an attendance of less than twenty; more than a thousand schools in Wisconsin an attendance of less than ten. It is not an unknown case for a district school to continue in session for the entire winter with only one pupil. This is a condition not simply in the middle west, but is true of many of the New England States and yet more so of the Southern States. This condition in turn explains the low salaries, and short term of office of the teachers of those schools. Perhaps the most important count in the indictment of inefficiency made against our public school system is that the rate of attendance to enrollment for the whole country is only 68 per cent. The means now being adopted for the betterment of these conditions are the abolition of two-thirds or three-fourths of the district schools in a given town or township, and the conveyance of the children of the entire region to a central school by means of wagons driven by public officials, and supported at public expense. This plan of public conveyance was first provided for by Massachusetts in 1869, but only of recent years has it come into more general favor. The advantages claimed by this system are: (1) teachers better prepared, better paid, and of longer term of service; (2) a larger enrollment of pupils, a larger average attendance, and a far greater punctuality; (3) better classification of pupils with the resulting advantage to both teacher and pupils; (4) better supervision on the part of both local and general authorities; (5) larger classes, with a resulting increase in the interest and enthusiasm of the pupils; (6) a greater interest in school affairs manifested by the community and the opportunity of making the school a centre of the social life of the entire region; (7) improved hygienic conditions, both in respect to the exposure in going to and from school and in the larger, better ventilated and heated school buildings; (8) a lengthened school course, for in most of these consolidated schools a short high school course is added, made possible by the greater number of pupils and teachers and by the better classification; (9) a decreased cost of schooling per capita; if not an absolute decrease, as occurs in most regions, at least a relative decrease, taking into account the improved service and the extended courses of study. In general the plan brings to the rural schools all the advantages now to be found solely in the graded urban schools. Its sociological significance is quite as great as the educational one, for no one thing is doing more towards improving the character of rural living and rendering life under those conditions satisfactory so far as opportunities for bettering the condition of children is concerned. This movement, begun independently in Massachusetts, New York, Ohio, Kansas, Indiana, Michigan, and Iowa, has now spread until it is legally authorized in seventeen States, including, besides the foregoing, Maine, New Hampshire, Vermont, Rhode Island, Connecticut, New Jersey, Pennsylvania, Nebraska, North Dakota, South Dakota, and Florida. The movement has only just begun, and its publicity is of recent growth, but even now in Ohio 23 townships have completely consolidated their schools, with a number more of partial consolidations, while the plan is in partial operation in 44 counties in Indiana and in 28 in Iowa. One of the most noted of these consolidated schools is the one being undertaken under the auspices of the Southern Educational Board in Knox County, Tenn., now the basis of a general industrial school of the type recently found so helpful in the south. The teachers of the summer school of the south, as well as the Southern Educational Board, have officially commended this plan for that region, while the whole subject is receiving most encouraging attention by meetings of superintendents and educators all over the country.

Educational Activity in the South.—No educational movement of 1902 attracted greater attention than that in the Southern States. This movement has been gathering impetus for several years and is now attracting national attention, as it certainly is of national importance. Three things have brought the movement into public notice during the past year: The publication of material based upon the census reports, the work of the Southern Educational Board, and of the General Educational Board, and the first session of the Summer School of the South. The last census revealed the fact that the percentage of illiteracy among the adult male whites of the South is greater now than it was in 1870, and that the percentage of

illiteracy of the total voting population in the ten Southern States was above 16, while that of the whole Union was below 11. The general educational situation in the South that is responsible for this condition is now being clearly set forth. In 1900 the ten States south of the Potomac and the Ohio and east of the Mississippi, including Louisiana, had 22 per cent. of the total population of the United States, and 25 per cent. of the school population; yet only $6\frac{1}{2}$ per cent. of the total expenditures for public schools was made in these States, and only 4.1 per cent. of the \$538,623,736 of public school property was within their borders. The per capita expenditure for public schools varied from 50 cents in Alabama and 51 cents in North Carolina to \$4.93 in Massachusetts and \$5.30 in Nevada. The average for the whole country was \$2.38; for these ten States only 86 cents. The average per capita for these States was less than one-third the average for the whole country and only a little more than one-fifth the average for the North Atlantic and Western States. The average salary paid teachers for the entire school year varied from \$87 for males and \$78 for females in North Carolina to \$1290 for males and \$496 for females in Massachusetts. The average for the whole country, exclusive of these ten States, was \$455.02 for males and \$312.22 for females; for these ten States \$175 for males and \$150 for females. The average number of days of schooling for each child of school age varied from 22 in North Carolina to 107 in Massachusetts. For the North Atlantic States it was 87, for the North Central States 82, for the Western States 80, for these ten Southern States 43. It should be remembered also that only 154,000 of the 5,645,164 children of school age in these ten States were reported as enrolled in private schools, primary and secondary. The total school fund of these ten States was only one million dollars more than the school fund of Ohio, and the total value of their public school property was only one-half the value of the public school property of Ohio.

For some years past a movement of considerable magnitude has been under way, working toward improved educational conditions in these States. During the year 1902 the movement attracted national attention as it centred in the two organizations, the General Educational Board and the Southern Educational Board. The Southern Educational Board has been working for several years under the leadership of its president, Robert C. Ogden, of New York City. Each year a general conference is held in some Southern State which seeks to interest the people of that region and the educators and philanthropists of the entire Union. The work of the board is largely that of educating public opinion and stimulating private interest and philanthropy. The bureau of information of this board, located at the University of Tennessee, has issued four series of publications, one being issued bi-weekly to the press of the South. In this way educational information is distributed to more than 1300 newspapers and journals, to over 600 county and city superintendents of schools, to more than a thousand schools, and to a great number of private parties and public officials. More than a thousand addresses have been delivered under its auspices. The General Educational Board was organized at the beginning of 1902 and offices were opened in New York in April. The application for a charter from Congress brought the organization prominently before the public, with the result of much confusion and misunderstanding. The organization does not propose to supplant a single educational institution or even to found new ones, but to strengthen those in existence. It proposes: (1) To promote education within the United States of America, without distinction of race, sex or creed. (2) To co-operate with other organizations interested in educational work, and to simplify and make effective the general work of education, avoiding unnecessary duplication. (3) To develop the public school system, especially in rural districts. (4) To aid in the maintenance and improvement of educational institutions already established. (5) To further the establishment of training schools for teachers, especially those designed to educate teachers of industrial and manual training. (6) To develop the principle of self-help by urging increased local taxation, local contributions, or by other means. (7) To collect full information and statistics in respect to the educational matters in the districts covered by the operation of the board, which shall be kept at a general office. (8) To furnish the public with information, suggestions and counsel, and for this purpose, to act somewhat as a clearing-house for educational statistics and data to be collected by the board. (9) To educate public opinion in all matters pertaining to the general cause of education by publication of reports through the daily press and by other means. (10) To promote by all suitable means every form of valuable educational work. During the year the board duplicated in a great number of places in the Southern States all the contributions that a town or county would raise to improve the schools and in a similar way all the contributions of friends of existing institutions that had an immediate and beneficial influence on the school system. The aim of both boards is primarily to arouse public interest, to lead to an increased local taxation for schools, to improve the character of the teaching body by providing better opportunities for pedagogical

training. The movement for the consideration of schools finds especial favor in the propaganda and it is especially rural schools that are receiving assistance. The hope is to improve agricultural methods and the general conditions of rural life. Instruction in the schools is to be much more practical and the industrial and manual training, domestic science and instruction in agriculture are to be emphasized. In carrying out one of its purposes the first session of the Summer School of the South was held at the University of Tennessee, at Knoxville, with a registered attendance of over 2000—the largest summer school in the country.

Enlarged Scope of the Work of the School.—The somewhat vague feeling that has existed for a number of years that the school is not doing all that it should in the preparation of children for their adult life, and that the intellectual instruction furnished by the school was only one factor in the education demanded by the future American citizen, has begun to take shape in many practical attempts to broaden the work of the school. Certainly the question itself is one of general interest for educators and its discussion occupied a prominent part in the various educational meetings of the year, notably that of the National Educational Association at Minneapolis. In the larger cities, especially New York and Chicago, where the public school deals with a larger Irish, Polish, and Bohemian population than is to be found in any city in Ireland, Poland, or Bohemia, and where, as in some wards in Chicago, more than forty different nationalities are found, it is essential that educational means other than the traditional ones be called upon to prepare for citizenship. The mere teaching of the English language is not sufficient. The child loses his respect for the more stable and conservative aspects of the civilization of his parents and frequently gets but the superficial trappings of the new; it is essential that he be introduced to as many varied phases of the social life and ideals of the new community as possible. In a similar way the minute specialization of all industries lays upon the school new duties in the way of a broader preparation and a supplementing of the narrow life forced on one through industrial conditions, by broader social activities centred around the school. And even in typical American communities, those of a rural character, if the very source of American vigor and manliness is to be preserved it is seen that the school has the duty of making life under such conditions more attractive, more full of interest and enjoyment and of promoting an education that will bear more directly upon the immediate problems of everyday life. Consequently there are many movements towards increasing the efficiency of the schools in these respects. An official statement on this point by Mayor Low, of New York, gives some of the facts. "The use now being made of school buildings, for other purposes than the regular school work, is interesting. Vacation schools in Manhattan and the Bronx were availed of (*sic*) by 385,496 children; twelve evening play centres, since January 1, by 569,136; roof playgrounds, in Manhattan and the Bronx, by 303,789. Under the authority of the board of education certain outside playgrounds have been conducted, and the following figures show the use made of them. Forty-one playgrounds in Manhattan and the Bronx were used by 725,058 children; twenty in Brooklyn by 569,134; ten open-air playgrounds and six piers by 418,309. In these figures, of course, the same child is counted every time that he was on the grounds. There are also baths in one school building that have been largely used. It is clear, therefore, that the school buildings are beginning to play an important part in the life of the children, aside from their educational function." Some of the school buildings have been opened for Sunday evening concerts under the auspices of various civic clubs. This, however, has met with opposition from some professional denominations. The free evening lectures and concerts are meeting with increased favor. In New York City more than three thousand lectures were given during the past year, with a total attendance of upwards of 900,000. The use for social purposes of the school rooms and gymnasiums by the people of the community at all vacant hours and on Saturday, Sunday, and during the summer vacation, is now being advocated and to a limited extent tried. In this way recreation and means for social intercourse are furnished the people. It is being recognized that schools are for the adults as well as for the children. In one other respect is the school reaching out, and that is by attempting to find and develop special talent among both youth and adult. Such purposes are served by the evening schools, by such institutions as the Cooper Union, and by such experimental schools as the recently established Speyer School of the Teachers College. In a similar way a very general attempt at the introduction into the country schools of elementary instruction in agriculture, in nature study, and of some of the practical and domestic arts, is now being made. This movement is fostered by the State agricultural colleges, by the United States secretary of agriculture, by the Southern Educational Board, and forms one aspect of the movement for consolidation and improvement of rural schools. As above noted, this same movement for consolidation makes for the broadening of the function of the school by making it a social centre as well.

Medical Inspection of Schools.—The spread of disease through the public schools has long been recognized as a menace, but little has been done to control it save by abandoning school sessions in case of epidemics. The past year has seen more systematic and scientific attempts to control this difficulty. During the school year 1900-1901, the New York City school board employed 140 inspectors, who made 47,150 visits to schools and examined 87,980 children of whom 8837 were excluded. The rapid spread of certain diseases, especially cutaneous ones, led to more drastic measures. During the first three weeks of the fall term 34 medical school inspectors were employed for full time with 30 district assistants. During this period 2270 visits to schools were made, 288,324 were examined, and 10,535 were excluded for longer or shorter periods. The larger part of them were excluded for parasitic diseases of the head and contagious diseases of the eye, especially trachoma which eventually produces blindness and is notably prevalent in the foreign quarters, and especially among recent immigrants. Special clinics were established for such children in several hospitals and finally trained nurses are appointed for certain schools to look after the afflicted children. The trained nurse will probably become a permanent attachment to the school administration of the large public schools in such regions.

Measurement of School Results.—The exact estimate of the direct value of any particular portion of school work is one of the most difficult things to obtain. And yet no certain improvement of existing school work can be obtained without some such measurement. The seemingly endless discussions about the curriculum, and about methods would be clarified wonderfully if some exact information of truly scientific character could be obtained. Widespread discussion of the results of the public school system was caused by an address delivered in the autumn of the year by President Eliot, of Harvard, before the Connecticut State Teachers' Association. Existing social conditions, as to labor troubles, crime, illiteracy, the vast amount of worthless reading matter, the character of the press, etc., were cited as partially due to the failure of the public schools to accomplish their purpose. Larger expenditure of money for the public schools was called for to the end that the length of the school term might be increased and the character of teaching improved. But more significant than this public discussion of general results is the movement initiated by Dr. J. M. Rice, of the *Forum*, for the scientific measurement of school results in specific subjects. Most of our educational theories are based upon opinion only and that opinion frequently based upon very narrow experience; yet such theories direct practice, and consequently the greatest variety of method prevails in our schools. Dr. Rice's inquiry is in an attempt to get at absolute results by comparative methods of investigation and the outcome will be awaited with the greatest interest. It is to be regretted that such investigations meet with the opposition of school men, an opposition based largely upon the criticism made some years ago upon the public school system of many cities by Dr. Rice.

Teachers' Organizations.—A somewhat startling development of 1902 was the incorporation of the Teachers' Federation of Chicago in the Chicago Federation of Labor and an effort for a similar union in New York City. Hitherto the many organizations of American teachers have had professional improvement for their sole purpose. The new tendency, however, has for its aim the betterment of economic conditions. Such ends have been achieved in New York of late years without resorting to trade union affiliation though the tendency has been decidedly towards the use of methods similar to those used by other bodies for securing class legislation. In Chicago this radical step was brought about by the continued refusal of the authorities to grant the reasonable demand of the teachers for better salaries. Some time ago a new salary schedule was granted after an organized fight. The authorities refused to honor this schedule on the ground that there were not sufficient funds to meet the new demands. The teachers' organization led in the movement which forced some tax dodging corporations to increase the city funds by over a million dollars, which were soon devoted to other purposes. In addition to this the teachers were deprived of a day's pay for the suspension of work on Labor Day, which is a legal holiday. The upshot of the many injustices was that the teachers sought affiliation with the labor organizations which command political influence to the extent of 200,000 votes. While no doubt now the demand will be granted, the precedent for teachers' organizations in our American cities will be bad, for it will divert such organizations from their more laudable purposes. It is true that the organizations of English teachers is on a trade union basis and that they have similar aims and use similar methods, but the result is seen in a lack of professional spirit and higher purposes.

Books of the Year.—Among the more important books published in 1902 are: *The Making of Citizens; Schools at Home and Abroad*, by R. E. Hughes; *The Making of our Middle Schools*, by Elmer E. Brown; *A Syllabus of the History of Education*, by Elwood P. Cubberley; *Education and the Larger Life*, by E. Hanford

Henderson; *Thoughts on Education*, by Mandel Creighton; *Principles of Teaching*, by J. J. Findlay; *A Schoolmaster's Afterthoughts*, by S. Krine; *Educational Foundations of Trade and Industry*, by Fabian Ware; *The Ideal School*, by F. P. Search; *Teaching of English*, by Percival Chubb.

Statistical Summary of the Year.—The statistics gathered by the department of education are necessarily a year late in their publication, since they are first gathered and collated by local and State authorities. These latest figures therefore relate to the school year of 1900-1901. There were in attendance in schools and colleges, public and private, 17,299,230 pupils, this being an increase of 278,520 over the previous year. Of the number 15,710,391 were enrolled in public institutions. In addition to these numbers, there were 563,550 persons enrolled in schools of special type, such as business schools, schools for defectives, reform schools, and city evening schools. The total enrollment in all educational institutions was

17,862,780. The average length of the school term for the entire United States was 144.2 days; while this is a decrease of .3 of a day from the previous year, it is an increase from 132.2 days in 1870. The average amount of schooling per inhabitant was 5.14 years of 200 school days each. This average varies widely in different regions, being the lowest 2.97 in the States of the South Central division, and the highest 6.94 years in the North Atlantic division. This total is a marked increase for the whole country; in 1870 the average was only 3.36 years; in 1860 it was 434 days; in 1840, 208 days; and in 1800 it was, by estimate, only 86 days. The total number of teachers in the common schools of the United States is 430,004; of these 123,941 are men and 306,063 are women. There has been a marked decline in the relative number of male teachers during the last decade; in 1880, 42.8 per cent. of all teachers were male, while in 1901 only 28.8 per cent. were male. The aggregate value of school property is \$577,000,000, having increased to that amount from \$130,000,000 in 1870. The income from local taxes amounted to \$161,245,764, having increased from \$97,222,426 in 1890. For statistics of the public common schools in the United States, see the table on the preceding page. For statistics of public and private high schools, universities and colleges, normal schools, and professional schools, see SCHOOLS, UNIVERSITIES AND COLLEGES, NORMAL SCHOOLS, and PROFESSIONAL SCHOOLS; for agricultural education, see AGRICULTURE (paragraph Agricultural Education). Many of the more important universities and colleges may be found under their own titles.

Deaths of the Year.—No account of the educational events of 1902 would be complete without some mention of the notable losses to the profession by death. Among these one figure, that of Colonel Francis W. Parker, was of national prominence. Few men have done more during the past half century for the work of the teacher than Colonel Parker, especially through the influences sent out for so many years from the Cook County Normal. Emerson E. White, who at one time was president of Purdue University and later head of the schools of Cincinnati, was another such leader. His influence was exerted more through educational magazines which he edited and through text-books. Both of these men were above all personal leaders and came into immediate contact with large numbers of teachers. Mrs. Alice Freeman Palmer, formerly president of Wellesley College and later dean of women in the University of Chicago, died December 6, 1902.

EDWARD, WILLIAM AUGUSTUS, Prince of Saxe-Weimar and field-marshal in the British army, died in London November 16, 1902. He was the son of Duke Bernard of Saxe-Weimar-Eisenach and of Princess Ida, the daughter of George, Duke of Saxe-Meiningen. Born October 11, 1823, in Bushy Park near London, he entered the British army as ensign in 1841, and was made regimental lieutenant in 1846 with the rank of captain. A marriage in 1851 with Lady Augusta Catherine, daughter of the fifth Duke of Richmond, was declared morganatic, but in 1866 a royal decree granted her the title of princess in Great Britain. Brevetted major in 1854, Prince Edward served in the Crimean war, participating in the battles of Alma, Balaklava, Inkerman, and in the siege of Sebastopol; and in 1869 he became a major-general. From 1870 to 1876 he was in command of the Home District, and after service in the Southern District was made general in 1879. He was in command of the forces in Ireland from 1885 until relieved by Lord Wolseley in 1890, was created a knight of the Grand Cross of the Bath in 1887, became colonel of the First Life-Guards in 1889, and in 1897 was made field-marshal by Queen Victoria.

EGGLESTON, EDWARD, an American author, who died at Owl's Nest, Durham Bay, Lake George, N. Y., September 3, 1902, was most generally known for his *Hoosier Schoolmaster* (1871), a "story of primitive, semi-barbarous life in the Indiana of the early thirties." Born at Vevay, Ind., December 10, 1837, he was successively farm-worker and clerk, in 1857 entered the ministry of the Methodist-Episcopal Church, for some time rode a four-weeks' circuit in southeastern Indiana, and later for nine years a circuit in Minnesota. As journalist he was at Chicago associate editor of the *Little Corporal* (1866-67) and editor-in-chief of the *National Sunday-School Teacher* (1867-70); at New York superintending editor of the *Independent* (1870-72) and editor of *Hearth and Home* (1871-72). From 1874 to 1879 he was pastor in Brooklyn of the Church of Christian Endeavor, an independent organization, whence was derived the name of the well-known religious society founded by F. E. Clark. Having then retired from the ministry, he was until his death wholly occupied with literary work in fiction and history. Though he had previously written *Mr. Blake's Walking Stick* (1870), the *Hoosier Schoolmaster* (1871), originally printed in *Hearth and Home*, was his first success, as it was also one whose vogue he never duplicated. In this book he presents with delicate humor, in all their quaintness of speech, the settler types familiar to his own itinerant experience. The unstudied effect of this volume he did not quite attain in other works of fiction more carefully prepared. Of interest, however, are *The End of the World*

(1872), based on the strange occurrences attending the Adventist enthusiasm in the Middle West, and *The Circuit Rider* (1874). Other titles include *The Faith Doctor* (1891) and *Duffels* (1893). From the apprenticeship of his fiction he passed to a more serious examination of American history, his interests being less in political events than in those developments which form what is known as the history of culture. *The History of the United States and its People* (1888); *The Beginners of a Nation* (1896), and *The Transit of Civilization from England to America* (1900), are his chief publications in this department. These have been highly praised for painstaking research and most readable style, though criticized for a slight lack of appreciation of the Puritan spirit in colonial America.

EGYPT, a state of northeastern Africa nominally under the suzerainty of Turkey, but practically under the protection of Great Britain. The capital is Cairo.

Area and Population.—Though Egypt proper—the territory north of the 22d parallel—has an estimated area of 400,000 square miles, the cultivated and settled area amounts to only about 13,000 square miles. According to the last census (1897) the population was 9,734,405, of whom about 92 per cent. were Mohammedan.

Government and Finance.—The head of the government is the khedive, Abbas Hilmi (since January, 1892). In him and his ministers is vested the final legislative authority. No financial measures, however, can be taken without the concurrence of the British financial adviser (Sir Eldon Gorst, since 1898). Practically "His Majesty's agent and consul-general" (Lord Cromer since 1883) is governor-general of the country. The government pays an annual tribute of about £660,000 to Turkey. The chief sources of revenue are the land tax, the tobacco monopoly, customs, and railways; the largest items of expenditure are service of the debt and internal administration. Revenue and expenditure in Egyptian pounds (worth about \$4.993) have been respectively as follows:

	1899	1900	1901
Revenue.....	£E11,200,908	£E11,447,095	£E11,943,924
Expenditure.....	9,929,442	9,895,224	9,923,546

The figures for revenue are exclusive of balances from previous years. For 1902 the estimated revenue and expenditure were £E11,060,000 and £E10,850,000 respectively. The former figure includes £E215,600 as the contribution from the general reserve fund; in the estimated expenditures are included the following sums: Sinking fund on guaranteed loan, £E65,646; conversion economies fund, £E265,037; and general reserve fund, £E619,038. If Egypt were not hampered by this "peculiar system of accounts and estimates imposed by its international obligations"—as Lord Cromer pointed out—the estimates for 1902 would show £E10,844,000 for revenue and £E9,900,279 for expenditure. At the end of 1901 the balances of the reserve funds (established in 1887) stood as follows: Conversion economies fund (which is available for payments only with the consent of the Powers), £E4,490,500; general reserve fund (which may be applied to certain objects with the consent of the Caisse de la Dette), £E3,794,784; special reserve fund (which is at the disposal of the Egyptian government), £E1,287,352. At the end of 1901 the consolidated debt amounted to £E103,714,180.

Under Lord Cromer's new financial method of freeing the fellaheen from the local usurers, the National Bank of Egypt, between October, 1900, and September, 1901, lent the fellaheen £276,000 payable in part within one year and in part within five years. In the former class there were 13,030 separate advances, of which more than half were for sums less than £5; while in the latter class more than half were for sums less than £20. The percentage of failure in repayment is very small. Thus far this financial innovation seems successful. In May, 1902, it was announced that for furthering this system arrangements had been made for the establishment of an agricultural bank, with a capital of £2,500,000.

Army.—About 18,000 men make up the total strength of the Egyptian army, whose maintenance in 1902 cost nearly £E450,000. The commander-in-chief is a British officer, called the sirdar (Major-General Sir Reginald Wingate, since December, 1899). Under British administration the fellaheen, who were "the most cowardly men that ever carried arms under compulsion" have developed into capable soldiers. The British army of occupation, commanded by Major-General Sir R. A. J. Talbot, numbers about 4500; for its maintenance the Egyptian government appropriates annually £87,000.

Industries and Commerce.—The principal occupation of the people is agriculture, made possible by the Nile overflow. This is now regulated and used to better advantage for purposes of irrigation by a great dam at Assuan and a barrage and lock at Assiut. The last coping stone of the Assuan Dam was laid on July 30, 1902. (See DAMS.) The leading crops are cotton, sugar, and cereals; cotton is becoming

of especial importance. In the foreign trade imports and exports, exclusive of specie, have been as follows:

	1899	1900	1901
Imports.....	£E11,441,802	£E14,112,370	£E15,244,939
Exports.....	15,530,908	16,766,609	15,730,088

In 1901 the leading imports were: Cotton textiles, £E2,414,681; metals and metal wares, £E1,744,084; cereals, vegetables, etc., £E1,706,352; animals and animal food products, £E685,012; tobacco, £E595,621. The most important exports for the same years were: Raw cotton, 6,123,350 cantars (of 99.0492 pounds each), valued at £E11,333,277, as compared with 4,868,596 cantars, valued at £E13,039,003 in 1900; and cereals, vegetables, etc., £E2,649,970. Trade with countries of greatest commercial importance was as follows in 1900 and 1901:

	Imports to Egypt			Exports from Egypt.	
	1900	1901		1900	1901
Great Britain.....	£E5,800,447	£E5,568,498	Great Britain	£E9,141,932	£E8,013,911
Turkey.....	2,220,906	2,246,414	Russia.....	1,209,563	1,743,205

Belgium.....	494,751	498,768	Turkey.....	290,193	312,789
America.....	289,380	315,890	Belgium.....	121,165	83,033

Communications.—At the beginning of 1902 there were 2173 miles of rails, of which 1393 miles were owned by the state and the remainder (light agricultural lines) by private companies; of the total, 1510 miles were in the Delta. These figures do not include the military railway from Wady Halfa to Kerma and Wady Halfa to Khartum. In February, 1902, it was announced that an agreement had been made between the Egyptian government and the Suez Canal Company for the construction of a railway between Ismailia and Port Said and a commercial harbor at the latter town. The state telegraph lines at the beginning of 1902 had a length of 2365 miles with 9934 miles of wire. See SUEZ CANAL.

Lord Cromer's report for 1901 (published in 1902) showed steady progress in Egyptian development under British administration. "In Egypt proper it may be said that the foundations on which the well-being and material prosperity of a civilized community should rest have been laid." Lord Cromer noted improvements in finance, irrigation, locomotion by rail and by road, prison conditions, and otherwise. He said that in Egypt proper "for all practical purposes the institution of slavery no longer exists," and that the main interest of anti-slavery operations had been transferred to the Soudan, while the courbash as an instrument of government had been virtually abolished. The progress of education, however, though accelerated as much as possible by Lord Cromer, necessarily has been slow. But on the whole, as he points out, although British administration in Egypt is a system "replete with anomalies and theoretical imperfections . . . all the main features of western civilization have been introduced with such adaptations as have been necessitated by local requirements." For Egyptian archæology and the Egyptian Exploration Fund, see ARCHÆOLOGY; for the Assuan Dam, see DAMS.

Egyptian Soudan.—The Egyptian Soudan, under the joint administration of the British and Egyptian governments, extends from the southern boundary of Egypt (the 22d parallel) to Albert Nyanza and the northern frontier of Uganda. The area is estimated at 950,000 square miles. The inhabitants were estimated to number about 10,000,000 before the revolt of the Mahdi (the Sheikh Mohamed Ahmed of Dongola) in 1882, but during his rule and that of his successor, the Khalifa (Abdullah el Taishi), there was an appalling depopulation and the country lapsed into ruin. The Khalifa's Dervish army was defeated by General Kitchener at Omdurman September 2, 1898, and on November 24, 1899, he was killed by the forces of Col. Sir Reginald Wingate. The joint administration of the country was undertaken with the convention of January 19, 1899, between the British and Egyptian governments. There are six provinces (Khartum, Dongola, Berber, Kas-sala, Sennar, and Kordofan) and three administrative districts (Wady Halfa, Suakin, and Fashoda), all of which are administered by military governors, under the governor-general, Sir Reginald Wingate, sirdar of the Egyptian army. The capital is the growing city of Khartum. The estimated revenue and expenditure for 1902 were £E224,374 and £E614,095 respectively, the deficit of £E389,721 to be made up by Egypt.

Under Anglo-Egyptian rule the Soudan has made considerable progress; the efforts of Sir Reginald Wingate and his inspector-general, Sir Rudolph von Slatin, have been mainly toward the rehabilitation of industries and transport facilities. Lord Cromer, however, has pointed out that in progress the Soudan naturally falls behind Egypt and that any notable changes in the near future are hardly to be expected. After extensive journeys in the Soudan, Sir Rudolph von Slatin, returning to England in the summer of 1902, said that in general the country was tranquil and reports of the disaffection of the sultan of Darfur were entirely untrue. He believed that the Senussi movement (for which see FRENCH SOUDAN) had little influence in the Egyptian Soudan, and that its leader was "a peaceful man whose only desire was that Moslems should lead a strict life." As to communications the inspector-general said that the cutting of the sudd from the Nile had rendered that waterway from Khartum to Uganda open throughout the year. In the Bahr-el-Ghazal the government was opening the Djur River, by which steamers will be able to ply between Khartum and Wau, the chief station of the district (Fashoda), thus obviating a land transport journey of 120 miles. So excellent are water communications in the Soudan that General von Slatin believes the proposed construction of the Cape-to-Cairo Railway between Khartum and Uganda will be unnecessary. He strongly recommended, however, the construction of a line from Berber to Suakin. Another line is proposed to extend from Khartum westward to the state of Wadai (French).

On November 30, 1898, General Kitchener proposed that "at Khartum there should be founded and maintained with British money a college bearing the name of the Gordon Memorial College, to be a pledge that the memory of Gordon is still alive among us, and that his aspirations are at length to be realized." He added: "We should begin by teaching the sons of the leading men, the heads of villages, and the heads of districts. The teaching in its early stages would be devoted to purely elementary subjects—such as reading, writing, geography, and the English language. Later, and after these preliminary stages had been passed, a more advanced course would be instituted, including a training in technical subjects specially adapted to the requirements of those who inhabit the valley of the Upper Nile. The principal teachers in the college would be British, and the supervision of the arrangements would be vested in the governor-general of the Soudan. I need not add that there would be no interference with the religion of the people." Plans were made immediately for carrying out this project along the lines suggested, the necessary money was quickly subscribed, and on January 5, 1899, the foundation stone was laid by Lord Cromer not far from the old Burrie fort which Gordon defended during the siege. On November 8, 1902, the college was formally opened by Lord Kitchener, who was on his way from England to take command of the army in India. The headmaster is Mr. J. Currie.

For the Anglo-Abyssinian treaty of May 15, 1902, see ABYSSINIA.

EISENLOHR, August, a German Egyptologist, died at Heidelberg, February 24, 1902. He was born in Mannheim, Baden, October 6, 1832, and at first followed the theological courses of Göttingen and Berlin universities; but, prevented by illness from finishing, he began the study of the natural sciences with especial attention to chemistry, which he studied under Professor Bunsen and Professor Erlenmeyer. After receiving the degree of Ph.D. in 1859, he established himself in the manufacture of color, but in 1864 became interested in the study of hieroglyphics under Chabas and Brugsch, and in 1869 was appointed private-docent of the Egyptian language and archæology at Heidelberg. In the same year he made extended tours through Syria, Greece, and Egypt, and at Alexandria studied the Harris papyrus which later became the property of the British Museum, and of which he published a description and translation in 1872. He was nominated professor-extraordinary at Heidelberg in 1872, and became an honorary professor in 1885. Besides a revision of the second part of Baedeker's *Egypt*, he published *The Political Condition of Egypt Before the Reign of Rameses III.* (in the transactions of the London Society of Biblical Archæology, 1872), and *Ein Mathematisches Handbuch der alten Ägypter* (1877).

ELECTRICAL SHOCK, as a cause of death, is still a more or less obscure subject. F. B. Aspinwall, an English engineer, endeavors to answer several interesting questions in regard to the cause of death and the phenomena accompanying electrical accidents. He says that it is probable that not every one is equally susceptible, and that there are a number of diseases, especially such as affect the general nutrition and strength, which render a fatal result probable. The path taken by the current is important; if the vital organs be directly in the transit of the current, the result is apt to be instantly fatal. Severity of shock is proportional to perfectness of contact. Death is usually accompanied by a peculiar cry, inspiratory in character, which is probably due to the tremendous spasm of all the muscles accompanying death and directly dependent upon spasms of the diaphragm. Direct

currents are more destructive within the same limits than the alternating. While little can be done for persons suffering from electrical shock, the writer suggests that the head should instantly be lowered to make the blood gravitate to the brain. He cites two cases where this was done, and recovery resulted after a shock of two thousand volts. On the other hand P. J. Gibbons, of Syracuse, N. Y., holds that much may be done to resuscitate a person unconscious from an electrical shock. He advises using Sylvester's method of artificial respiration and then applying heat to the body. After respiration is resumed, brisk friction of the limbs should be practiced, always rubbing toward the heart. Gibbons has devised a double bellows which is connected by means of a tube with the nostrils. This apparatus alternately pumps air out of and pumps air into the lungs. It should be used continuously for from three to six hours, and may be resumed after respiration has been restored and then has failed again. Gibbons advises physicians to use electricity as an adjuvant.

ELECTRIC LIGHTING. The Nernst lamp came into commercial use during 1902. It was invented by Professor Nernst, of Gottingen, but has been developed in this country by a number of electrical engineers. Use is made of a small rod or strip, called the glower, composed partly of some of the rare earths. This refractory material is an insulator at ordinary temperatures, but at high temperatures becomes a good conductor and luminant. The rod replaces the filament of the incandescent lamp, but is not enclosed in a vacuum. To bring the lamp into service the material must first be raised to incandescence and for this purpose a heating device is arranged. This glow lamp produces a white light of uniform quality. The life of the glower is placed as high as 800 hours of service, and of the heater at 2500 hours. The Nernst lamp is said to fill the gap between the larger incandescent and the smaller arc lamps. The well known incandescent lamp is now made in sizes ranging from 4 to 150 candle-power, besides the tiny lamps for special purposes. The 16 candle-power lamp dominates, but for interior illumination there is a tendency to use smaller lights, and more of them, thus giving a better distribution of the light, avoiding glare, and making possible far more artistic effects. In arc lighting, enclosed arcs are rapidly superseding the open type. The use of alternating currents for arc lighting also continues to increase. The combination of light and power plants, and the increased size of generating stations, also continue. In fact, consolidations of different classes of service are not stopping here, for it is now common to find a single company controlling the street railway, electric power, gas and electric lighting, central heating, and water supply service of a community, and frequently combinations of several of these undertakings extend over a number of municipalities.

ELECTROLYSIS OF GAS AND WATER PIPES. The electrolytic injury to gas and water mains caused by stray electric currents from trolley street railway lines not properly provided with circuits for returning the current to the powerhouse continues unabated, but municipal authorities are trying hard to place the responsibility for such action upon the street railway companies, and to secure injunctions against the use of water and gas mains for return circuits. The city of Dayton, O., in April, 1902, obtained an injunction from the court of common pleas of Montgomery County, ordering the City Railway Company to introduce such improvements in its system as would make it "conform with the present standard of the art of operating single trolley roads." The court also declared that the company had been and then was "operating its road in a negligent manner, causing continual damage to the water pipes of the plaintiff." The decision in full, together with a review of the case, is given in the thirty-second annual *Report* of the Dayton Water Board (Dayton, O., 1902). The city of St. Paul, early in 1902, brought suit against the Twin City Rapid Transit Company, for \$500,000 damages to the city water mains on account of electrolysis, and asked an injunction to prevent further damage. Norfolk, Va., and Atlantic City, N. J., passed ordinances in 1902 for the prevention of electrolysis. The North Shore Gas Company of Waukegan, Ill., has installed rubber-packed Dresser expansion joints 1200 feet apart, in a long gas main, supplying a number of towns, and to give further insulation it has cut the pipe line in two places and made a break of ten feet in each case by inserting insulating couplings with rubber packing. The gas main is paralleled for thirteen miles by a trolley line, and tests showed that the gas main was returning 25 per cent. of the trolley current to the powerhouse. These statements are based on a paper on *Electrolysis of Underground Metals*, by Mr. Edwin J. Humiston, read before the Western Gas Association early in 1902. Attempts to prevent electrolysis in Great Britain were reviewed by Mr. W. H. Humphreys, Waterworks Engineer of York, England, in a paper read before the British Association of Gas Engineers in the autumn of 1902. An abstract of the paper, with the electrolysis regulations in full, of the British Board of Trade, was published in *Engineering News* (New York) for October 2, 1902.

ENGLAND. See **GREAT BRITAIN.**

ENGLAND, CHURCH OF, the "established" church "in its recognition as the national organization for the maintenance of Christian belief and practice." It is administered through two provinces, Canterbury and York, each of which is presided over by an archbishop. There are, besides the 2 archbishops, 33 diocesan bishops (England and Wales), 22 suffragan bishops, 8 assistant bishops, and 90 colonial and missionary bishops. The clergy in England and Wales number about 30,000, the parishes, 14,000, church sittings (estimated), more than 6,000,000. The total of voluntary offerings in 1902 was \$41,085,000, of which \$3,000,000 was contributed to home missions, and a sum exceeding \$4,100,000 to foreign missions.

The confirmation of Canon Gore as bishop of Worcester was the occasion of considerable disturbance, several persons objecting to his confirmation. Notable among them was John Kensit (*q.v.*). The opposition, having presented several grounds for their attack which were ruled out by the vicar-general, appealed successfully for a mandamus compelling the hearing of their cause. The lord chief justice, however, gave a decision upholding the vicar-general and vacating the writ. Canon Gore was consecrated February 23, 1902. One of the noteworthy events of the year was the healing of the Natal schism in South Africa which had existed some forty years, having been caused by the treatment of Bishop Colenso at the hands of the ecclesiastical authorities. The Anglican Synod in Canada, which convenes every six years, met in 1902 in Montreal. Its most important action was the organization of a general missionary society to represent the entire church in Canada—a movement in behalf of greater administrative efficiency, especially of promoting the interests of the church in the western provinces. The Anglicans of Canada number nearly 650,000. There was, during 1902, considerable discussion on a distinctly perceptible approach between Anglicans, particularly those opposing the "High Church" tendency, and non-Conformists; but, on the other hand, the bitterness aroused by the Education Bill probably is more than sufficient to offset any true progress toward sympathy. (See **GREAT BRITAIN**, paragraph Education Bill.) The forty-second annual Church Congress was held at Northampton, beginning October 4, 1902. Among a number of interesting topics were *Home Reunion*, the *Duty of the Church in South Africa*, *Christianity and Social Questions*, and *The Miracles and Supernatural Character of the Gospels*. In 1903 the congress will meet at Bristol. The Most Rev. Frederick Temple (*q.v.*), archbishop of Canterbury and primate of all England, died December 23, 1902.

ENGLISH, THOMAS DUNN, best known as the author of "Ben Bolt," died at Newark, N. J., April 1, 1902. English, whose name was a corruption of Angelos, was born in Philadelphia, Pa., June 29, 1819. He graduated in medicine at the University of Pennsylvania in 1839, after brief practice read law at Philadelphia, and in 1842 was there admitted to the bar. From 1844 to 1852 he was a journalist in New York City, where in 1845 he edited the one volume of a literary magazine, *The Aristidean*; in 1848 became connected with *John Donkey*, a humorous periodical, and was constantly active as a contributor to the press of both verse and prose. After residence in Virginia in 1852-59, he resumed medical practice in New Jersey. In 1863-64 he was a member of the New Jersey Assembly, and represented his district in Congress from 1891 to 1895. In 1900 he was placed in nomination for the State Assembly, but failed of election. During his public career he was known as an effective debater, a tariff-reformer, and an advocate of workmen's rights. Within the general mind he lived—to his own perplexity and displeasure—largely by his ballad "Ben Bolt," written for Willis's *Mirror* in 1843, once much sung to Nelson Kneass's music, and revived in popularity through its introduction into Du Maurier's *Trilby* (1894). Another poem, *The Gallows Goers*, with capital punishment as subject, was widely circulated. Dr. English further wrote essays and pamphlets unreckoned: 1844 (1847), a political satire; *Ambrose Fecit*, or *the Peer and the Painter* (1864); *American Ballads* (1882); *Jacob Schuyler's Millions* (1886); *Select Poems* (1894); and other volumes. He received the degree of LL.D. from William and Mary College in 1876.

ENTOMOLOGY. The important advances made in entomology during 1902 were not of such general significance as to attract the attention of the public, and what is to be regarded as the most important depends very largely upon the point of view. For those whose interest in entomology is based chiefly upon the systematic side of the science, the numerous publications relating to new species and

new classifications will seem of the most importance, while to those whose interest is on the economic side the discussions of means and methods of combating insect foes and encouraging insect allies will appeal more strongly. To the general reader, however, the investigations into the psychology and habits of insects and their relation to man's comfort will prove especially attractive. Most of the work along these lines has been done in connection with either ants or mosquitoes, and many interesting facts and conclusions have been recorded. Students of ants seem to be coming more and more unanimously to the opinion that the intelligence of these insects has been greatly overestimated and that acts of intelligence are really exceptional, their actions being almost entirely instinctive. Among many writers on these questions, Prof. William M. Wheeler, of the University of Texas, is entitled to special mention because of the large amount of work he has done in ascertaining the facts in the life-histories of our American ants. One old story illustrative of ant intelligence has received its quietus from him, and that is the one in which certain Texan ants were reported actually to sow and harvest the seeds of certain grasses. Wheeler has demonstrated that these ants do not intentionally do anything of the kind, and he aptly says there is no more reason for attributing cultivation of these grasses to the ants, than there would be for attributing peach-culture to a cook who threw out peach stones on a dump, where they subsequently sprang up. The nesting habits of numerous species of ants, and their polymorphism, have been recounted in numerous papers by Wheeler, Brues, Heath, and others.

The work upon the mosquito problem in 1902 was continued along lines similar to that of previous years. In West Africa the campaign against the pest went on under Major Ross, who believes that the first law for tropical sanitation is *No stagnant water!* There is nothing especially important to report from that field. In America, the chief fields of effort were in New Jersey and on the north shore of Long Island. The report on the work done along the latter water-front was published early in the summer, and is especially notable because it includes important reports by such well-known scientists as Prof. Nathaniel S. Shaler, of Harvard, and Prof. Charles B. Davenport, of the University of Chicago. While the systematic entomology of the report appears to be open to criticism because of a failure to distinguish between the different species of mosquito, on the whole this pamphlet is a most valuable record of progress and will be of use wherever the systematic elimination of mosquitoes is to be undertaken. In New Jersey, the State entomologist, Prof. John B. Smith, attempted to secure the passage of a bill by the legislature authorizing the State Agricultural Station to expend \$10,000 in investigating the mosquitoes and the best methods of lessening their numbers. Strangely enough the bill met with much opposition and was not passed until the closing days of the session. But no appropriation was made. The governor, however, assigned the sum of \$1000 from an emergency fund under his control, with the aid of which Professor Smith investigated the conditions that favor the transmission of malaria in certain districts, the food habits of vertebrates inhabiting mosquito-breeding waters, the effects of poisons on mosquito larvæ, and a preliminary survey of the salt marsh region. It is greatly to be hoped that the next legislature will provide adequate means for the proper prosecution of the work.

Before passing on to a brief survey of the year's most important entomological literature, it may be of interest to record the fact that several large collections of insects changed hands during 1902. Thus we find that the Carnegie Museum in Pittsburg, Pa., secured the Engel collection of the lepidoptera of western Pennsylvania, which contains about 12,000 unusually well preserved specimens, representing nearly 2000 species, while the University of Chicago purchased the Ackhurst collection of Brooklyn, which contains some 50,000 specimens of insects.

Literature.—As is usual in entomological literature, systematic monographs had in 1902 the most conspicuous place. Of these the largest and most important appeared early in the year from the press of the British Museum and is called *A Monograph of the Culicida of the World*. The author is F. W. Theobald. This work consists of three volumes, of which the last is entirely colored plates; there are nearly 850 pages of letter-press. Owing to the present great interest in mosquitoes the appearance of this monograph is most timely and it will doubtless prove of great use. A most important and practical book dealing with the mosquito question is Maj. Ronald Ross's *Mosquito Brigades and How to Organize Them*. Although a volume of only 98 pages, it is full of valuable information, as shown by some titles of sections chosen at random; "How to Raise Funds," "Organization of the Brigade," "Destruction of Larvæ." Another most important systematic monograph is W. L. Distant's *Rhynchota*; *Heteroptera* in Blanford's *Fauna of British India*, a volume of nearly 500 pages and yet dealing with only three of the eleven families of Rhynchota known to occur in India. A somewhat smaller but equally important paper is on *The Tettigida of North America*, a volume of 188 pages, by Dr. J. L. Hancock. The author recognizes nearly 90 species of grasshoppers of that

family of which rather more than half occur in the United States. In the serial publication *Fauna Arctica*, two numbers appeared in 1902 relating to insects; one by C. Schaffer on the *Collembola*, and the other by A. Pagenstecher on the *Lepidoptera*. The former includes about 80 species, the latter nearly 1000. Among popular books the most important is *Injurious and Useful Insects*, an introduction to economic entomology, by the well-known English entomologist L. C. Miall. This is a volume of over 250 pages with more than 100 illustrations, and although primarily intended for English students, there is much in it to interest and instruct Americans.

Organization.—The Association of Economic Entomologists held two meetings in 1902 owing to the midwinter meeting of the American Association for the Advancement of Science. The first meeting was held at Pittsburg, Pa., June 27-28, in connection with the summer meeting of the American Association. Some fourteen papers were presented, of which five dealt with the San José scale, and four with insecticides. Officers for the ensuing year were elected and the meeting adjourned to meet in Washington, D. C., during convocation week (Christmas holidays). During the Washington meetings steps were taken toward the reorganization of an American Entomological Club.

EPILEPSY. Statistics concerning the length of life in this disease have been collected by Dr. J. Carton, of Paris. Nearly five hundred cases were studied. The author found that from five to ten years, 11.9 per cent. die; from ten to fifteen years, 14.3 per cent.; from fifteen to twenty years, 22.4 per cent.; from twenty to twenty-five years, 9.6 per cent.; from twenty-five to forty-five years, 6.4 per cent. Below five and above forty-five there were very few deaths. The average age of death was twenty-five years and two months. Nearly a third died of severe or prolonged convulsions, a little over a third died of pulmonary troubles, such as tuberculosis and pneumonia; and a small proportion of deaths were due to asphyxia or injuries sustained in a fit. The treatment of this disease, as is well known, has always been unsatisfactory, and has consisted, as far as medicine is concerned, in the administration of the bromides. In order to intensify their sedative effect, and to create an artificial demand for the bromides, or "salt hunger," the so-called "bromide-diet" has been adopted in some institutions. This consists in the withdrawal of common salt and meat from the dietary, and the substitution of articles deficient in salt. By this means much larger doses of the bromides are tolerated. In connection with these measures Dr. M. Lion has given cerebrine or opocerebrine with remarkable success. Chronic epileptics of the worst type were benefited and their irritability and criminal propensities allayed. See **CEREBRINE**.

EPISCOPAL CHURCH. See **PROTESTANT EPISCOPAL CHURCH**.

EPISCOPAL CHURCH, REFORMED. See **REFORMED EPISCOPAL CHURCH**.

EPWORTH LEAGUE, a society in the Methodist Episcopal Church, organized in 1889 and officially recognized by the General Conference of 1892, the object of which is to promote spiritual development, especially among the young people of the church. Its enrollment now includes 21,366 senior chapters and 8082 junior chapters, 202 affiliated Christian Endeavor societies, and 100 junior Christian Endeavor societies. During 1902, 753 senior and 634 junior chapters were chartered. International conferences have been held every two years since 1893; that of 1903 will meet in Detroit, Mich. The official organ of the Epworth League, the *Epworth Herald*, edited by Dr. J. F. Berry, was first published in 1890. President, Bishop I. W. Joyce, D.D.; general secretary, Rev. J. F. Berry, D.D.; general treasurer, R. S. Copeland, M.D.; central office, 57 Washington Street, Chicago, Ill.

EPWORTH LEAGUE OF THE M. E. CHURCH, SOUTH, is similar in purpose and organization to that of the northern church. It was established in 1891 in Memphis, Tenn., and has, according to the latest statistics available, 115,099 members enrolled in 3234 chapters. Its headquarters are in Nashville, Tenn., and the official organ is the *Epworth Era*. President, Bishop A. W. Candler; general secretary, Rev. H. M. Du Bose, D.D., Nashville, Tenn.

ERITREA, or ERYTHREA, an Italian colony on the western coast of the Red Sea, extending from the Egyptian Soudan to French Somaliland, has an estimated area of 88,500 square miles and an estimated population, which is largely nomadic, of 450,000. There were enumerated in 1899 327,502 natives and 2014 Europeans. The colony is administered by a governor, resident at Massawah, the chief town and port. For the fiscal year 1900 the estimated revenue and expenditure were 2,456,700 lire and 10,587,500 lire respectively; for 1901, 2,299,700 lire and 10,430,500 lire. (The lire is worth 19.3 cents.) Deficits are made up by Italy. The most important industry is the raising of cattle and other live-stock. The imports (by land and sea) and exports of Massawah in 1899 were valued at 9,071,391 lire and 1,628,154 lire respectively; in 1900, 9,376,543 and 2,745,470 respectively.

On May 15, 1902, Italy, Great Britain, and Abyssinia agreed to a modification of the boundary between Eritrea and Abyssinia and the Egyptian Soudan. On May

19 the annexation of Raheita to Eritrea was announced. This was brought about by disturbances caused by the sultan of Raheita. For a number of years the district had been under the protection of the Italian government. For an account of Italy's retaliation in 1902 for the piracies off Massawah, see ARABIA (paragraph Red Sea Piracies).

ESCOBEDO, MARIANO, a Mexican revolutionary, active in resisting the Empire of Napoleon III. in Mexico, died May 22, 1902. He was born in Galeana, Nueva Leon, January 12, 1827, and early distinguished himself by his services as a guerrilla leader against the Americans when General Taylor invaded Mexico. He came into notice again as a revolutionary leader in 1854, fighting for the Liberals against Miramon and in behalf of Juarez, who was eventually successful and became the head of the government. By this time he had attained the rank of brigadier-general. His next notable services were in behalf of the republican government when Napoleon III. interposed in Mexican affairs in 1861 with the object of making that country a dependency and an American outpost of France. Escobedo took part in several actions against the French, but, after Maximilian was made emperor in 1864 retired to Texas and recruited a mixed army at the head of which he returned in 1865. He defeated the emperor's forces at San Jacinto, and besieged and captured the heights of San Gregorio, taking prisoner Maximilian (May 14, 1867), who was afterwards condemned to death and executed. He further aided Juarez in suppressing a revolutionary movement, but, after the triumph of the insurrection under Diaz, he went to New York City. After again returning to his native country and making an abortive attempt to overthrow Diaz, he was finally given an office by the government, which he held until 1883, then retiring into private life.

EUPHRATES VALLEY RAILWAY. See TURKEY (paragraph Bagdad Railway).

EVANGELICAL ASSOCIATION, popularly called the German Methodist Church, was founded by Jacob Albright in 1800. Statistics for 1902 indicate an increase in membership over the preceding year of 2731, the denomination now having 122,667 communicants, with 1100 ministers in active service, and 1860 churches. The aggregate value of church property is \$6,416,934. There are conferences of the Evangelical Association in the United States, and in Canada, Germany, Switzerland, and Japan. Its educational interests are represented by five institutions. The publishing house of the denomination, in Cleveland, O., issues a number of periodicals, both English and German, among which the *Evangelical Messenger*, established in 1848, is well known. The Young People's Alliance has a large membership and is one of the most flourishing institutions of the church. The Evangelical Association was among those churches named in the appeal for federation issued by members of the United Brethren in Christ (*q.v.*) In 1903 will be held the next general conference which has met regularly since 1843 in quadrennial sessions. See UNITED EVANGELICAL CHURCH.

EVANS, HENRY CLAY, retired in 1902 from the position of commissioner of pensions, which he had held since 1897, and was at once appointed by President Roosevelt to succeed the late William McKinley Osborne as consul-general at London. He was born in Juniata County, Penn., June 18, 1843, and removed with his parents to Wisconsin, where he received an academic education. He served in the Forty-first Wisconsin Volunteer Infantry during the Civil War, and at its close remained in the South, establishing himself at Chattanooga, Tenn., in the manufacture of railway cars. He became prominent in municipal affairs in Chattanooga, and was twice mayor. In 1888 he was elected as a Republican to Congress, before the end of his term was appointed assistant postmaster-general, and served until after Cleveland's inauguration in 1893. In November, 1894, he was elected governor on the face of the returns, but a recount by the Democratic legislature as a result of certain alleged irregularities, resulted in his rejection by a strict party vote. He was a prominent candidate for the Republican nomination for Vice-President in 1896, and received next to Garret A. Hobart the largest number of ballots in the convention. In 1897 he was appointed commissioner of pensions by President McKinley. His business-like and judicious administration, and his refusal to recommend the payment of pensions without absolute proofs, aroused the hostility of the professional pension-attorneys and claim-agents, who succeeded in making a large number of the Grand Army veterans believe that the commissioner was opposed to all pension legislation. In spite of continued attacks from various veteran organizations, however, Commissioner Evans remained in office until 1902, when, feeling that his usefulness was impaired by these attacks, and that he was a drag on the administration, he asked to be relieved.

EXPERIMENTAL PSYCHOLOGY. See PSYCHOLOGY, EXPERIMENTAL.

EXPERIMENT STATIONS. See AGRICULTURE and ZOOLOGICAL EXPEDITIONS AND STATIONS.

FAIRCHILD, JAMES HARRIS, American educator, died March 19, 1902, at Oberlin, O. He was born November 25, 1817, in Stockbridge, Mass., and in 1834, as a member of the first freshman class of Oberlin College, entered upon his relations with that institution, which as student, teacher, and president, were to continue for sixty-three years. He graduated in 1838, completed the theological course in 1841, in the following year was appointed professor of Latin and Greek, in 1847 became professor of mathematics and natural philosophy, in 1858 was elected associate professor of theology and moral philosophy, and in 1867 was chosen president of the college. Although he retired from the presidency in 1889, he continued to conduct courses in the college and in the theological seminary until 1897. He received the degrees of D.D. and LL.D. from Oberlin, and published *Moral Philosophy*; *Needed Phases of Christianity*; *Elements of Theology*; and *Woman's Right to the Ballot*.

FALCONIO, DIOMEDE, apostolic delegate to the United States, in succession to Cardinal Martinelli, assumed the duties of his new office at Washington, D. C., November 20, 1902. He was born in 1842 at Prescocosanza, in Abruzzi, Italy, and at the age of eighteen entered the order of St. Francis. Sent to the United States in 1865, in the following year he was ordained priest at Buffalo, N. Y., and from that time was entrusted with responsible positions in his order. In 1892 he was appointed bishop of Lacedonia, Italy, and three years later archbishop of the united sees of Arcadenza and Matera. In 1899 he was appointed Papal delegate to Canada.

FARLEY, JOHN MURPHY, who, in 1902, succeeded Archbishop Corrigan as primate of the Roman Catholic diocese of New York, was born April 20, 1842, at Newton Hamilton, Ireland. He studied in the United States and at the American College at Rome, where he was ordained priest in 1870. For the two following years he was assistant rector at New Brighton, Staten Island, N. Y., after which he was secretary to Archbishop McCloskey. In 1884 he became private chamberlain and secretary to the Pope. His connection with the archdiocese of New York began in 1891, when he was appointed vicar-general, and four years later he became assistant bishop upon the creation of that office. In 1895 he was also made titular bishop of Zeugma. Upon the death of Archbishop Corrigan, he was the unanimous choice for successor among the clergy of the diocese and the bishops and archbishops of the United States.

FARM ANIMALS. See AGRICULTURE and DAIRYING.

FARMERS' INSTITUTES. See AGRICULTURE (paragraph Agricultural Education).

FAYE, HERVÉ AUGUSTE ETIENNE ALBANS, a French astronomer, the discoverer of the comet which now bears his name, died September 4, 1902. He was born October 1, 1814, at St. Benoit-du-Sault, Indre, France, and in 1832 entered the Ecole Polytechnique, but gave up the course to go into business, which in turn he abandoned to enter the observatory of Paris, as a student, in 1836. In November, 1843, he made his great discovery, for which the Academy awarded him the prix Lalande and elected him a member in 1847. In 1848 he was instructor in geodesy at the Ecole Polytechnique, and in 1854 professor of astronomy in the faculty of sciences at Nancy. He became a member of the Bureau des Longitudes in 1862, professor of astronomy at the Ecole Polytechnique in 1873, and president of the Bureau des Longitudes in 1876. He was chosen to the Legion of Honor in 1843 and became a grand officer in 1889. Among his works may be mentioned: *Parallaxe d'une étoile anonyme de la Grande Ourse* (1846); *Mémoire sur l'anneau de Saturne* (1848); *Sur les Cyclones solaires* (1873); *Sur la Formation des nuages et de la grêle* (1875); *Sur l'Origine du Monde* (1884), in which a system of cosmogony wholly different from that of Laplace is developed.

FEDERATED MALAY STATES, occupying a part of the southern Malay Peninsula, are under the protection of Great Britain and administered under the advice of a British resident-general. The federation comprises Perak, Selangor, Pehang, and Negri Sembilan, the latter itself a confederation of nine small inland states. The aggregate area is about 26,500 square miles, and the population, which was 418,509 in 1891, had increased to 676,138 in 1901, and was growing rapidly, due principally to the large influx of Chinese. Each state is governed by its native sultan, advised by a British resident. There is a British resident-general for the federation subject to the high commissioner, who is the governor-general of the Straits Settlements.

The revenue, which amounted to only about 1,000,000 dollars in 1874, when the states were brought under British control, amounted to 15,609,807 dollars in 1900, and to the unprecedented amount of 17,500,000 dollars in 1901. The expenditure amounted to 12,728,900 dollars in 1900, and almost equaled the revenue in 1901; but in the latter year it was exceptional, as it included two years' expenditure under certain heads. The largest source of revenue is the export duty on tin,

which in 1900 amounted to over 7,000,000 dollars. The British dollar is equal in value to the Mexican.

The States are in a prosperous condition commercially and industrially. The total commerce increased from 98,750,000 dollars in 1900 to over 102,500,000 dollars in 1901, over 63,000,000 dollars of which represented exports. Tin, by far the most important product, was exported in 1901 to the value of more than 53,500,000 dollars. The export of Liberian coffee, the cultivation of which is being rapidly extended, amounted to 3000 tons. Rice, tapioca, sugar, and spices are also raised for export. In 1901 there were 236 miles of railway in operation, and about 100 miles additional under construction. A new line is projected to connect Pehang, on the east coast, with the other states.

FEDERATION OF LABOR, AMERICAN, was organized in November, 1881, to aid the laboring classes "by rendering employment and the means of subsistence less precarious by securing for the workmen an equitable share of the fruits of his toil." The officers are: President, Samuel Gompers, Washington, D. C.; secretary, Frank Morrison, Washington, D. C.; treasurer, John B. Lennon, Bloomington, Ill. The headquarters are at 423 G Street N. W., Washington, D. C., where the official organ, the *American Federationist*, is published. The American Federation of Labor is now the strongest and most aggressive organization of the trades unions in the United States and Canada. During the year 1902 six new national unions affiliated with the Federation were formed. The total number of charters for the year were as follows: National and international unions, 14; State branches, 6; central labor unions, 127; and local trade and federal labor unions, 877, making a total of 1024 new charters issued in 1902. At the end of the year 1902 there were affiliated with the American Federation, 99 national and international unions, with about 14,000 local unions under their authority; 27 State federations; 406 city central bodies, and 1378 local organizations directly united with the National American Federation. During the year 3500 new local unions were organized, with a membership of about 300,000. The total membership at the end of the year was put at over 2,000,000, but only 1,025,300 paid the per capita tax. The great success of the Federation, as compared with other national or international organizations of united laborers, seems to be due to its system of organization. It aims to give a distinct organization to each particular trade, beginning with the local trade union, and extending, as need arises, into State, national, and even international (Canada and the United States) organizations. Thus is utilized a well recognized principle of association, viz., the alliance of men having common interests and aims. This differs radically from the principle upon which was founded, and went to pieces, the old Knights of Labor. The latter organization worked on the principle that all laborers of all trades have identical interests. Local unions were therefore made up of all sorts of trades. Consequently there were constant strifes and discords in the local unions. The American Federation of Labor, however, uses this principle of union locally, where it is impracticable to organize the different trades separately. Two hundred and seventy-nine of these local federal labor unions, as they are called, were organized in 1902. They usually contain a preponderance of workmen belonging to the less skilled trades. As soon as a sufficient number of workers following the same employment is found, they are required to form a local trade union, having an affiliation with the State, national, or international union of that trade where such organizations exist. The plan is truly federal. The city central labor unions are organized for the purpose of bringing the different trade unions of the city together for united action in affairs of a local character. The executive head of the Federation has little real authority, and the policy of the local unions is mostly determined by itself or by the city central body.

The American Federation of Labor in 1902 steadily and vigorously opposed the demand for compulsory incorporation of trade unions, in order that they may be held legally responsible for the faithful carrying out of agreements. The unions deny that they violate agreements and object to the law on the ground that judges are likely to be prejudiced against labor and will interpret the law to injure the unions. Several times during the year trade unions violated contracts, causing severe loss to employers and others, and it seems necessary and right that the unions should be held to the same measure of responsibility as are the employers of labor. As a result of the coal strike, the question of compulsory arbitration has come more prominently before the public than ever before. Heretofore the labor unions have been solidly opposed to anything of this nature. Because of the attitude of the local operators, many labor union men now favor compulsory arbitration, although President Gompers in his annual report condemns it. The proposition was brought before the Canadian Trade and Labor Congress, where it was overwhelmingly defeated. In Porto Rico eight organizers of the American Federation of Labor were arrested, tried, and condemned to imprisonment varying from three months to four years and three months, on the charge of "conspiracy to

raise the price of labor." The case was appealed to the highest court in Porto Rico, where the decision of the lower court was reversed. On the recommendation of Governor Hunt, the first Porto Rican legislature meeting under authority of the United States revised the old Spanish code so as to permit organizations of labor formed to regulate wages, hours, etc. A number of bitter disputes between rival trade unions occurred, regarding the question of jurisdiction. The painters' union and the paper hangers' union of Washington, D. C., had a dispute as to which union should have charge of certain work in repairing the White House. After an annoying delay the matter was patched up. Two rival painters' unions in New York City got into a dispute which led to a boycott and strike of all the workmen engaged in building Mr. Vanderbilt's house, because one of the unions succeeded in getting the Building Trades Council to pronounce the other union "unfair." The brewers' union claims jurisdiction over the coopers employed by the brewing companies, which claim is vigorously opposed by the coopers' union. President Gompers thinks this internecine jealousy is the most threatening danger confronting the Federation to-day. These disputes and the open rebellion against the central authority, as in the case of the truckmen and the city central body of Chicago, seem to indicate that there is little real solidarity among the different trades, and that the federal principle, although undoubtedly superior to the principle of mixed unions, is an artificial attempt to harmonize the inherently inharmonious.

The American Federation of Labor actively pushed the child labor legislation in the Southern States, and succeeded in getting a measure passed in Kentucky, prohibiting the employment of children under fourteen years old in mills. Kansas passed a law providing for the appointment of a labor inspector at a salary of \$1200, and two assistants at \$1000 each. These officials are under the commissioner of agriculture. The same law provides for a fine of from \$25 to \$250 for the employment of children under fourteen years of age in any factory, mine, or workshop. Most of the children employed in southern mills are white, and the argument is used that unless child labor be prohibited, the whites will soon be the illiterates, because the negro children attend school while the white children work in the mills. The Federation made strong efforts to secure eight-hour laws in Congress and in many of the State legislatures. The organization wields a powerful political influence, because of its large voting strength, and is generally successful in getting such legislation as it asks for.

Labor unions have persistently fought the productive employment of convicts until now few States let out convicts to contractors or employ them in making goods to be sold in competition with the products of free labor. In January, 1902, the Illinois State Federation of Labor agreed with the governor and state prison commissioners and wardens, to approve the present system in Illinois, which allows of contract prison labor. No new contracts are to be made, however, until another legislature acts upon the matter. See CHILD LABOR, STRIKES, and TRADE UNIONS.

FEEHAN, PATRICK AUGUSTINE, Roman Catholic archbishop of Chicago, died in that city, July 12, 1902. He was born in Tipperary, Ireland, August 28, 1829, and was educated first at the College of Castle Knock, near Dublin, and then at Maynooth College, Kildare. In 1852 he came to the United States, was made president of the Carondelet Theological Seminary in 1854, became rector of the Church of the Immaculate Conception in St. Louis in 1859, and in 1865 succeeded Bishop Whelen as bishop of Nashville, Tenn. During the latter incumbency, which extended through a period of fifteen years, Bishop Feehan effected a complete reorganization of his diocese, which had greatly suffered from the Civil War, and raised to a very high grade the educational efficiency of its parochial schools. He was also the founder of the fraternal order Catholic Knights of America, established in 1877, the first insurance organization founded for Catholics alone. In 1880 he was consecrated archbishop of Chicago.

FELDSPAR. See MINERAL PRODUCTION.

FENCING maintained, in 1902, a very active season, particularly among the colleges, where it has become a leading sport. The championship tournament of the Intercollegiate Fencing Association, held in New York City, March 28-29, with foils, was won by the West Point team (Strong, Breckinridge, and Nichols) with 40 bouts won to 14 lost, the other teams finishing as follows: Columbia, 35, 19; Annapolis, 34, 20; Cornell, 32, 22; Harvard, 25, 29; Yale, 15, 39; Pennsylvania, 8, 46. The individual championship was a tie between Strong (West Point), Whitten (Annapolis), and Clark (Columbia), with 15 out of 18 bouts won, and was not fenced off. In dual meets Cornell defeated Pennsylvania 8-1 and Columbia 7-2, and was beaten by West Point 6-3. Yale defeated Columbia 7-2, and was beaten by Harvard 5-4, and by West Point 4-2. In addition to the victories over Cornell and Yale, West Point defeated Harvard 9-0 and Pennsylvania 7-2. The Amateur Fencers' League contests, held at the New York Athletic Club, April 25-26, resulted

as follows: Foils—J. P. Parker, Boston, won in a deciding bout with C. G. Bothner, New York, after a tie; sabres—A. V. Z. Post, New York, first, with 7 victories and no defeats; dueling swords—C. Tatham, New York, 7 victories and 1 defeat. The senior championship at foils was won by the Fencers' Club of New York, defeating the New York Athletic Club team, 5—3. The junior championship went to Columbia, who defeated Yale 5—4 for the Newbold Morris trophy. C. W. Davis, New York, won the junior championship at open foils.

FIJI, a group of about 225 islands in the southern Pacific, is a British crown colony. The total area of the group, including Rotumah, is 8045 square miles, and the population of the eighty inhabited islands (1901) 117,870, of whom 2447 were Europeans, 17,105 East Indians, and 94,397 Fijians. Suva, the capital, with a European population of 1073, is located on Viti Levu, the largest island, which has an area of 4250 square miles, about that of Jamaica. Education is largely in the hands of the Wesleyan and Roman Catholic missions, but the government supports an industrial and technical school and two public schools at Suva and Leouka. The colony is administered by a governor, who is also British high commissioner for the western Pacific. In this office Sir Henry Moore Jackson succeeded Sir G. T. M. O'Brien in 1902. He is assisted by an executive council and a legislative council consisting of official and appointed members. The colony is divided into seventeen provinces, in some of which there are European commissioners; in others the native chiefs exercise control.

The revenue in 1901 amounted to £113,853 and the expenditure to £104,973. There is a public debt of £196,095. The native taxes are paid in produce and sold by the government. Vegetation is luxuriant, and includes bread-fruit, bananas, plantain, peanuts, yams, cocoanuts, sugar-cane, tea, cotton, maize, tobacco, and arrow-root. The imports (1901) were valued at £343,636; and the exports, largely sugar (valued at £393,987 in 1900), pearl shells, peanuts, green fruit, maize, copra, and coconut-oil, amounted to £541,258, of which £472,456 went to British colonies.

FINANCE. See the articles on the United States, the States of the United States, and foreign countries; also BANKS—BANKING, and the following article.

FINANCIAL REVIEW OF THE YEAR. The year 1902 surpassed all former years in the volume of business done so far as the United States is concerned. The output of iron and steel, which is probably the best indicator of trade conditions, far surpassed any previous record. Furthermore, demand ran ahead of supply so that the extraordinary home production was insufficient, and large importations had to be made. In all lines the same activity prevailed. The following table compares by months the aggregate transactions on the New York Stock Exchange:

MONTH.	Sales of Stock (Shares).		All Classes of Bonds (Par Value).	
	1902	1901	1902	1901
January.....	14,733,391	30,207,603	\$94,030,500	\$94,988,460
February.....	12,950,699	21,881,389	84,192,500	103,741,300
March.....	11,954,672	27,001,677	66,952,200	132,401,020
April.....	26,579,732	41,688,897	114,884,900	115,875,500
May.....	13,465,777	35,199,736	63,108,600	110,357,400
June.....	7,813,049	19,819,131	64,158,800	79,868,050
July.....	16,317,957	15,920,898	71,962,200	49,477,000
August.....	14,317,393	10,771,312	53,587,300	36,821,700
September.....	20,953,087	14,030,762	94,626,950	44,684,100

November.....	17,117,813	18,360,459	54,511,700	90,895,500
December.....	15,719,742	16,672,343	60,641,600	75,365,300
Total.....	188,321,181	265,577,354	\$891,305,150	\$969,404,920

The Stock Market.—The year opened with no such wild speculation as characterized January, 1901. The bad crops of 1901, the embarrassment of the Everett-Moore syndicate of trolley and telephone promoters, and the failures of the National Asphalt Company and the Crude Rubber Company, all tended to make investors cautious. Stock sales for January were less than one-half the sales in the same month in 1901, and prices tended downward most of the month. The continued activity in trade and the full report of the United States Steel Corporation checked the waning confidence. The suit against the Northern Securities Company brought by the State of Minnesota disturbed the market considerably, and when, on February 19, President Roosevelt announced his determination to proceed against the company, a severe decline in stocks resulted. Through March the trend of prices was upward, and in April speculation became reckless. The Louisville and Nashville Railroad management issued 50,000 shares of new stock, at the same time selling themselves short. John W. Gates took advantage of the opportunity to

corner the stock; but to prevent a panic, with all the consequent evils, the whole matter, including the shares acquired, was turned over to J. P. Morgan and Company for settlement. Shares were borrowed by the shorts to cover, and the threatened crash was averted. It was persistently rumored that Morgan intended to incorporate the Louisville and Nashville with the Southern Railway, thus increasing the extent of the Morgan railway system. In September, however, the Louisville and Nashville was purchased by the Atlantic Coast Line Railroad. A great steamship combination was arranged in April by J. P. Morgan, embracing most of the lines operating in the North Atlantic, viz., the White Star, Dominion, American and Red Star, Leyland, and the Atlantic Transport Company. Purchase was not completed until December. The combination was capitalized at \$170,000,000; stock, \$120,000,000, and bonds, \$50,000,000. The transaction aroused much hostile criticism in England, where it was thought it might endanger British supremacy on the seas. On the last day of April, a sharp break occurred in International Power stock, which was quickly followed by a complete collapse of all the Webb-Meyer specialties, though Dr. William Seward Webb denied the existence of a Webb-Meyer syndicate. The properties involved and the fall in the market prices during May were as follows: Dominion Securities Company, from 118¼ to 16; Hackensack Meadows Company, from 79½ to 8; Storage Power, from 10¼ to 3½, and North American Lumber and Pulp Company, from 39¼ to 5. A report on these properties, made by an investigating committee, revealed a barren array of assets. A credulous public willing to be victimized by unscrupulous manipulators working in the dark was responsible for this working up of worthless securities. Nothing could more strongly emphasize the absolute necessity for greater publicity in the accounting of all stock companies and corporations. The strike of the anthracite coal miners aggravated the strain on the stock market, and some further decline occurred, but the market held up remarkably well, and in July considerable buoyancy prevailed. During July and August a contest for the control of the Colorado Fuel and Iron Company was waged by John W. Gates against the Osgood management. In spite of all disturbances prices continued upward. In September, however, there was extensive liquidation because of the high money rates and the calling in of loans by the banks, resulting in the severest break in prices since the panic of May, 1901. Owing to the relief measures proposed by the secretary of the Treasury, confidence was restored and the following day, September 30, the market almost entirely recovered. During October and November stocks ruled generally low, with a slight recovery at the end of the latter month. The Venezuelan trouble assumed a serious aspect, money rates soared upwards, while stocks rapidly fell. On the 12th and 13th of December many stocks reached the lowest points for the year, and a semi-panic ensued. No failures occurred, however, showing a sound condition of business. The formation of the money pool and the clearing of the South American war clouds restored confidence, and at the close of the year stocks were higher than before the depression. Everything indicates a healthy condition of affairs for the year 1903. The range of prices of leading stocks on the New York Stock Exchange in 1902 was as follows:

Banking and Currency.—The depression in the stock market and the tightness of money at the opening of 1902 were relieved by the flow of currency from the interior. The rates on call loans declined as deposits, loans, and surplus reserves increased. In May the break in International Power and the collapse of the Webb-Meyer stocks sent the rates on call loans skyward. The highest rate (25 per cent.) was reached May 5, but some of the largest financial houses, including J. P. Morgan and Company, asked only 6 per cent. Early in July the Chicago corner in corn drained much money from New York, so that rates went up again to 7 per cent. on call loans. Rates declined toward the end of the month, but went up again in August with the beginning of the crop movement from the west. In September the money market looked panicky, necessitating heroic measures of relief by Secretary of the Treasury Shaw. Cash in the sub-treasuries September 1 was \$317,734,602, against \$290,738,811 on February 1, when Mr. Shaw assumed office, although government deposits in banks had been increased from \$112,578,621 to \$125,382,170. On the 13th Mr. Shaw asked those national banks holding "free bonds"—i.e., not pledged as security for public deposits or bank circulation—to send their bonds to the treasurer in sums of \$50,000 and receive government deposits to the amount of the par value of the bonds. It was estimated that this would release about \$4,000,000 of cash from the treasury. He also anticipated the October interest on government bonds to the amount of \$4,500,000. All these measures for relief proved insufficient, and on September 20 the New York Clearing House banks showed a deficiency (\$1,642,050) in reserves for the first time since November, 1899. Mr. Shaw issued a circular September 25, offering to pay in advance, beginning October 1, the interest maturing on government bonds up to and including July 1, 1903, at a rebate of two-tenths of 1 per cent. a month, the offer to remain open until November 30, 1902. September 26 he gave notice that he would purchase

on or before October 15 at 105 flat, United States 5 per cent. bonds of 1904, of which only \$19,410,350 were then outstanding. The price attracted only \$25,300 worth of bonds. On September 27, the Clearing House showed surplus reserves of \$3,236,625, but on Monday, September 29, call money advanced to 35 per cent. and prices on the Stock Exchange went down with a crash. After the close of business, the secretary announced that he would allow the substitution of bonds other than United States bonds for part of the 2 per cents. held as security for government deposits, taking the same general class of municipal bonds as those permissible as savings bank investments in the several States. Later it was decided to accept the uncontested bonds of any city the debt of which (exclusive of water debts and sinking funds) should be less than 7 per cent. of the assessed valuation of the city. The substitution was allowed only on condition that the United States bonds thus released should be made the basis of new banknote circulation. It was also announced that banks would no longer be required to carry any cash reserve against the government deposits secured by United States bonds, amounting then to \$130,000,000, of which \$40,000,000 was at New York. The threatened panic was averted, though Mr. Shaw's acts were severely criticised as being unnecessary, illegal, and partial to the Wall street speculators. Nevertheless, cash continued to accumulate in the sub-treasuries, amounting to \$324,718,483 on October 1. In order to reduce these cash holdings, Mr. Shaw was obliged to buy bonds extensively. On October 17 a circular was issued announcing that the treasury would purchase the United States 4s of 1925 at 137 $\frac{3}{4}$ with interest to date of purchase. Bonds to \$8,253,400 face value were immediately turned in to the New York sub-treasury, for which the government paid \$11,293,789 in one day. The money market was at once eased. During the month \$15,675,250 worth of bonds were purchased for \$21,695,311 at the different sub-treasuries. The interest on the public debt due November 1, amounting to \$2,160,000, was paid in advance without discount. Government deposits in banks were increased from \$133,932,197 to \$146,885,013. In these ways cash holdings of the treasury were reduced from \$324,718,483, October 1, to \$294,466,478, November 1. National bank circulation was greatly increased through the release of United States bonds held as security for government deposits as noted above, the net increase in the amount of bank-note currency being \$11,940,045. A considerable amount of gold arrived from Australia and the Yukon, so the aggregate additions to the money in circulation amounted to no less than \$60,425,341 for October.

The course of the New York money market during 1902 is shown in the following table:

NEW YORK MONEY MARKET (1902).

	Rate of Interest.			Loans.	Deposits.	Surplus Reserves.†	Excess of Gold Imports (+); Exports (—) (United States).

							\$8,162,726

* Six per cent. plus one per cent. commission. † Nominal rate; commercial paper was practically unsalable. ‡ This is the surplus above the 25 per cent. reserve against deposits, government deposits being included as in the past.

Large payments on account of the shipping combination and the purchase of the Louisville and Nashville Railroad kept money rates high, and when the Venezuelan difficulty became serious the money market again looked panicky. On December 15 call loans were 10 per cent., with every prospect of going higher. It was announced that J. P. Morgan, James Stillman, president of the National City Bank, and George F. Baker, president of the First National Bank, had formed a pool to loan \$50,000,000 if it should prove necessary. This quickly cured the money stringency.

Though the volume of mercantile transactions was greater, the bank clearings for 1902 did not come up to the figures for 1901. This was due to the decline in speculation, the aggregate amount of sales on the New York stock market being less by \$6,213,520,468 in 1902 compared with 1901. The values of stock market transactions for the first six months of 1902 were less than half those of the corresponding period of 1901.

Considering the shrinkage in Stock Exchange business, the close approach in the amount of bank clearings for 1902 to those of 1901 indicates a great increase in general business activity. The total clearings for 1902, according to the *Financial Review* amounted to \$118,118,839,190 as against \$118,579,964,282 for 1901, showing a trifling decline of only a small fraction of 1 per cent. The clearings for 1899 and 1900, the largest previously recorded, were only \$94,178,089,238 and \$86,205,688,683, respectively. Outside of New York the bank clearings increased from \$39,152,278,440 in 1901 to \$41,790,650,025 in 1902, a growth of 6.7 per cent. The improvement in clearings outside New York extended to all parts of the country except New England, where the falling off was due almost entirely to the decrease in speculation on the Boston Stock Exchange. New York, Boston, and Detroit are the only large cities which show a decrease in bank clearings. The falling off in the last-named city was probably due to the great decline in grain shipments, owing to the short crop of 1901. The following table compares bank clearings by months in the United States during 1901 and 1902:

MONTHLY BANK CLEARINGS.

MONTH.	Clearings, Total for the United States.			Clearings, Outside New York City.		
	1902	1901	Per Cent. of Increase.	1902	1901	Per Cent. of Increase.

Railroads and Internal Commerce (see UNITED STATES, paragraph Domestic Commerce).—The year 1902 was the greatest in the history of railroading, despite the falling off in grain freights because of the short crops in 1901 and the disturbance of all industries caused by the coal strike. The grain receipts at seaboard fell off from 342,935,849 bushels in 1901 to 220,937,121 bushels in 1902. Compared with the record year (1899) the decrease was nearly 210,000,000 bushels. Flour receipts for 1902 were 21,638,882 barrels, compared with 22,528,524 barrels for 1901. A corresponding falling off in grain and flour receipts was manifest at the western shipping points. Live stock deliveries at Chicago aggregated 278,100 carloads in 1902 as against 291,741 carloads in 1901. Shipments of anthracite coal to the seaboard

declined from 42,000,000 tons to about 32,000,000 tons. The diminished quantity of coal shipped was but a small part of the loss due to the coal strike. It curtailed production in every line. Yet the activity in the general industries of the country was so great as to overcome these unfavorable circumstances. The iron and steel trades were especially prosperous. Shipments of iron ore by water from the Lake Superior region amounted to 27,039,169 tons in 1902 as against 20,157,522 tons in 1901. This meant an enormous increase in the amount of bituminous coal hauled by the railroads, in addition to the larger amounts of ore. According to the *Financial Review*, the aggregate earnings of the railroads for 1902 were \$1,542,725,832; for 1901, \$1,449,841,005—an increase of \$92,884,827 or 6.41 per cent. The enhanced earnings of the roads were largely absorbed by increased expenses, due to higher cost of fuel and supplies. Wages of employees were advanced 10 per cent. by nearly all the roads throughout the country.

The largest gains in gross earnings were made by the Pennsylvania (\$17,418,900), the Great Northern (\$6,350,357), the Northern Pacific (\$5,973,217), the Canadian Pacific (\$5,652,697), the Chicago, Burlington and Quincy (\$5,195,515), the Southern Pacific (\$3,726,283), the Baltimore and Ohio (\$3,712,882), and the Louisville and Nashville (\$3,692,205). The heaviest decreases were of course sustained by the anthracite coal roads. The decreases were: Lehigh Valley, \$3,978,850; Central of New Jersey, \$1,675,837; Reading, \$1,383,917; New York, Ontario and Western, \$806,858; New York, Susquehanna and Western, \$671,615. Only four other roads report a decline in earnings for the twelve months of 1902. These are: Texas and Pacific, \$564,063; New York, Chicago and St. Louis, \$345,975; Chesapeake and Ohio, \$259,697; and Texas Central, \$125,297. The aggregate decrease for these nine roads was \$9,812,109 for the year. The gross earnings of railroads by groups were as follows in 1901 and 1902:

GROSS EARNINGS OF RAILROADS BY GROUPS.

	1902	1901	Change Increase (+) Decrease (—)
Trunk lines	\$404,414,285	\$381,531,847	+\$22,882,438
Anthracite roads.....	73,554,281	82,071,359	—8,517,078
Southern group	147,011,661	133,784,884	+13,226,777
Southwestern group.....	312,701,135	301,093,911	+11,607,224
Middle and Western	97,283,057	89,426,860	+7,856,197
Northwestern and Pacific.....	318,984,299	288,731,204	+30,253,095
Total	\$1,542,725,832	\$1,449,841,005	+\$92,884,827

Consolidations of railways were not so numerous as in 1901, but some were remarkable for their magnitude. One of the most sensational occurrences of the year was the acquisition of the Louisville and Nashville Railroad by John W. Gates and its subsequent incorporation with the Atlantic Coast Line. The Louisville and Nashville had previously bought the Atlanta, Knoxville and Northern, while the Atlantic Coast Line had absorbed the Savannah, Florida and Western. Later on, the Chicago, Indianapolis and Louisville passed under the joint control of the Louisville and Nashville and the Southern Railway (Morgan's system), thus establishing a "community of interests" that is very significant of the future. The St. Louis and San Francisco continued its policy of aggrandizement, acquiring the Chicago and Eastern Illinois, the St. Louis, Memphis and Southeastern, the St. Louis and Gulf and other roads. The Chicago, Rock Island and Pacific acquired the Burlington, Cedar Rapids and Northern, and the Rock Island and Peoria, and bought control of the Choctaw, Oklahoma and Gulf and the St. Louis, Kansas City and Colorado, the whole being incorporated under the name of the "Rock Island Company," with a capital of \$150,000,000. The plan of exchanging \$270 in new securities for \$100 of the old stock was not favorably received on the Exchange, and was partly responsible for the sharp decline in prices.

One of the most important events of the year was the acquisition of the Western Maryland, and the Western Virginia Central and Pittsburgh railroads by the Gould interests, thus securing for their system an outlet to the seaboard. This and the plan for extending the Wheeling and Lake Erie to Pittsburg led to friction with the Pennsylvania Railroad, which found expression in the attempted exclusion of the Western Union Telegraph from the Pennsylvania system and the resignation of President Cassatt from the directory of the Mercantile Trust Company of New York. A general characteristic was the enormous new capital creations by the Pennsylvania, the Baltimore and Ohio, the New York Central, and the Illinois Central to meet the requirements of new construction, additional equipment, motive power, etc. At no time during the year were the transportation facilities sufficient to handle properly the enormous quantity of freight offered. More or

less delay and congestion occurred at various shipping centres. At Pittsburg the congestion became so serious in November that only the most heroic efforts of the Pennsylvania Railroad management prevented a complete blockade.

For commerce of the United States, see UNITED STATES (paragraphs Domestic Commerce and Foreign Commerce).

FINE ARTS. See ARCHITECTURE, PAINTING, SCULPTURE; also MUSIC.

FINLAND, on the Gulf of Bothnia, is nominally a grand duchy but practically a province of the Russian empire. It has an area of 144,255 square miles, of which nearly 13 per cent. is under lakes. The inhabitants on December 31, 1900, numbered 2,712,562, of whom about 83 per cent. were Finns and most of the remainder Swedes. There were only some 6000 Russians. Only about 12 per cent. were urban residents. The populations of the principal cities were: Helsingfors (with Sveaborg), 93,576; Åbo, 38,235; Tammerfors, 36,344; Viborg, 32,312; Uleåborg, 16,306. At the end of 1900 the Lutherans numbered about 2,662,000 and the Orthodox Greeks about 46,466. A relatively high standard of education is maintained, and, except along the Russian border, there is scarcely any illiteracy.

Government and Finance.—The grand duke is the Czar of Russia, who since 1899 has steadily violated the constitution in carrying out his plan of "Russification." The constitution provides for a diet, consisting of nobles, clergy, burghers, and peasants; its enactments may be vetoed by the grand duke. The administrative power is constitutionally vested in a senate, nominated by the crown and acting under the presidency of the governor-general. The military department is under the Russian ministry of war, and the department of foreign affairs under the Russian chancellor.

Finland has its own monetary and customs systems. The unit of value is the mark, worth 100 cents. Estimated revenue (including a balance from the previous year) and expenditures (including a surplus for the succeeding year) balanced at 88,508,916 marks in 1899, 87,506,882 marks in 1900, and 105,225,591 marks in 1902. On January 1, 1902, the public debt, which had been increased in 1901 by a loan of 24,927,000 marks, amounted to 135,367,627 marks.

Industries, Commerce, etc.—The leading industry is farming and the principal crops rye, barley, oats, and potatoes. Forestry and the wood-pulp industry are important, and there is some mining (chiefly iron) and manufacturing. According to a British consular report, published in the summer of 1902, the commerce of Finland, notwithstanding the deplorable administrative conditions brought about by the Russian authorities, was showing a satisfactory development, while the state of public finance was excellent and the country's credit good; and, despite an unusual emigration, the population was steadily increasing. Before the end of the year, however, the prosperous economic condition of the people was in large measure reversed by famine. (See paragraph Famine.) Imports and exports in 1900 were valued at 270,755,800 marks and 197,730,700 marks, respectively; in 1901, 215,600,000 and 186,900,000, respectively. The values of the leading imports in the latter year were: Cereals, 52,700,000 marks; iron, machinery, and iron goods, 26,800,000; coffee, 8,400,000; minerals, 8,200,000; sugar, 8,200,000; cotton, 7,200,000. In 1901 the values of the leading exports were: Wood, 95,600,000 marks; butter, 21,900,000; paper and wood-pulp, 21,200,000; skins and hides, 4,800,000. The imports from and the exports to the countries of greatest trade importance were, respectively, in 1901: Russia, 87,300,000 marks and 55,300,000 marks; Germany, 67,000,000 and 15,900,000; Great Britain, 25,600,000 and 52,400,000; Norway and Sweden, 12,100,000 and 6,400,000; Denmark, 9,600,000 and 13,200,000; Netherlands and Belgium, 6,300,000 and 15,600,000; France, 3,300,000 and 16,700,000. On January 1, 1902, there were in operation 1876 miles of railway, almost all of which is owned by the state.

"Russification."—The constitutional liberties of the Finnish people, which may be said to have had their beginning in the Swedish code of 1442, were recognized in Swedish parliamentary acts of 1772 and 1789; they were enlarged and guaranteed by Alexander I. of Russia, at the Borge diet in 1809, and were confirmed by Alexander II. in 1869 and by Alexander III. in 1886. The destruction of these liberties began in 1899. On January 24 of that year, Nicholas II., influenced by his reactionary advisers, particularly C. P. Pobedonostzeff, procurator of the Holy Synod; General Kuropatkin, minister of war, and the Grand Duke Michael, issued a decree making a knowledge of Russian obligatory for senators and various other high officials; and on the 15th of the following month another imperial rescript ordered that new laws affecting Finland, after submission to the diet, should be referred to the imperial state council at St. Petersburg for settlement and promulgation. Despite a practically unanimous popular protest, this order, involving the "Russification" of the country, received imperial confirmation on July 4, 1899, and in the following September M. de Pleve, a reactionary statesman, was appointed acting secretary of state for Finland. An imperial ukase of June 26, 1900, ordered the gradual introduction (within a period of five years) of the

Russian language in all the official departments and public offices of Finland. A scheme of compulsory military service had been approved by the Czar in February, 1899, but on July 11, 1901, he sanctioned a new military service law, which, though unconstitutional, the senate was constrained to promulgate on August 1. Against this measure an enormous popular petition was signed by 471,131 persons, who were said to be all self-supporting adults able to write; but it only provoked imperial displeasure. Meanwhile under the governor-generalship of M. Bobrikoff, an autocratic, tactless and seemingly brutal official, the rights and privileges of the Finnish people had been variously restricted: among other things, a drastic censorship was established, the right of assembly curtailed, and strong Russian influence introduced into the educational system. This last innovation is perhaps the most subtle and far-reaching in the work of substituting an inferior for a superior civilization, and it is that "which gives to the spectacle a peculiar poignancy." Many writers have asserted that the Czar himself has been kept in ignorance of the actual conditions attending the subjugation of the Finns, that the real onus of the trouble rests upon his advisers; this is probably in large measure true, but in the Finnish mind this imperial apostle of peace turns out to be a tyrant and an oppressor, "the Ideologue has fallen to the Iconoclast," "the 'Little Father' has withered and shrunk from his potential fatherhood into the loathed estate of the 'Assassin of Finland.'" On the other hand, it is not likely that even his reactionary advisers are moved by malice. "Homogeneity," said the London *Spectator* in August, 1902, "is the Russian ideal. They want a realm in which there shall be but one language, and one creed, and one set of political institutions. It is before this ideal that the liberties of Finland have fallen rather than from any desire to punish the Finns."

In 1902 the most noteworthy developments in the policy of abolishing Finnish autonomy were the attempt in April to enforce the new military law and the promulgation at Helsingfors on October 1 of four new imperial ordinances. Formerly the Finnish army was distinct from the Russian, but, according to the law of August 1, 1901, Finnish recruits are to be drafted into the imperial service. In order to evade conscription the people of many of the communes, early in 1902, refused to elect the conscription boards, which conduct the levy, while the entire medical board of Finland resigned to avoid appointing medical officers to examine the recruits. The conscription came on in April, but of the young men drafted only a small percentage appeared. For example, at Helsingfors out of 857 men called 57 responded, and at Viborg 32 out of 150. So great was the popular indignation that serious riots broke out in the principal towns. At Helsingfors on April 18, 1902, the crowds, which had jeered at the police and some senators (who had yielded to the Russian policy), were charged upon by Cossacks, who used their knouts indiscriminately, injuring many women and children. As a result of the resistance against the conscription, the imperial government issued a rescript— which the Finns regarded as a practical proclamation of martial law— notifying them that "disobedience to the military law would be a convincing proof of the insufficiency of the administrative system inaugurated last century to guarantee the peaceful conduct of public affairs and submission to the authorities." For resisting the conscription several municipalities were fined from 15,000 to 20,000 marks, Helsingfors 30,000, and Hammerfords 35,000. The Russian authorities stated that the government did not intend to pass over lightly the refusal of the recruits to enlist, but it did not appear exactly how the 5000 young men in question would be punished. The Finnish courts declared that the military decrees did not have the force of law, and the Viborg court acquitted the recruits brought before it. But before the end of the year, as shown below, even the strength of the Finnish law courts was subverted. The Czar granted a temporary postponement of the conscription.

Four imperial ordinances, which seemed almost the last blow to Finnish autonomy, were issued in September, 1902, and promulgated at Helsingfors on October 1. The first of these ordered that the senate, which is the central administrative body and the supreme court of justice, should be under the direct and constant supervision of the governor-general, whose consent is necessary to the legalization of all its acts. The second law enabled the governor-general and "his senate" to dismiss without legal trial any administrative official not appointed directly by the Czar. The third empowered the judicial department of the senate to dismiss judges at its pleasure. The fourth law, which was regarded as the most subversive of all, provided that no official, from the governor-general down to a policeman, should be brought to trial on any charge without the consent of his superiors. These laws, like the "Russifying" decrees preceding them, are clearly in violation of the Finnish constitution, and the cumulative effect of all is practically the nullification of that instrument.

A large emigration from Finland, induced to a great extent by the Russian

policy, continued in 1902. M. de Pleve, secretary of state for Finland, was appointed Russian minister of the interior to succeed M. Sipiaguin after the latter's assassination on April 15, 1902. For six months, however, M. de Pleve was to continue his functions as minister for Finland together with those of his new office. M. Oerstroem, of Swedish origin, was appointed assistant minister. In April, 1902, the Finns were pleased at the retirement of General Shipoff, assistant to Governor-General Bobrikoff. In March, M. Lindelöf, president of the school board of Finland, resigned on account of trouble with M. de Pleve. Lindelöf was formerly professor in the University of Helsingfors, and is well known throughout Europe as a mathematician.

Famine.—In December, 1902, it was reported that some 400,000 persons in Finland were destitute and suffering from lack of food, and that conditions were even worse than in 1867, when 100,000 persons died. In many places the peasants were reduced to living on bread made from the bark of trees. The famine was due to an unusually cold summer followed by early frosts, which ruined the oat and barley crops, while many grain fields had been swamped by floods. Relief funds at home and abroad were established.

FIRE PROTECTION. From the municipal point of view, progress in fire protection of late has consisted chiefly in general improvements in public water supply systems and in the equipment of fire departments. The quantity of water available at fires, and particularly the pressure, is gradually being made more ample and reliable. Among the contributing causes to this desirable end, are larger and stronger water mains, and better fire hydrants, reduction in water waste, and increases in the water supply itself, and in the elevation of the reservoirs, or the capacity and power of the pumping engines. During 1902 Philadelphia joined the rank of cities having special fire mains. These cities now include Cleveland, Milwaukee, Detroit, Buffalo, Providence, Boston, and Philadelphia. (See *High Pressure Fire Mains*, in *Insurance Engineering*, October, 1902, for brief descriptions of each of these special systems. At Philadelphia there are four principal supply mains, one on Market Street, with an internal diameter of 14½ inches, and one each on Walnut, Arch, and Race streets, 10 11-16 inches in diameter. These four lines are connected at intervals by cross lines, one 11-16 inches and the other 7½ inches in size. The pipes are of tough gray cast iron, with shells from ¾ to 1½ inches thick. The lengths of pipe are joined by flanges and bolts, with canvas gaskets coated with pine tar. Sleeves are provided at intervals to allow for expansion and contraction. Specially designed hydrants are provided, with connections for 3½-inch hose. Pending the completion of a special pumping station on the Delaware River, water is supplied to the fire pipe lines by means of pumps on the city fire boats. A unique feature of the permanent pumping plant will be the use of gas engines to drive the pumps. Ultimately there will be ten 280 horse-power Westinghouse gas engines, direct-connected to 1200-gallon per minute Deane triplex pumps, but only seven will be installed at the outset.

A laboratory for investigating fire protection problems has been established at Boston, under the name of the Insurance Engineering Experiment Station, with Mr. Edward Atkinson as director. Its first report, on *Fireproof Wood, So-Called*, was issued in August, 1902. For several years past the Underwriters' Laboratory at Chicago has carried on numerous experiments with fire protection apparatus and various materials and devices related to fire hazards. In 1902 a staff of twelve was employed at the laboratory, which is supported by the National Board of Fire Underwriters, and is also related to the work of the National Fire Protection Association (in the insurance interests), the consulting engineers of the National Board of Fire Underwriters, and the electrical committee of the Underwriters' National Electric Association. The various organizations named are doing an immense amount of work in the standardization of fire protection apparatus and rules, and in testing fire-resisting materials and a variety of substances and apparatus affecting fire risks.

FISH, NICHOLAS, an American banker and diplomatist, the son of Hamilton Fish, President Grant's secretary of State, died in New York City, September 16, 1902. He was born in New York City, February 19, 1848, graduated at the Columbia Law School in 1867 and at the Harvard Law School in 1869, and two years later became second secretary of the American legation in Berlin. In 1874 he was promoted to be first secretary, was *chargé d'affaires* at Berne, Switzerland (1877-81), and from 1882 to 1886 was minister to Belgium. From 1887 until his death he was prominent in New York City banking circles. He was president of the New York State branch of the Society of the Cincinnati, and a member of many metropolitan organizations.

FISH AND FISHERIES. The most important event of 1902 from a practical point of view was probably the meeting at Copenhagen, July 22 and following

days, of the International Council for the Exploration of the Sea. The project has been under discussion for four years and previous conferences have been held at Stockholm and Christiania, but this was the first meeting of the officially appointed council. All the countries of northern Europe except France and Belgium have agreed to participate and were represented by delegates, among whom are some of the most eminent European biologists. It is understood that Belgium intends to participate in the work. Dr. Hering, head of the German Sea Fisheries Association, was chosen president; and Dr. P. P. C. Hoek, the Dutch zoologist, was made permanent secretary. As practical results of direct and immediate value to the fisheries are desired, and the money is appropriated solely to attain them, the biological investigations are necessarily greatly limited. It was decided to undertake at once the study of the migrations of the most important food fishes, especially the cod and herring, and the question of over-fishing in those places most frequented by trawlers. Plans were also laid for very elaborate and accurate oceanographical investigations. The permanent headquarters of the council are to be at Copenhagen, but the international laboratory will be at Christiania.

The economic aspect of the fisheries question has occupied a great deal of attention in Great Britain, as in previous years, her zoologists being alive to the importance of government supervision. One of the very best contributions of 1902 to the discussion of such questions is the second memoir of the Lancashire Sea Fisheries Committee. It is a quarto volume of 98 pages by W. A. Herdman and Robert A. Dawson, entitled *Fishes and Fisheries of the Irish Sea*. This report might well be made the model for such reports, so completely does it cover the ground. It includes accounts of the physical features of the Irish Sea, the surface currents, the bottom deposits, the life of the bottom in all parts of the sea, and finally the fishes themselves. Of the latter 141 species are listed, of which 41 are marketable, and 18 of these are pleuronectids, or "flat-fishes." The volume also contains full accounts of sea-fisheries committees, which are analogous to the State fish commissions of America, although their methods and powers are quite different. What appears most remarkable to an American is the entire absence of any artificial propagation of fishes or other animals. In this connection, reference should be made to the letter of Earl Grey in the London *Times* early in May, 1902, in which he calls attention to the great accomplishments of the United States Fish Commission on the western coasts of America, where the shad and striped bass have been introduced and now yield profitable fisheries, and more recently the artificial propagation of salmon has met with the greatest success. Nevertheless, sentiment in Great Britain seems to be against that government undertaking any similar work, skepticism as to its real commercial utility still being widely prevalent.

In America, the work of the Fish Commission went steadily on in 1902, with the usual excellent results. A bill was passed by Congress authorizing the fish commissioner to establish a biological station on the Great Lakes at some appropriate point, which he may select, and \$10,000 were appropriated for selecting and securing land and water-front for such a station. The need of such a station has been felt for some time, and it is to be hoped that the commission will not have to wait long for the necessary appropriation for buildings and equipment. The *Fish-hawk* spent the winter on the southeastern coast of the United States and during the summer was at Beaufort, where she did important survey work. The *Albatross* was collecting among the Hawaiian Islands during the first nine months of the year, and after her return was hauled up at San Francisco for repairs. For further particulars as to her work, and for accounts of the work of the laboratories at Woods Hole and Beaufort, see ZOOLOGICAL EXPEDITIONS AND STATIONS.

Among the important investigations which have been carried on during the year or which have been reported in print, two are of much interest. One was upon the effects of spurge-poisoning on salmonoid fishes, and was made by Dr. H. M. Kyle. It seems that in Ireland, the peasants often secure salmon and trout by crushing the spurge, *Euphorbia hiberna*, and throwing it into the streams, where it speedily exerts a most destructive action upon fishes. Dr. Kyle shows that the poisonous action is apparently due to tannic acid. Similar uses of poisonous plants are known to exist among the natives of many other countries. The other report is entitled, *The Biological Basis of Legislation Governing the Lobster Industry*, and is made to the Massachusetts commissioners of fisheries and game by Dr. G. W. Field. The chief defect in existing laws is in permitting the destruction of adult lobsters, and Dr. Field suggests the repeal of present laws and the substitution of a law protecting adult lobsters, but permitting the capture and sale of immature individuals, not under six inches in length. Although this is a radical departure from present laws, it has both a common-sense and a strictly biological basis, and might well be made the foundation for legislation throughout the lobster district.

Among the interesting discoveries in the systematic zoology of fishes may be mentioned the capture of a whale-shark (*Rhincodon typicus*) on the beach near

Ormond, Fla., January 25, 1902. This curious animal is very rare, and, as few specimens have been taken, its geographical distribution is entirely unsettled, but the Ormond specimen is the first ever taken on the Atlantic coast of America. The individual was 18 feet long and its skin is now in the National Museum. The first three parts of volume xxvi. of *Notes from the Leyden Museum* are concerned with the fresh-water fishes of Borneo, the account being based upon the collection made by a recent trans-Bornean expedition. The most important fact brought out is that the fresh-water fish fauna of Borneo differs essentially from that of Celebes, especially in the presence of carps and cat-fishes. Attention has recently been called to the discovery in New Zealand of a marine species of *Galaxias*, which is often regarded as an exclusively fresh-water genus, and the fact has brought to light the existence of published records of the occurrence in the ocean, for spawning, of at least one other species of the genus which normally inhabits fresh water. These facts help to explain the curious distribution of these fishes, which are characteristic of the fresh waters of New Zealand, South Australia, Tasmania, South Africa, and South America. Finally, an important paper, dealing with the life history of eels, has appeared from the pen of Prof. C. H. Eigenmann. It is called *The Solution of the Eel Question*, and not only summarizes previous knowledge but records the discovery of the larvæ of the common American eel. The larvæ were taken at the surface of the Gulf Stream in midsummer. Dr. Eigenmann regards the question of the possible breeding of eels in fresh water as still unsettled, but it is notable that no eggs or young have ever been taken either in Europe or America, except in the ocean.

FLAX. This fiber, once the most extensively used of any for clothing, has now largely given way to cotton, and the crop in the United States is grown principally for its seed, used in making linseed oil. The flaxseed crop in 1902 was a large one, 29,284,880 bushels, as compared with about 26,000,000 bushels in 1901. This was produced on 3,739,700 acres, principally in the Dakotas, Minnesota, and Kansas, North Dakota producing more than half of the total crop of seed. The season was quite favorable to the crop, but the price was low—\$1 to \$1.25 a bushel. The total value of the crop on the farm was \$30,814,661. The flaxseed crop in Manitoba was 582,228 bushels. The Russian crop was reported as almost a total failure; and that of Argentina was seriously injured by drought, the prospect at one time being for a crop of about 25,000,000 bushels, or one-third of the entire crop of the world. The yield as reported was 14,373,065 bushels, about a million bushels less than in 1901. In 1902 the imports of flax into the United States amounted to 7772 tons (valued at \$2,094,915), coming principally from the United Kingdom (1878 tons), Russia (2451 tons), Belgium (1682 tons), Canada (823 tons), and Netherlands (564 tons). The flax grown for seed produces an inferior fibre as a rule, but attempts are being made to breed varieties that will combine good fibre with large seed production.

In the past most of the flax straw has been burned to get rid of it. Efforts are now being made to utilize the coarse fibre of this straw, which amounts to thousands of tons in the Dakotas and Minnesota, for paper pulp and for textile purposes. During the past season satisfactory results were obtained with it in the manufacture of binding twine.

"Flax sickness," which affects soils where flax is grown continuously for several years, has been found by the North Dakota Experiment Station to be due to a fungus disease. This disease thoroughly infests the soil, and the plants die of wilt. The disease may also be spread by the seed. The obvious remedy is to rotate the crop with other crops, and carefully to select non-infected seed for planting. The growing of flax and wheat mixed has been tried with success on rich land. The wheat is drilled in in one direction across the field, and the flax at right angles to it. The North Dakota Station has found that the two crops can be grown together profitably on rich land, the flax tending to reduce the growth of the wheat, causing the kernels to fill better; the flax also uses the surplus water, and acts as a support for the grain, preventing it from lodging.

FLINT. See MINERAL PRODUCTION.

FLORIDA, the southernmost State of the United States, has an area of 56,680 square miles. Florida was organized as a Territory March 30, 1822, and admitted as a State March 3, 1845. The capital is Tallahassee. The population in 1900 was 528,542; in June, 1902, as estimated by the government actuary, it was 557,000. The populations of the four largest cities in 1900 were: Jacksonville, 28,429; Pensacola, 17,747; Key West, 17,114; and Tampa, 15,839.

Finance.—The total receipts of the treasury during the year 1902 were \$2,263,977.12. The balance on hand December 31, 1902, was \$1,092,458.26. The principal funds for which collections and disbursements were made, are the general revenue fund and the Indian war claims fund. The bonded debt of the State, at the end

of the calendar year 1902, consisted of \$764,800 6 per cent. bonds and \$267,700 3 per cent. consolidated manuscript bonds, making the total indebtedness of the State \$1,032,500.

Agriculture and Industries.—The two leading crops, corn and cotton, were better in 1902 than in 1901, though still slightly below the ten-year average. According to the *Crop Reporter*, the year's average of lint cotton was 120 pounds per acre. Corn, which had by far the largest acreage of any crop (602,400 acres) yielded a total of 5,180,640 bushels, with a value of \$3,989,093. The 31,949 acres of oats yielded 434,506 bushels, valued at \$265,049. Rice, which had an acreage of less than 6000 acres, yielded 27 bushels per acre—about 95 per cent. of the normal crop for the State. Sweet potatoes yielded 113 bushels per acre against a 10-year average of 101. The tobacco fields were more than ordinarily productive—3079 acres produced a total of 1,601,080 pounds of tobacco, valued at \$480,324. The yield of sugar-cane is estimated at 75 per cent. of a full crop. The orange orchards, which had been the State's principal source of income before the frosts of 1895 and 1899, were beginning to revive in 1902; 750,000 boxes were picked in that year—over three times the yield shown in the census for 1899. The statistics of the Department of Agriculture for January 1, 1903, showed there were in the State 44,695 horses, 626,345 cattle, 99,067 sheep, and 395,528 swine. The only important mineral of the State is phosphate rock. The output in 1901 was 751,996 long tons, an increase of more than 100,000 tons over the year preceding. Florida produced more than all the other States together.

Railroads.—In the report of the Railroad Commission of the State of Florida for the year ending June 30, 1901, the total number of miles of railway in operation was stated at 3,466.45 miles, of which 2,774.35 were main track. The nineteen roads reporting to the commission had a trackage of 3,026.44 miles, represented by an outstanding capital stock of \$35,328,728.17 and an outstanding bonded debt of \$35,001,472.88, making an aggregate capitalization of \$70,330,201.05, or \$23,238.59 per mile of road. The total gross earnings of the roads reported were for the year mentioned \$9,179,133.85, of which \$3,203,376.98 were passenger earnings, \$5,595,338.89 were freight earnings, and \$380,417.98 were from other sources. The amount expended during the year for maintenance of way and structures was \$1,780,815.33; for maintenance of equipment, \$1,245,029.68; for conducting transportation, \$3,551,028.85; for general expenses, \$368,422.46—making a total for operating expenses of \$6,915,296.32. The nineteen roads reporting carried 4,864,848 tons of freight an average distance of 94.28 miles at an average cost of \$1.17 per ton mile. Freight earnings per mile of road were \$1,854.44 and per train mile \$1061. The number of passengers carried during the year was 2,001,092, and the average distance traveled by each passenger was 44.99 miles. The passenger earnings per mile of road were \$1,081.63, and per train-mile \$1022. The total net earnings from operation for 1900 were \$1,916,599.44, and the net earnings for 1901 were \$2,263,837.54. The total number of employees in 1901 was 17,935; the total assessed valuation of all railroads in Florida, both those reporting and those not reporting, was: Main track, \$16,995,715; branch and switch tracks, \$720,192.74; rolling stock, \$2,507,791.42, making a total valuation of \$19,323,699.16, upon which were paid taxes to the amount of \$357,076.67.

Early in January, 1902, the Florida East Coast Drainage and Sugar Company was formed to reclaim the Everglades and utilize them for sugar plantations.

Elections.—At the regular biennial State election, held in November, 1902, the officers voted for were secretary of state, justice of the supreme court, comptroller, and railway commissioners. No Republican ticket was put in the field. The Democratic candidates were elected by votes varying from 15,215 to 16,215. The State legislature of 1903 will be composed of 32 Democrats in the senate, and 67 Democrats and one Republican in the house.

State Officers.—For 1902 and 1903: Governor, William S. Jennings, for four years, term ending January, 1905; secretary of state, H. C. Crawford; treasurer, James B. Whitfield; comptroller, A. C. Croom; attorney-general, William B. Lamar; superintendent of public instruction, W. N. Sheats; commissioner of agriculture, B. E. McLin; commissioners of railroads, R. H. Burr, J. B. Browne, J. L. Morgan—all Democrats. Supreme Court: Chief Justice, R. F. Taylor; associate justices, W. A. Hocker, F. B. Carter, E. C. Maxwell, T. M. Shackelford, and R. S. Cockrell—all Democrats. For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

FLUORSPAR. See MINERAL PRODUCTION.

FLYING MACHINES. See AERIAL NAVIGATION.

FOOD. The employment of artificial preservatives in food continued to excite a great deal of interest during 1902, and investigations were carried on in the United States, England, Germany, and Russia. Boric acid and borax attracted most atten-

tion, and the opinions of different students of the food question were not always agreed as to whether or not their use is harmful. Vaughan and Veenboer, after reviewing the results of previous investigations and experimenting themselves, conclude that the use of boric acid or borax in butter and cream, in amounts not exceeding one-quarter of 1 per cent. in the latter and one-half of 1 per cent. in the former, as recommended by the English commission in 1901, is not harmful and is fully justified. The dusting of hams and bacon with borax or boric acid in quantity not exceeding $1\frac{1}{2}$ per cent. of the weight of the meat is also unobjectionable and effective, since meat thus treated does not become slimy, and the growth of micro-organisms is prevented. In the United States the effects of repeated small doses of boric acid and other food preservatives, as well as of coloring matters and adulterants in general, on the human system, are to be the subject of government experiment under the direction of the Department of Agriculture at Washington, a number of healthy but impecunious individuals having been secured for the purpose. Dr. Willis G. Tucker of the New York State department of health says, in a paper read before the conference of sanitary officers, October, 1902, that among the substances which have been employed during recent years for the preservation of food are boric acid and borax, salicylic acid, sodium salicylate, benzoic acid, sodium benzoate, sulphurous acid, and the sulphites of sodium, potassium, and calcium, betanaphthol, formaldehyde, saccharine, the alkaline fluorides, and borofluorides and silico-fluorides, pyroligneous acid and asaprol. Some of these substances have well-recognized uses in medicine, and some of them are distinctly poisonous. There is little question but that if added in any considerable quantity to food they are dangerous. The question, however, is a very complex one and has to be considered with reference to the quantity of the particular food consumed, the nature of the food and manner of its use, and the effects likely to be observed in adults, invalids, and children. Experimenters in the city laboratory of Lodz, Russia, found saccharine in 50 per cent. of 71 samples of syrup; injurious substances in 43 per cent. of as many samples of confectionery; aniline dyes and salicylic acid in 7 out of 9 samples of marmalade; and dirt, flies, moulds and hair in 4 out of 6 samples of cake. Of 34 samples of milk, 14 contained dirty water, soda, and pathogenic organisms; of 6 samples of sour cream, 2 contained milk, flour, dirt, moulds, and putrefactive bacteria. Ptomaines were detected in bologna sausage, and various adulterations were discovered in vinegar, beer, soda water, sugar, and other foods.

FOOTBALL, the first of college sports and reaching its greatest development among the colleges, enjoyed in 1902 the most successful season in the history of the American game. A partial reversion to the old-fashioned straight game with plenty of kicking, as distinguished from complicated trick plays and heavy mass formations, increased the interest of spectators and diminished the number of accidents to players. What changes there were in the rules concerned only minor details of play and were without effect on the general character of the game. But the season was not without its lessons, the chief of which was the demonstration of the superior value of the open game and the necessity for such legislation as would make it the distinguishing style of play rather than the optional exception. Of the eastern teams Yale was the undisputed champion, gaining this place by defeating Harvard, 23-0; and Princeton, 12-5. She also defeated Amherst, 23-0; Wesleyan, 35-0; Brown, 10-0; Bowdoin, 17-6; and tied with West Point at 6-6. Her team was a steady, consistent unit rather than a collection of stars. Between Harvard and Princeton the only basis of comparison is the contests of each with Yale, and Harvard, though beaten by a larger score, is generally conceded second place for her season's work and the fact that the Yale team of that game was in far better condition than at the Princeton game of a week before. Harvard was defeated because her defense was too slow for the aggressiveness of the Yale attack. During the season she won from Brown, 6-0; Williams, 11-0; Amherst, 6-0; West Point, 14-6; Carlisle Indians, 23-0; Pennsylvania, 11-0; and Dartmouth, 16-6. Princeton had the best kicker in the country in De Witt and a good line to hold for him, and with better backs would have beaten Yale. Some of her other games were with Swarthmore, 18-0; Lehigh, 23-0; Annapolis, 11-0; Columbia, 22-0; and Cornell, 10-0. Two features of the season were the disappointing work of Pennsylvania and Columbia and the maintenance of the rapid rise made by such teams as Cornell, West Point, Brown, and Dartmouth, which must now be reckoned with in deciding the so-called "championship." Cornell defeated Rochester, 31-0; Union, 43-0; Williams, 37-6; Lafayette, 28-0; and lost to Carlisle, 10-6; Princeton, 10-0; and Pennsylvania, 12-11. West Point, in addition to tying Yale and scoring against Harvard, defeated Williams, 28-0; Dickinson, 11-0; Syracuse, 46-0; and Annapolis, 22-8. Carlisle, besides winning from Cornell and losing to Harvard, defeated Pennsylvania, 5-0; and was in turn beaten by Bucknell, 16-0; and Michigan, 60-0. Pennsylvania, aside from games mentioned, defeated Lehigh, 12-0; Bucknell, 6-5; Columbia, 17-0; and lost to

Brown, 15—6; and Annapolis, 10—6. Some other important games were: Dartmouth, 12, Brown, 6; Amherst, 12, Dartmouth, 6; Amherst, 29, Columbia, 0; Columbia, 5, Buffalo, 0; Columbia, 5, Annapolis, 0; Columbia, 6, Syracuse, 6; Brown, 5, Wesleyan, 0; Wesleyan, 6, Amherst, 5; and Syracuse, 15, Amherst, 0.

In the west, the Michigan team was vastly superior to its nearest rival. It was a cause for great regret that distances forbade a series of games that would show her relative position with the eastern teams. By some it was considered the strongest team in the country, and by even the most conservative it was admitted to the first four. Some of her victories were: with Case School, 48—6; Indiana, 60—0; Notre Dame, 23—0; Wisconsin, 6—0; Iowa, 107—0; Chicago, 21—0; Oberlin, 63—0; and Minnesota, 23—6. Other western scores were: Chicago, 12, Northwestern, 0; Chicago, 11, Wisconsin, 0; Illinois, 29, Nebraska, 6; Minnesota, 17, Illinois, 5; Minnesota, 11, Wisconsin, 0. On the Pacific coast California defeated Leland Stanford in their annual game 16—0.

FORD, PAUL LEICESTER, an American historical writer and novelist, died in New York City, May 8, 1902. He was born in Brooklyn, March 23, 1865, the son of Gordon L. Ford. Physical deformity kept him from active sports in youth and made him much of a recluse and student in his father's library, where, instead of at school, his education was acquired. His father provided him with a printer's outfit, and with his brother's aid he issued from his private press several works of a bibliographical character, dealing with early American history, and the lives of Hamilton and Franklin. Among these were the *Webster Genealogy*; a *Bibliography and Reference List of the History and Literature Relating to the Adoption of the Constitution*; *Bibliotheca Hamiltonia*; *Essays on the Constitution*; *Pamphlets on the Constitution*; lists of the official publications of the Continental Congress, and of the magazines published in the eighteenth century. He was also the editor of the standard edition of *Thomas Jefferson's Writings*. In 1896 he published *The True George Washington*, aiming to present the life of the man stripped of its accretion of false traditions. In 1899 he wrote another entertaining biography, *The Many-Sided Franklin*. It is in books like these that he has probably achieved a permanent place in American letters; although his popular success in such works of fiction as *The Honorable Peter Stirling* (1894); *Janice Meredith* (1899); and *The Story of an Untold Love* (1897) was large for the time. At the time of his death he was preparing editions of John Dickinson's *Political Writings* (of which one volume had appeared) and of Weems's *Life of Washington*, and was editor-in-chief of *The Bibliographer*. He was shot and killed by his brother Malcolm as a result of a long-standing difference over the division of their father's estate.

FOREIGN MISSIONS, AMERICAN BOARD OF COMMISSIONERS FOR. See AMERICAN BOARD OF COMMISSIONERS FOR FOREIGN MISSIONS.

FORESTRY. The interest in forestry in national, State, and private circles assumed an unusual activity during 1902, and with the reorganization of the forestry work of various departments the government can be said to have entered upon a definite forest policy. A number of the States have also made some progress along the same line. Private individuals in increasing numbers have sought to adopt systems of rational management for their holdings whereby steady incomes may be secured. One of the most notable proofs of the spread of forestry ideas is shown in the wide demand made upon national, State, and forestry school authorities for information regarding forests and the proper methods for their conservative exploitation. The importance of rational forestry is appreciated by the President, who by his messages and proclamations has shown his deep interest in the subject. The control and study of the national forest reserves continue to be divided among the General Land Office and Geological Survey of the Department of the Interior and the Bureau of Forestry of the Department of Agriculture. The desired legislation transferring the control of the reserves to the Department of Agriculture, although recommended by the secretaries of Agriculture and the Interior and endorsed by the President, failed of enactment. This division of the forestry work of the government is unsatisfactory and, as has been repeatedly pointed out, leads to much duplication and confusion.

Timber Resources and Production.—The twelfth census reports the timber resources of the United States, exclusive of Alaska and the island possessions, at 1,300,000,000,000 feet B. M. A second tabulation based upon mill estimates represents the available saw timber at 1,093,000,000,000 feet B. M. Oregon, California, and Washington in the order named contained the largest estimated amounts. The total cut of timber for the census year was 35,084,166,000 feet B. M., valued at \$566,832,984. To this should be added the value of forest products cut or produced on the farm, \$109,989,868, and turpentine, resin, etc., at \$20,344,880, making the total value for all forest products \$687,167,732. The year 1902 was a prosperous one for the lumber

trade in general. The productive capacity of the hardwood forests of the south has about kept pace with the diminished production in the north. The available data for the timber cut during the year are by no means complete, but Michigan, Wisconsin, and Minnesota, which are usually believed to produce one-fifth to one-fourth of the total of the country, cut 5,294,395,000 feet B. M. of white pine, 1,277,814,000 feet of hemlock, and 730,315,000 feet of hardwoods. The cut by the mills on the Pacific coast is said to have exceeded that of 1901, but no definite figures are given. The heavy increase in the Southern States has given rise to fears that the period of final exhaustion is not far off and has turned the minds of thinking men to the consideration of forest protection and management. In 1901 the domestic exports from the United States of unmanufactured wood were valued at \$39,398,594, and of manufactures of wood \$12,437,864—total \$51,836,458. In the same year the imports of unmanufactured wood were valued at \$22,050,952, and of manufactures of wood \$5,837,572.

Forestry in the Department of Agriculture.—Following the reorganization of the forestry work of this department and the creation of the Bureau of Forestry, rapid development has taken place and with its increased capacity and opportunities the value of its work is more highly appreciated. The bureau in 1902 had 162 men in the field carrying on work in 42 States and Territories. Applications for assistance in the management of private forest tracts continue to be made, the total requests at the end of 1902 covering 4,709,120 acres. Working plans are complete or nearly so for seven large tracts of forest representing 421,000 acres, and preliminary inspections have been made of 1,620,000 acres, and working plans for six tracts, one embracing 1,250,000 acres, are in course of preparation. Studies were made in the Prescott, Priest River, and Big Horn forest reserves preliminary to the preparation of forest working plans for the national reserves. This work was undertaken at the request of the secretary of the Interior. The bureau has also undertaken for the secretary of War the preparation of working plans for 8 military reservations embracing 117,468 acres. In the Division of Forest Investigations studies have been pursued on the silvicultural value of some 20 species of commercial forest trees. Special studies were begun on the big trees of California and of the swamp lands in eastern Arkansas and Missouri. The study of forest distribution has been begun in 8 or 10 States and the effect of grazing on the forest in a number of western States. The effect of forest fires on future reproduction of forests is also being given consideration. The production of turpentine has been under investigation and a method devised whereby a great saving can be effected. The cooperation of the bureau in tree planting has been sought as earnestly as in forest management. Up to June 30, 1902, there had been prepared 224 planting plans covering 6474 acres, in 29 States and Territories. Studies were continued on the natural extension of forests and preparations begun in the planting of the two new reserves in Nebraska. There were established two new divisions on July 1, 1902, the Division of Forest Extension and the Division of Forest Products. The appropriation for the year ending June 30 was \$291,860.

Forestry in the Department of the Interior.—As previously stated the work in forestry of this department is divided into the administrative under the General Land Office, and the surveying and mapping of the reserves under the Geological Survey. The reorganization of the administrative functions begun in 1901 was continued in 1902, and the section of the General Land Office devoted to forestry was raised to a division and given enlarged powers and a more efficient organization. As now organized the field force consists of several rangers for each reserve, one or more supervisors for each reserve, superintendents having jurisdiction over several reserves, and an inspector over all. The duties and powers of each of these officers are indicated by their titles and are fully described in a manual that has been issued for their guidance. The value of this system has been already demonstrated in the discovery and extinguishing of many incipient forest fires, in preventing trespassing, and in checking the unlawful cutting of timber. During 1902 the sales of timber from forest reserves amounted to \$25,483.87, the free use of timber granted was valued at over \$10,000, and grazing privileges at \$100,000. Fines, judgments, and claims for timber depredations were settled to the amount of \$284,078.85, and suits are pending for the recovery of \$2,970,151.10, the value of timber alleged to have been illegally cut. Since the close of the fiscal year ending June 30, 1901, a number of changes have been made in the forest reserves already established, and 13 new ones created by presidential proclamation, the total increase being 13,705,556 acres. The new reserves are: Santa Rita, Santa Catalina, Mt. Graham, and Chiricahua forest reserves in Arizona; Santa Isabella forest reserve in Colorado; Niobrara and Dismal River forest reserves in Nebraska; Medicine Bow forest reserve in Wyoming; Lincoln forest reserve in New Mexico; Little Belt Mountain, Madison, and Absaroka forest reserves in Montana; and the Alexander Archipelago forest reserve in Alaska. There were in all at the end of 1902 54

forest reserves set aside by presidential proclamation which embraced 60,175,765 acres. Withdrawals of 19 additional tracts have been made or are pending and as soon as examined the tracts temporarily withdrawn from entry that are deemed suitable will be proclaimed as new reserves or additions to those already established and the remainder opened for entry, sale, or other disposal. Under authority from Congress the secretaries of the Interior and of Agriculture caused an investigation to be made of a portion of the southern Appalachian system and they recommend the establishment of a forest reserve of approximately 10,000,000 acres. The legislation requisite to consummate this project is still pending.

Forest Fires.—Within the forest reserves the loss from forest fires in 1902 was less than for several years, the burned-over area being 87,799 acres, as compared with 126,223 acres in 1901 and 158,607 acres in 1900. Outside of the forest reserves the year 1902 was one of numerous and extensive forest fires, some of which were accompanied by loss of life. There was not a month in which losses amounting to thousands of dollars were not reported, the total for the year amounting to about \$25,000,000. The most severe losses were in June and August. During the latter month parts of Oregon and Washington were swept by fire causing financial losses amounting to nearly \$15,000,000, while at least a score of persons lost their lives. It has been estimated that the timber destroyed in Washington would have supplied for four years all the mills of the State running at full capacity. In seeking causes for these fires it has been found that they were due in most cases to one of three agencies, sparks from locomotives, carelessness with fire in clearing land, or abandoned camp fires. In Pennsylvania a number of convictions were secured for violations of the law relating to camp fires. The attention of the legislatures of a number of States has been called to these sources of loss and enactments are requested to prevent their future occurrence.

Forestry in the Philippines.—During 1902 the Insular Bureau of Forestry has reported substantial progress in the Philippine Islands. The working force was considerably augmented and divisions of inspection, forest management and forest botany were established. The forest regulations already established were found satisfactory in the main. It is now thought that instead of annual licenses, provision should be made for special licenses that should run for a longer term. These would justify the installation of plants capable of operating on a scale that is now impracticable. At present no lumberman is allowed to cut more than 100,000 cubic feet of timber, an amount too small to warrant large expenditures for exploitation. Under the present conditions even when lumbering only the superior classes of timber the expense is so great as almost to prohibit timber cutting more than five miles from navigable waters. In spite of the activity in lumbering, Manila continues to absorb practically all the timber brought to market, and the price of all grades of construction timber has increased 50 and in some cases 100 per cent. In his last report the forester says that the time for the exploitation of timber to other than Asiatic ports is a long way off, except perhaps for some of the finer cabinet woods. The forest area of the Philippines is now estimated to be 48,112,920 acres, of which less than 1,000,000 acres are held by valid private titles. Recent investigations have shown the existence of large numbers of gutta percha and rubber trees, but the wasteful clandestine trade if not checked will soon result in their destruction. A government monopoly in these products has been suggested as a means of preventing the destruction of the trees, operations to be conducted scientifically. The revenue of the Forest Bureau for the year 1902 was \$348,073.08 (Mexican), the average charge being about 6 cents per cubic foot or from 5 to 10 per cent. of the market value of the timber. The imports of timber into the Philippines for the year ending June 30, 1902, were 1,761,425 cubic feet, of which 1,033,751 came from the United States. At the request of President Roosevelt and the Philippine Commission, the chief of the Bureau of Forestry of the United States Department of Agriculture visited the islands during 1902, and with a few minor changes in detail the general policy of management is said to have been approved.

State Forestry, etc.—Connecticut, Kansas, Maine, New Hampshire, Maryland, Michigan, Minnesota, New Jersey, New York, North Carolina, North Dakota, Oregon, Pennsylvania, West Virginia, and Wisconsin continue to carry on the work of State forestry, although New York and Pennsylvania are the only ones making anything like adequate provision for its support. In Ohio, Colorado, and California the work has been nearly abandoned on account of a lack of funds, although these were among the first States to begin forest work. Indiana has a forest commissioner, but the appropriations have not been sufficient to accomplish much. He recommends provision for a State park and for extending the work along various lines. In Pennsylvania 40,000 acres in 1902 were added to the State forest reserves, which now embrace 325,700 acres. In New York the trouble over the management of the State reserves by the State Forest School was adjusted and reforestation was

begun. In Minnesota the efforts for a reserve about the headwaters of the Mississippi River were continued and provision was made for its establishment under terms to be laid down by the secretary of Agriculture. Progress is reported in securing and managing land granted or reverted to the State under the law of 1899. As a result of the destructive forest fires in Washington during 1902, it is said that two-thirds of the legislature favor the adoption of some system of management so as to avert similar losses in the future. At Hartford, Conn., the planting of various species of forest trees about the watershed has been begun. Similar work is being carried on at Woonsocket and Clinton, Mass. The Illinois Central Railway has begun tree planting along its right of way between Chicago and New Orleans, and the contract is let for planting 200,000 hardy catalpa trees. Experiments in Kansas and elsewhere show that this tree is of rapid growth and well adapted to the production of railroad ties of excellent quality. The Fort Worth and Denver Railway has begun similar efforts in northwestern Texas.

Forestry Associations, Schools, etc.—The summer meeting of the American Forestry Association was held at Lansing, Mich., August 27-28, 1902, and the winter meeting at Washington, D. C., December 10, when an adjournment was made until December 31, so as to meet with the American Association for the Advancement of Science. The old officers were re-elected. The annual meeting of the Canadian Forestry Association was held at Ottawa, March 6-7, 1902. The Iowa Park and Forestry Association met at Des Moines, December 8-9, and the Tennessee forestry meetings were held at Monteagle, July 21, and at Knoxville, November 12. In 1902 a society for the protection of forests was organized in New Hampshire and a forestry and water storage association in New York, and a State forestry association was organized at Cheyenne, Wyo. Other societies, particularly those of Massachusetts, California, and Michigan, were active in seeking to improve the forest conditions of their States. The increased interest in forestry is shown by the large enrollment at the schools of forestry. The New York State College of Forestry matriculated 70 students, the Yale Forestry School 40, and Biltmore 18. These institutions maintain summer schools, most of the time being spent in the woods. The universities of Michigan and Nebraska and the agricultural colleges of Indiana, Iowa, Kansas, Michigan, Minnesota, New Hampshire, North Dakota, Ohio, South Dakota, and Tennessee are offering courses in forestry, and the University of California contemplates the establishment of a school of forestry. A new forestry journal, the *Forest Quarterly*, made its appearance in 1902 from the New York College of Forestry. Among the deaths of men prominent in forestry was that of Hon. J. Sterling Morton (*q.v.*), former secretary of Agriculture and president of the American Forestry Association.

FORMOSA, an island in the Pacific Ocean 100 miles off the China coast and 250 miles north of the Philippines, is a Japanese possession. It has an area of 13,458 square miles and a population (1899) of 2,758,041, the greater part of which is Chinese. The Japanese population numbers 33,120, and the primitive Malayan aborigines living in the interior of the island are estimated at 100,000. The seat of government is at Taipei, on the northwest coast, other places of importance being Tainan, Tamsui, and Auping. Its control by Japan, to which country the island was ceded by China as a result of the war of 1894, is exercised through a governor-general (Baron Kodama since 1898). Under him there is a civil governor, whose powers extend to the districts in which civil rule has been established. The interior is still largely under military control, the imperial troops in 1901 numbering 16,387. The island is divided into six administrative districts, and the Pescadores, a small group of islands off the western coast, are also under the control of the Formosan government. Thanks to the able administration of Governor Kodama the island is enjoying great financial and commercial prosperity. The revenue is increasing rapidly and the actual receipts have surpassed the budget estimates. In 1897 the actual revenue amounted to little more than 5,000,000 yen. In 1900 the budget estimates placed the receipts at 9,510,000 yen and the actual revenue reached a total of 15,200,000 yen. The budget for 1901-02 placed the receipts at 20,894,641 yen and the expenditure at 20,852,441 yen. The government monopolies of opium, salt, and camphor yield an annual revenue of about 9,000,000 yen and a subsidy is received from the imperial government. (The yen is worth 49.8 cents.) Foreign commerce is increasing, the imports amounting in 1900 to 10,571,285 yen and the exports to 13,570,664 yen. The trade is largely with China, Great Britain, the United States, and British India. The chief products are camphor, of which Formosa furnishes the greater part of the world's product, tea, rice, sugar, hemp, flax, indigo, silk, opium, and cattle. The gold product amounts to over 1,000,000 yen annually. Extensive harbor improvements have been undertaken, and a trunk-line railway to extend over the entire length of the island is under construction; two sections of it, connecting Takow and Kelung, and Tainan and Taipei, have been completed and are in operation.

FOSTER, REBECCA SALOME, known in New York City as the "Tombs Angel," died in that city, February 22, 1902. Of her private life the public knew almost nothing except that she was the widow of Gen. John A. Foster, a Civil War veteran, and had lived in New York City for about 15 years previous to her death. Her charitable work extended over many quarters of the city, but her special ministrings were to the women in the Tombs prison, whose acknowledgment of her many acts of kindness was the sobriquet by which they always spoke of her. With a personality that seldom failed to win confidence she performed an immeasurable service to the city's social system in reforming waywardness and allaying distress, and so accurate were her judgments that she was often consulted by lawyers and judges in cases involving her charges. She lost her life in a fire at the Park Avenue Hotel. Her funeral services were made the occasion for expressions of appreciation by prominent public officials.

FOWLER, JOSEPH SMITH, ex-senator from Tennessee, died April 1, 1902, at Georgetown, D. C. He was born August 31, 1820, in Steubenville, O., and was educated at Franklin College, where he was afterward professor of mathematics for four years. After studying law he settled in Tennessee and became president of Howard Female College at Gallatin. In 1861 he removed to Illinois and remained until the occupation of Nashville by the Union troops, when he returned to Tennessee. He took an active part in reorganizing the State government in the interest of the Union, and was State comptroller under the administration of Andrew Johnson, a member of the Baltimore convention in 1864, a member of the constitutional convention of Tennessee in 1865, and was elected to the United States Senate by the legislature of that year. He was one of the seven Republicans who voted against the impeachment of Andrew Johnson. After 1871 he practiced law in Washington, D. C.

FRANCE, a republic of western Europe, lying between the Atlantic Ocean on the west and Germany on the east. The capital is Paris.

Area and Population.—The total area, including Corsica, is 204,092 square miles. The population, according to the census of 1901, was 38,961,945, which was an increase over the census of 1896 of somewhat less than 125,000 for the entire country. As the increase of Paris and its suburbs was slightly in excess of that figure, it is seen that the population of the rest of the country must have declined. An examination of the population figures for births, deaths, marriages and divorces for the years 1900 and 1901 shows somewhat of an improvement over the previous years, and it is hoped by sociologists and politicians alike that the improvement augurs well for the future. According to these figures, made public in 1902, the deaths declined from 853,000 in 1900 to 784,000 in 1901, and the births increased from 827,000 in 1900 to 857,000 during 1901. This was a higher record of births, and a lower record of deaths than for any year since 1897. Brittany and French Flanders showed the greatest increase of births over deaths, while the department of the Seine (Paris and its suburbs) showed 79,000 births to 73,000 deaths. Marriages in 1901 increased to 303,000 as compared with 299,000 in 1900. Divorces on the other hand increased from 7157 to 7741, the largest number since the revival of the divorce law. The populations of the largest cities in France in 1901 were Paris, 2,660,559; Marseilles, 494,769; Lyons, 453,145; Bordeaux, 257,471; Lille, 215,451; and Toulouse, 147,696.

Government.—Since the overthrow of Napoleon III., in September, 1870, France has had a republican form of government. The present constitution, adopted originally in 1875, has been frequently amended. Under it the executive authority is vested in a president, and the legislative power in a parliament or assembly, consisting of two houses, a senate and a chamber of deputies. The members of the senate, 300 in number, are elected for a term of nine years by an electoral college in each department, composed of the deputies, members of the general council and of the council of the *arrondissements* and delegates from the municipal and communal councils. One-third of the members retire every three years. The chamber of deputies is composed of 584 members elected for four years by universal suffrage, one from each of the *arrondissements*, into which the departments are divided for electoral purposes. The two houses in joint session (the national assembly) elect the president, whose powers are in reality exercised by a cabinet of responsible heads of departments. For local administration the country is divided into 87 departments, each governed by an appointive prefect, and possessing a representative assembly known as the general council. The unit of municipal government is the commune, and over each is a mayor, who is elected by the communal council and exercises limited executive powers.

The president of the republic is M. Emile Loubet, elected February 18, 1899. The ministry of M. Waldeck-Rousseau, which was organized in June, 1899, and remained in office until after the election in 1902, was constituted as follows: Premier and minister of the interior. M. Waldeck-Rousseau; minister of finance,

M. Caillaux; for foreign affairs, M. Delcassé; war, General André; marine, M. de Lanessan; colonies, M. Decrais; public instruction and worship, M. Georges Leygues; justice, M. Monis; commerce, industry, posts and telegraphs, M. Millebrand; agriculture, M. Jean Dupuy; public works, M. Pierre Baudin.

Army.—The French army is recruited on the conscriptive system. All able-bodied male citizens between the ages of twenty and forty-five are liable for service either in the active army or the reserves, and substitution and enlistment for money are forbidden. The term of service is three years in the active army, ten years in the reserve, six years in the territorial army, and six years in the territorial reserve. The estimated peace strength of the army in 1902 was placed at 29,424 officers and 553,000 men for the home army, and 1615 officers and 25,727 for the colonial army. The reserve of the active army includes about 1,320,000 men, and the territorial army and reserve, 2,270,000 men. The total strength of the French army, with its various reserves and territorial forces, is estimated at 3,500,000 trained men on a war footing.

Navy.—The supreme direction of the French navy is intrusted to the minister of marine, who acts as chief of the civil cabinet which controls the administrative work. He is assisted by a chief of staff, who is a vice-admiral, and who has, as chief of the military cabinet, extensive powers in reference to construction, maintenance, commissioning, and mobilization of the fleet, and of all preparations for war. For administrative purposes the French coast is divided into five maritime *arrondissements*, each under control of a vice-admiral. The fleet is divided into the Mediterranean squadron, the Channel squadron, and the divisions of the Atlantic, Pacific, the Far East, Cochinchina, and the Indian Ocean. The naval expenditure of the French government in 1901 was 327,692,530 francs, and the budget estimates for 1902, 312,097,951 francs. The personnel of the navy in 1902 consisted of 59,875 officers and men. The navy is manned partly by conscription and partly by voluntary enlistment. The *Inscription Maritime* provides a naval reserve of 114,000 men. The term of service in the navy is the same as that in the army. In 1902 the strength of the French fleet was as follows: Battleships (first-class), 5, and 3 under construction; battleships (second-class), 7; battleships (third-class), 13; armored cruisers, 17, and 4 building; coast defense ships, 18; protected cruisers, 40; torpedo gunboats, 15; destroyers, 15, and 15 under construction; torpedo boats (all classes), 162, and 26 building and projected; submarines, 14, and 20 under construction. This constitutes in size and effectiveness the second fleet in the world, but both Germany and Russia are increasing their fleets at a much faster rate than France. See MANŒUVRES, MILITARY AND NAVAL.

Finance.—The ordinary revenue of France is derived principally from state monopolies and factories, and direct and indirect taxation. According to the amended budget for 1902 the revenues were placed at 3,604,561,268 francs and the expenditures at 3,604,415,197 francs. Of the various sources of revenue the indirect taxes contributed the largest amount, 2,139,698,600 francs. The principal items of expenditure were: Payments on public debt, 1,243,425,746 francs; war, 716,700,000 francs; marine, 312,097,951 francs; public works, 229,994,610 francs; and colonies, 120,598,455 francs. The budget estimates for 1903 as submitted to the Chamber on October 14, 1902, by the new finance minister, M. Rouvier, included proposals for the expenditure of 3,500,000,000 francs, with estimated receipts of 27,000,000 francs less. To meet the expected deficit M. Rouvier looked to the saving in interest resulting from the conversion of the $3\frac{1}{2}$ per cent. *rentes* into 3 per cents., which was effected in 1902, to the cessation of the redemption of National Savings Bank bonds, to the sum received from the Chinese indemnity, and the suspension of the annuity to school funds. On January 1, 1902, the public debt of France approximated 30,096,632,622 francs, of which 22,001,445,642 consisted of 3 and $3\frac{1}{2}$ per cent. *rentes*.

Agriculture and Industries.—The agricultural products of France constitute one of its greatest sources of wealth, over 70 per cent. of its area being under crop or grass. It is the largest wheat-growing country in Europe, the product of this grain amounting in 1901 to 301,327,988 bushels, and in 1902 being variously estimated at between 355,000,000 and 383,000,000 bushels. Other grains in order of importance are oats, rye, barley, and buckwheat. Potatoes (122,541,230 quintals in 1900), sugar and other beets, flax, hemp, tobacco, and grass and hay (160,743,459 quintals in 1900) are also important products. France leads the world in the production of wine, the output in 1901 amounting to 1,275,197,308 gallons. The production of cider in the same year reached 280,144,920 gallons. The silk industry gives employment (1900) to 136,214 persons; the production of cocoons being 9,180,404 kilogrammes. There are mines of coal, iron, copper, lead, silver, and antimony, the mining industry employing over 156,000 workers. The coal production in 1900 amounted to 32,721,562 metric tons, and the production of pig-iron to 2,714,298 metric tons. The total value of the product of all metalliferous mines in 1899 was 460,366,671 francs; of quarries, 243,428,986 francs. Of the manufacturing industries the textile factories are of the

greatest importance, but manufactories of chemicals, paper, leather goods, and jewelry are also numerous.

Commerce.—The imports of France, which consist largely of textiles and tissues, food-stuffs, machinery, metals and oils were valued in 1901 at 4,715,000,000 francs, against 4,698,000,000 francs in 1900; of these, raw products constituted the bulk of the value, amounting, in 1901, to 3,124,000,000 francs. The exports increased from 4,109,000,000 francs in 1900 to 4,166,000,000 francs in 1901. The values of the principal items of export in 1900 were as follows: Textiles, 659,700,000 francs (of which silks constituted a value of 258,100,000 francs; woollens, 227,200,000 francs; and cottons, 174,400,000 francs); wine, 227,900,000 francs; raw wool and yarn, 201,700,000 francs; small wares, 185,000,000 francs; linen and cloths, 136,100,000 francs; and raw silk and yarn, 135,700,000 francs. The subdivisions of exports in 1901 were food-stuffs, 778,000,000 francs; raw materials, 1,091,000,000 francs; and manufactured articles, 2,297,000,000 francs. The predominance of manufacturing in the industrial life of France is readily noticeable in the fact that while raw products constitute the bulk of the imports, manufactures make up the bulk of the exports. The countries furnishing the largest amount of imports in order of importance according to the value of the trade are: Great Britain, United States, Germany, Belgium, Argentina, Russia, and Spain. The order of importance of countries receiving exports is Great Britain, Belgium, Germany, United States, Switzerland, and Italy.

Communications.—The length of standard-gauge railways open for traffic on January 1, 1902, was 23,880 miles, which included a single state line of 1700 miles. The private lines were constructed almost entirely on concessions by the provisions of which the lines become government property in time. In addition to the standard gauge roads there are in operation 2970 miles of narrow gauge road and 2319 miles of tramways.

HISTORY.

The Spring Elections.—The last session of the old Chamber of Deputies was held on March 30, 1902, and immediately after adjournment the campaign for the election of the new chamber was opened. The principal party groups presenting candidates were divided primarily into supporters and opponents of the Waldeck-Rousseau ministry. The most important group among the supporters of the ministry were the Ministerial Republicans who had behind them the prestige of the leadership of M. Waldeck-Rousseau with the record of the longest premiership in French history, and the united support of the official office-holding body throughout the country. Also to be classed as Ministerialists were the Radical Republicans led by M. Brisson, M. Combes, and M. Bourgeois; the Ministerial Socialists under the lead of M. Jaurès and represented in the cabinet by M. Millerand, the minister of commerce; and the Radical Socialists. The opposition was composed of various groups bound together only by common hostility to the ministry. Of these anti-ministerial groups the best organized and most effective was that known as the anti-Ministerial Republicans, or Progressives, who look to former Premier Méline as their leader. With them also were aligned the Guedist Socialists (or Reds), whose ideal of government is the commune, the incongruous and disorganized factions known roughly as Nationalists, and the Reactionaries. The first balloting occurred on April 27, and the result showed second ballots to be necessary in 175 constituencies. The results in Paris augured ill for the success of the ministry, but the provincial ballotings were so overwhelmingly in favor of the Ministerial candidates as to assure a decisive government victory. Out of a total of 8,863,727 votes cast, the Ministerialists polled a total of 5,198,193 against a total of 3,352,895 cast by the opposition. To the Ministerial vote the various groups contributed as follows: Ministerial Republicans, 2,029,874; Radicals, 1,734,790; Radical Socialists, 715,690; and Ministerial Socialists, 717,839. The votes of the anti-Ministerial groups were made up as follows: Anti-Ministerial Republicans, 1,103,576; Nationalists, 1,160,621; Reactionaries, 943,960; and Guedist Socialists, 144,738. In Paris, where the vote was 20 per cent. heavier than at the preceding election, occurred the worst defeat ever sustained by the government in the metropolis. Not a single Ministerialist was returned, but instead 8 Nationalists, 6 anti-Ministerial Socialists, 5 anti-Ministerial Republicans, and 3 Reactionaries. Estimates based on pre-election pledges arranged the party affiliations in the new chamber about as follows: Ministerial Republicans, 111; anti-Ministerial, 99; Radical Republicans, 129; Radical Socialists, 90; Nationalists, 59; Reactionaries, 50; Ministerial Socialists, 43; and Guedist Socialists, 6. The total Ministerial majority after the second balloting was set at 88.

The New Ministry.—On May 20, 1902, it was announced that M. Waldeck-Rousseau, considering that his policy had been sustained by the country as a result of the election had determined to resign on the assembling of the new chamber. Moreover, it was said that he considered that his mission had been accomplished, and that he ought now to consider the state of his health, which was anything but good.

In some quarters it was suggested that he, being an aspirant for the presidency, did not care to risk losing the reputation that his unusually long and successful career as premier had brought him. On June 3 he formally tendered his resignation to the president. President Loubet on June 4 held a long consultation with M. Léon Bourgeois, the newly elected president of the Chamber, with the result that he called on M. Henri Brisson, the former premier and Radical Republican leader, and requested him to form a new cabinet. M. Brisson refused to attempt it himself, but suggested that the president call upon M. Combes, a leading Radical Republican senator. This advice President Loubet accepted, and on June 7 M. Combes announced his cabinet as follows: Premier, minister of the interior, and minister of public worship, M. Combes; justice, Senator Vallé; finance, M. Rouvier, one of the foremost of French financiers; foreign affairs, M. Delcassé, who held that portfolio in the Waldeck-Rousseau cabinet; marine, M. Maruéjouls, a deputy who was minister of commerce in the Brisson cabinet (1898); public instruction, Senator Chaumié; public works, M. Camille Pelletan, a deputy; colonies, M. Doumergue; war, General André, who held the same portfolio in the Waldeck-Rousseau ministry, but was prevailed upon to continue in the new cabinet until his proposed military reforms could be enacted; commerce, M. Trouillot, a deputy, formerly minister of colonies in the Brisson cabinet; agriculture, M. Mougeot. The new cabinet was considerably more Radical in its tendencies than that of M. Waldeck-Rousseau. Of its membership M. Pelletan and M. Doumergue represented the Radical-Socialists, M. Mougeot, the Radical Left, and Premier Combes and most of the other members, with the possible exception of M. Rouvier and General André, were looked upon as Radical Republicans.

The Opening of the New Chamber.—The new chamber assembled at Paris June 1, 1902. M. Paul Deschanel, who had presided over that body for the last four years, was the candidate of the Waldeck-Rousseau Republicans for the presidency. The Radical Republicans, however, who were successful in electing a larger number of deputies than any other Ministerial group, presented the name of M. Léon Bourgeois. The choice of president of the French Chamber, like that of the speaker of the British House of Commons, is supposed to be non-political, and the opposition seldom presents a candidate of its own. In the present instance, however, enough anti-Ministerial Republicans, who still feel bitter toward all of the Waldeck-Rousseau partisans, united forces with the Radicals and elected M. Bourgeois over M. Deschanel by a vote of 303 to 267. Two Radicals, M. Etienne and M. Maurice Faure, were elected vice-presidents. On June 10, M. Bourgeois assumed the chair in a speech in which he declared his intention of acting as an arbiter and not as a partisan. On the same day the new premier, M. Combes, delivered his first speech. He took occasion to laud the Waldeck-Rousseau policy of attempting to unite all factions of the Republican party and declared that he would follow it. He declared himself favorable to the Russian alliance, favored the reduction of the term of military service to two years, emphasized his desire to effect a radical reduction in national expenditures, and decried the attempts to confound the cause of the Catholic Church with that of the religious organizations aimed at by the Associations Act. Two days later came the first test of the new ministry's strength when a friendly interpellation of M. Brüssière, brought out a favorable vote of 329 to 124.

The Enforcement of the Associations Law.—The enforcement of the act passed in June, 1901, to curb the power and restrict the activities of the religious associations and congregations, whose strength had been manifested anew in the course of the Dreyfus case, and in the revival of the Nationalist movement succeeding it, was the principal event in the domestic history of France in 1902. During the early months of the year the impression gained ground that although the law had been placed on the statute books by the Waldeck-Rousseau ministry, the premier himself was not the man to insist on its enforcement to the letter. Radical Republicans, like M. Bourgeois, and Ministerial Socialists like M. Jaurès, showed their dissatisfaction, and made it clear that in their support of the ministerial measure they had in mind its enforcement in such a way as to secularize practically all the church schools. They purpose to destroy clerical influence. Such an outcome they realize will be very unlikely of fulfillment if the present large proportion of the students receive their education in Roman Catholic schools. Against the Jesuits, Assumptionists, Benedictines, and Carmelites the measure was enforced with considerable strictness in the early months of the year, with the result that many of them were driven from the country. In many cases, however, the attempt was made to evade the provisions of the law providing for the control and direction of the conventual schools by re-constituting them under secular auspices. This evasion could only be met by the slow process of the courts. With the resignation of Waldeck-Rousseau and the acceptance of the premiership by M. Combes, whose Radicalism has always run strongly in anti-clerical lines, a decided change occurred. In his opening address to the new Chamber in June, the new premier significantly declared that the act should be resolutely

and rigorously enforced, and his actions did not belie his words. On July 4 at the close of a fierce debate in which the ministerial policy had been bitterly attacked, the Chamber, by a large majority, voted approval of the determination of M. Combes to secure a definite victory for secular justice over monastic disobedience. On July 11, the day before the session ended, a tumultuous scene was precipitated by a vehement assault of M. Aynard on the ministry, which was answered by M. Combes in person. The latter was continuously interrupted by shouts of "à bas le ministre proscripteur," and quiet was restored only by the chamber official guards. Shortly after adjournment an official circular embodying M. Combes's ideas of enforcement was published. It was served upon 76 schools in Paris and over 2000 in the provinces, and ordered the closing of all unauthorized schools by the police unless closed by July 23. The Catholics, led by Cardinal Richard of Paris, protested vigorously but without avail. The ministerial orders were carried out, and all France was stirred and excited as a result. Even some supporters of the measure disapproved of M. Combes's harshness. In Paris, where the Nationalists, led by François Coppée and Jules Lemaitre, joined forces with the Clericals, the resistance assumed a political aspect, and was further complicated by a Socialist agitation that resulted in the storming of a monastic school in the Rue Furstenburg, and a clash between Socialist and Clerical mobs in the Latin Quarter. Coppée and other leaders were arrested. In Brittany, where the opposition was fiercest, it was fanatically religious. Having forced the submission of most of the conventual institutions the government turned its attention to those who had opposed the carrying out of its orders. First of these to suffer were army officers, who had been called upon by local authorities to assist them in closing the schools, but had refused. M. Combes declared in cabinet meeting that the army opposition was "plainly and violently royalist" and ordered several courts-martial of more prominent officials. At Lanouen Lieut-Col. de St. Rémy was tried by court-martial for refusal to obey a requisition of the prefect of Morbihan. He admitted his guilt, but declared that he had to choose between the judgment of a court and the judgment of the Lord. The court found him guilty, not of a refusal to obey a military order, but merely a civil requisition, and sentenced him to one day's imprisonment, but the cabinet, feeling that more strictness was demanded to make its policy effective, struck his name from the army list. Major Ladurie at Nancy, after having been practically exonerated by the court-martial, was likewise dismissed from the army by cabinet orders. The Radicals and Socialists were incensed at the leniency of the courts, which they declared involved a military revolt against civil authority, and M. Jaurès proposed the abolition of courts-martial as anomalies in a republic. The army, on the other hand, was irritated at the way the ministry by over-riding the court's verdict passed a censure on military justice. The Chamber, in October, sustained the ministerial measures by a vote of 329 to 233, and Premier Combes presented a bill empowering the government to repress attempts to re-open schools once closed—a point not covered by the original act. Church officials who had shown opposition to the enforcement of the act were punished during the fall months. Hundreds of priests were deprived of their stipends and the salaries of several bishops and of Cardinal Perraud of Autun were suppressed.

Labor Troubles.—During the autumn of 1902, France, like the United States, was the theatre of a coal strike of serious proportions. The strike had its beginnings in a futile attempt at a general strike started by the miners of Montceau in 1901 on their demand for an eight-hour day, for a two-franc per day pension after twenty-five years' service without limit as to age, and for a minimum wage. The miners in the departments of the North and Pas-de-Calais did not then accept the programme of the miners of Montceau with enthusiasm, and the strike fell through. Later in the year the government agreed upon a limited pension scheme and proposed a plan for the gradual reduction of the hours of labor. This did not satisfy the miners, however, and at a congress of miners at Alais in March, 1902, a general strike was determined upon. The actual declaration of the strike was not promulgated until September after a new congress at Commentry had favorably passed upon it, and drawn up a manifesto in which four demands were made. These were: (1) A pension of two francs per day after a period of thirty years' service, providing the worker was fifty years old; (2) an eight-hour day; (3) the establishment of a minimum wage; (4) a general advance in salaries. The first two demands the miners acknowledged had been satisfactorily arranged for the present and were not pushed. On the third the government and mining companies, however, were obdurate, and on the fourth—a matter which concerned only the companies—the employers declared that the low price of coal rendered an increase at the present time absolutely impossible. But it was for this concession that the miners were most insistent. The very different conditions governing the work in the coal fields in various parts of the country, made it evident very soon after the order for a general strike went into effect, that the various bodies of miners were not working in common, and that for lack of a single controlling spirit the attempt would be likely to fail, and that the struggle would

develop into a simple struggle between disconnected companies and their workers. This, in fact, was the result. Instead of the "great rising of the brotherhood of workers" which the labor leaders had counted on, the strike resolved itself into a series of disconnected disputes which were settled without common accord and in entirely different manners. On November 2, 1902, a conference was held between miners and representatives of some of the companies at which, after considerable discussion, the latter agreed to the miners' demand that the questions at issue be submitted to arbitration. Up to that time it was said that 100,000 miners were on strike, that much property had been destroyed, and that the cost of the strike had amounted to about 30,000,000 francs. In many districts troops had to be called out to preserve order. The Chamber of Deputies, by a formal vote, requested Premier Combes to intervene, and his influence is said to have been exerted in obtaining the consent of the companies to accept arbitration. Toward the middle of November the decisions of the arbitrators in the various districts began to be announced, and a storm of protest and reproach was raised by the strikers when it was found that almost without exception the findings were unfavorable to their contentions. At a miners' conference hurriedly called at Arras, it was voted to continue the strike, but in many districts the miners were already gladly returning to work. This act of refusing to accept the decision of the arbitration, which they had proposed, lost the miners much sympathy, and at a second miners' congress called at Lens, they rescinded the action of the Arras meeting and agreed to abide by the decisions of the arbitrators. By the first week in December, 1902, practically all the striking miners had returned to work. A strike of shipping and dock-laborers at Marseilles in December, 1902, which resulted in considerable disturbance, had not been settled by the end of the year.

Foreign Affairs.—Little of importance in the foreign relations of France that could be considered as a new departure occurred during 1902, but on the whole the position of the country in international politics can be said to have been considerably strengthened. Not in many years were the relations between France and Great Britain so cordial as during 1902, a fact especially exemplified in the growing sentiment, which found expression in high circles on both sides of the Channel, looking toward the negotiation of a permanent treaty for the arbitration of all existing and future disputes. Early in the year a satisfactory understanding was reached with Italy in regard to the rights of the two nations in the Mediterranean with particular reference to the occupation of Tripoli and Tunis. (See ITALY, paragraph Foreign Relations.) With Spain, too, the existing friendship was strengthened. The most important event in international politics in which France took a part consisted in the reaffirmation and restatement of the Franco-Russian alliance announced immediately after the promulgation of the Anglo-Japanese Treaty (February). In May the visit of President Loubet and M. Delcassé to St. Petersburg afforded an opportunity for the expression of friendship by both President and Czar. In September the Marquis de Montebello, the French ambassador, was dismissed from office, apparently because of favors shown by him to Gen. Louis Bonaparte, now an officer of the Russian army. The dismissal, however, had no bearing whatever on the relations of France and Russia. During the summer diplomatic relations were resumed with Venezuela.

For the Franco-Siamese Treaty, see SIAM; see also INTERNATIONAL RELATIONS; ARBITRATION, INTERNATIONAL; ROCHAMBEAU STATUE.

The Speeches of M. Pelletan.—Two speeches of M. Camille Pelletan, the new minister of public works, delivered in September, 1902, at Ajaccio, Corsica, and Bizerta, Tunis, attracted considerable attention in the international press, but seem to have been taken more seriously in France itself than anywhere else. At Ajaccio he talked about the need of fortifying Corsica as a link between France and her African protectorates and provinces, and as a bulwark against possible Italian attack. Then, crossing over to Africa, he spoke at Bizerta to the following effect: "We do not say we want to make the Mediterranean a French lake . . . but part of the Mediterranean is French and will always remain French. With this powerful rampart, so well situated both for defense and attack, and with Corsica and Tunis, we can hold the open door between the two halves of the Mediterranean in spite of Malta and Gibraltar." Coming from a member of the French ministry these utterances were undoubtedly indiscreet, and Paris was greatly excited lest Great Britain and Italy should take offence at them. Premier Combes, evidently looking at it in this light, took an early opportunity to declare publicly that the views expressed by M. Pelletan were in no way to be considered official or semi-official expressions of those entertained by the French government. The English and Italian press treated the affair as of little consequence, and the German papers called it "champagne talk."

The Conscription Bill.—One of the first measures brought forward by the Combes ministry was a bill introduced early in the year to reorganize the existing conscription system by a reduction of the term of active service required "with the colors" from three to two years. The term of service has been modified three times within the

past twenty years, and the present three-year system, adopted in 1889, has never been considered satisfactory from any point of view. In 1871 the annual contingent of conscripts was 293,000; under the existing arrangement it is 225,000. In Germany, on the other hand, the contingent increased from 330,000 in 1871, to 450,000 in 1901, a gain of 120,000 as compared with a loss in France of about 68,000. Moreover, under the present liberal system of dispensations, exemptions, and substitutions, about 65,000 of the annual conscription of 255,000 serve only one year, leaving two-thirds of the conscripts to do all the actual service. The bill introduced in parliament seeks to remedy this evil, and by reducing the time of service to two years and practically doing away with the system of exemptions, to make the entire system more uniform and effective. This, its advocates declare, would not mean a diminution in the actual force but a very substantial increase. The bill had the endorsement and support of General André, the minister of war, but was opposed by several eminent authorities on military affairs, including General de Galliffet, who asserted that while Germany could advantageously rely on a two-year term of service because of her high birth-rate, France could not. Counter proposals of various sorts were proposed by the opponents of the act, and the bill passed the Chamber, but by the end of the year had not received the Senate's assent.

Various Legislative Measures.—On March 18, 1902, the Chamber voted 298 to 237 that future chambers should last for six years instead of four. The ministry supported the measure. The innovation was looked upon as a most important one, as, if it received the assent of the Senate and became a law, it was expected that it would be likely to have the effect of increasing the eagerness of candidates, solidify the parties, and tempt the president to seek the dissolution of the Senate. It would also tend to economy by stopping the very common custom of deputies of bribing their constituencies with public works. The opponents of the measure declared it to be a high-handed usurpation of constitutional power on the Chamber's part, and when, in the Senate, the committee to which it had been referred agreed to oppose it, Premier Waldeck-Rousseau, while declaring that he favored the change, announced that discussion of it would be postponed for the present. M. Combes, himself a member of the Senate, upon assuming the premiership studiously neglected to take any notice of the measure whatever. In July, 1902, M. Rouvier, the new finance minister, introduced a bill that will have the effect of placing the entire funded debt of France on a 3 per cent. basis. The measure, which passed both houses with little opposition, provides for the conversion of all $3\frac{1}{2}$ per cent. *rentes* to 3 per cents. by a system of graduation, the conversion to become effective on November 1, 1902, when the reduction from $3\frac{1}{2}$ per cent. to $3\frac{1}{4}$ per cent. was to be made, to be finally reduced to 3 per cent. four years from that date. The conversion, it was estimated, would result in a saving of over 30,000,000 francs a year. Other legislation of importance passed during 1902 were an act providing for an expenditure of 600,000,000 francs for public works, largely canal and river and harbor improvements, and an act providing for a system of bounties to French shipping, and extending the application to foreign-built ships owned in France. In December the Chamber passed the sugar duty bill and ratified, without a division, the Brussels Sugar Convention.

Other Affairs.—In January, 1902, a change in the method of management of the Comédie Française was announced. Hitherto the theatre has been governed like a miniature republic, and has received a regular annual subvention from the government. The control and the choice of plays have been vested in a committee of actors and actresses, who participated in the profits. Early in the year, the minister of public instruction, under whose supreme control the theatre has been placed, issued an order abolishing the governing committee, and placing the selection of the plays in the hands of the administrator. In August an important new administrative department was created consisting of a consulting committee for the defense of the colonies under the joint supervision of the ministries of war, colonies, and marine. It is to be composed of three major-generals from the colonial corps, one major-general of the army general staff, one rear-admiral from the naval general staff, the war office head of the bureau of colonial troops, and the chief of the military bureau of the colonial office.

On September 18, 1902, it was announced at Washington that the governments of France and the United States had agreed to extend for one year, from September 24, the time limit for the ratification of the commercial reciprocity convention negotiated and signed on July 27, 1899.

FRANCIS, DAVID ROWLAND, president of the Louisiana Purchase Exposition, was prominent in 1902 for his energetic and successful work in making the exposition ready for its opening in 1904. Mr. Francis was born near Richmond, Ky., October 1, 1850, and graduating from Washington University, St. Louis, in 1870, he entered business and has at present large interests in various corporations in the city, of which he was mayor from 1885 to 1889. From 1896 to 1897 he was secretary of the Interior. He was elected president of the Louisiana Purchase Exposition by a con-

vention of delegates from the various States and Territories formed from the purchase of 1803, which assembled in St. Louis on January 10, 1899. Mr. Francis has adopted all usual and many unusual forms of press advertising to arouse in the people of the country a great enthusiasm for the exposition and in its interest visited many cities in this country and abroad for the purpose of personally soliciting exhibits.

FRATERNAL ORGANIZATIONS, a title applied to those secret societies which maintain a death, sickness, or accident fund for their members. Many of these societies are under the surveillance of the State insurance departments, which exact from the governing bodies such statistical information as tends to check betrayal of trust. The following are among the principal organizations of this kind in the United States:

	Date of Founda- tion.	Membership.	Benefits Dis- bursed Since Organization

FREE BAPTIST YOUNG PEOPLE, UNITED SOCIETY OF, an international organization, comprising all the young people's societies in the Free Baptist denomination, established in 1888. It has (1902) a total membership approximating 23,000, included in 450 young people's societies, 150 junior societies, and 5 intermediate societies. In the past year some 50 new societies were formed; about \$3000 was contributed for foreign missions, besides various amounts for the work at home. President, E. P. Metcalf, Providence, R. I.; general secretary, Harry S. Myers, Hillsdale, Mich.

FREEMASONS, represented by fifty-seven grand lodges in the United States and British America, had a membership of 901,968 in 1902. After deducting suspensions, withdrawals, etc., this is a gain over 1901 of 24,206. These grand lodges are in affiliation with the English grand lodge, of which the Duke of Connaught is grand master, and the grand lodges of Ireland, Scotland, and a number of other countries. They are not affiliated with the Grand Orient of France. Freemasons are under the ban of the church in Roman Catholic countries.

FREE METHODIST CHURCH was established in 1860. It now has 1041 ministers and 29,795 communicants in the United States, Canada, and foreign fields, more than 28,000 being in the United States. There are 1067 churches with property valued at \$1,257,060, exclusive of 522 parsonages valued at \$372,125. The denomination conducts foreign missionary work in Africa, India, and Japan, the mission churches numbering 8, with 348 adherents, 288 of whom are communicants. Twenty-one out-stations are maintained, employing 23 missionaries besides a number of

native workers. Educational property valued at \$100,000 is held by the college and six seminaries under the auspices of the church. The denominational headquarters are in Chicago, Ill., the location of the publishing house.

FRENCH CENTRAL AFRICA includes the three native states of Wadai, Kanem, and Bagirmi, which by the Anglo-French treaty of March 21, 1899, were recognized as being within the French sphere of influence. The areas and populations are not definitely known, but the following estimates have been made: Wadai, 150,000 square miles and 1,000,000 inhabitants; Kanem, 30,000 and 100,000; Bagirmi, 65,000 and 1,000,000. The people are mostly Mohammedans. A French resident is stationed at Massenia, the capital of Bagirmi. In March, 1902, it was reported that a revolution had taken place in Wadai, the strongest native state in this part of Africa, the Sultan Ahmed, overthrown after a fierce battle, being succeeded by Mohammed Dudu, son of the Sultan Yusef. For the Senussi movement, see **FRENCH SOUDAN**.

FRENCH CONGO, a colony of France in West Africa, extends from the coast, between Rio Muni (Spanish) and Cameroon on the north and west and the Congo Free State on the south and east, to Wadai (one of the central African states in the French sphere) and the Egyptian Soudan. The area is estimated at upwards of 450,000 square miles and the population at from 8,000,000 to 15,000,000. The colony, which is administered by a commissioner-general resident at Libreville, is one of the least developed of the West African dependencies and requires an annual subsidy from France. In 1900 the imports were valued at 10,555,000 francs (4,879,000 francs from France and French colonies), and the exports 7,540,000 francs (2,610,000 francs to France and French colonies). The franc is worth 19.3 cents. Of the exports, rubber amounted to 3,018,000 francs, ivory 2,927,700, and various woods 1,150,000.

In July, 1902, the French minister for the colonies abolished the post of government commissioner in the region of Lake Tchad and placed the territory as a province under the administration of the French Congo. Considerable trouble arose in 1902 on account of the determination of the French to enforce certain regulations that had been recently adopted, practically closing the colony to all but French trade. Certain British traders, who for years had carried on a large part of the Congo commerce, were forbidden to pay more than a fixed price for native products, while the natives were ordered to sell their produce to certain concessionaires to whom the French authorities had made over large tracts of land. For violation of the law excessive fines were imposed upon the English merchants, who through the Liverpool chamber of commerce addressed a protest to Lord Lansdowne, the British secretary of state for foreign affairs, asking intervention. On account of the new law trouble recurred in the summer of 1902 with the natives in the Ngounie district. The French destroyed seventeen towns and a number of plantations. In November it was stated that trade was in a very bad condition and the revenue declining, while the people were discontented, in marked contrast with the French West African colonies that have a practically free-trade system.

FRENCH GUIANA, a colony of France on the northern coast of South America, has an estimated area of about 30,500 square miles, and a population, including about 7000 convicts and *relégués*, estimated at about 30,300. The capital and only seaport is Cayenne. The colony is administered by a governor and is represented in the French chamber by one deputy. The local budget for 1901 balanced at 2,692,818 francs, while a subvention provided in the French budget for 1902 amounted to 7,086,000 francs, of which 5,887,930 francs were for the penal establishment. (The franc is worth 19.3 cents.) The principal industry is gold mining. In 1901 and 1902 the rich gold deposits (placer) in the Inini River district attracted many prospectors. There is little agriculture. The reported values of imports and exports in 1900 were 9,767,228 francs and 6,583,513 francs respectively; in 1901, 12,219,161 and 8,775,637 respectively. Included in the exports was gold valued at 6,343,534 francs in 1900 and 7,966,161 francs in 1901. The foreign trade is mostly with France.

FRENCH GUINEA, a French colony in Africa forming one of the divisions of French West Africa (*q.v.*) lies between Sierra Leone and Portuguese Guinea on the Atlantic Ocean. It comprises in addition to the protectorate of Futa Jallon, several inland districts, the whole having an area of 95,000 square miles and an estimated population of 2,200,000. The capital is Konakry. The colony is administered by a governor and the country divided into circles for purposes of local administration. The budget for 1901 balanced at 6,895,000 francs. The imports in 1900 amounted to 14,275,452 francs, and the exports to 9,779,772 francs. The chief exports were rubber, 7,322,000 francs; cattle, 1,000,500 francs, and palm kernels, 477,000 francs. Rice, millet, earth-nuts, and gums are also produced. A railroad is being constructed from Konakry to the Niger, in June 93 miles of earthwork had

been completed and on November 30 the first section of 10 miles from Konakry to Simbaya was opened.

FRENCH LITERATURE. History and Biography.—The noteworthy historical works which the year 1902 saw added to French literature may be enumerated in comparatively little space. Not only are critical monographs few in number, but the vogue of the historical document—letters, diaries, memoirs—which was a prominent feature of the preceding years, has largely abated. Single volumes of several important works were issued during the year. Prof. Alphonse Aulard, of the University of Paris, who is reputed to be the greatest living authority upon the French Revolution, added a third volume to his series of studies upon that period, *Études et Leçons de la Révolution Française*. The topics treated range from the vital issues of the great struggle down to the most subordinate details of the life of the times, yet one and all bear the stamp of the same inflexible and exhaustive method. The third volume has also appeared of *La Société Française du XVIème au XXème Siècle*, the ambitious series in which M. Victor du Bled proposes to cover the history of French society, and which is already recognized as authoritative in character and entertaining in style. The new volume deals almost exclusively with the political rôle of the French noblesse—a rule which “seems to be finished and may be treated as impartially as the Roman Senate or the Venetian Signoria.” M. A. Molinier is the author of an important source-book, *Les Sources de l'histoire de France, depuis les Origines jusqu'en 1789*. When the first volume appeared its value was at once recognized. The second volume is characterized by the same abundance of documents, genealogies, chronicles, local and general; in short, all sources of history indicated, together with the essential data regarding their origin and authenticity. An interesting monograph bearing upon mediæval history is Gustave Decoudray's *Les Origines du Parlement de Paris et la Justice aux XIIIème et XIVème Siècles*. The author traces the origin of the Parliament of Paris, its constitution, the union of its separate sessions into a single annual term; in short, its whole organization as a court of justice, reserving its administrative and political functions for a second volume. Napoleonic literature, after enjoying a remarkable period of fertility, has once more fallen into neglect. René Stourm, already known as author of a masterly contribution to economic history, *Les Finances de l'Ancien Régime et de la Révolution*, continues the same line of investigation in *Les Finances du Consulat*, showing the same erudition and painstaking accuracy. *Rome, Naples, et le Directoire*, by the Baron Joseph du Teil, is a monograph tracing the diplomatic history of the campaign of 1796-97 in the south of Italy. It is conscientiously written and carefully documented, and throws interesting light upon Napoleon's political methods and aspirations at this time. A popular history of Napoleon, by Désiré Lacroix, has lately appeared, in which truth and legend are mingled with curious impartiality. A popular history of very different calibre has been devoted to the Franco-Prussian war, by Paul and Victor Marguerite. Few novelists have ever studied history more conscientiously than these two brothers did in preparation for their novels *Le Désastre* and *Tronçons du Glaive*; and in their brief *Histoire de la Guerre de 1870-71*, they reveal a surprisingly intimate knowledge of the movements of the armies, the separate engagements, and have analyzed with a rare perspicacity the causes leading to the final defeat. A lucid and penetrating study of Belgium, since 1830, from the social as well as the political standpoint, *La Belgique Morale et Politique*, comes from the pen of Maurice Wilmotte, already known as author of a recent important study of the Congo Free State.

Among the volumes which stand upon the border line between history and biography, a certain number appear annually, devoted to the lives of Frenchwomen whose exceptional careers and personalities have added much to the romance of history. To this class belongs *Les Infortunes d'une petite-fille d'Henri IV.*, by M. E. Rodocanachi. The contemporaries of Marguerite of Orleans, who was wife of the Grand Duke of Tuscany, deliberately threw a veil over the escapades of this princess who seems to have inherited something of her illustrious grandfather's faculty for amorous adventures. The Tuscan chief of police, however, kept a private journal, and upon this the present piquant and dramatic recital was based. Casimir Strylenski, who has already shown his fitness to handle the material of feminine biography, in his vivid and delicate portrayal of the Countess Potocka, has contributed a careful study of Marie-Joseph de Saxe and the court of Louis XV., under the title, *La Mère des trois derniers Bourbons*. This exceptional woman the author sums up as “an eighteenth-century princess who remained faithful to her husband, who occupied herself with her children, like a simple *bourgeoise*, and endured without complaint a long life of sorrows and mourning. Such was the mother of Louis XIV., Charles X., and Louis XVIII.” *Louis XV. et Marie Leczinska* is the title of a readable volume by Pierre de Nolhac, who has made good use of the romantic material which his subject afforded.

Military biography and memoirs, although less in evidence than usual, still had

some representation in 1902. *Le Maréchal de Luxembourg et le Prince d'Orange* is the title of a volume by Pierre de Segur, which really forms a sequel to his earlier work, *La Jeunesse du Maréchal de Luxembourg*. For ten years prior to 1678 this intrepid adversary of William of Orange tried in vain to check the latter's growing influence. On the field of battle he almost invariably was successful, but orders from the court or from Louvois were sure to follow which would upset his plan of campaign. The history of these battles, told in the utmost detail, fill the volume. *Le Maréchal Moncey, Duc de Conegliano* is the record of a curious and interesting personage who in his time played many parts. Soldier and captain under Louis XVI., general inspector of gendarmerie under the consulate and empire, minister of state and peer of France under the Restoration, he found a zealous and conscientious biographer in his descendant, the late Duke of Conegliano who did not live to see the book in print. In Charette, one of the most famous of the Chouan leaders in Brittany, M. René Bittard des Portes has found material for a monograph, *Charette et la Guerre de La Vendée*, based almost wholly upon hitherto unpublished documents. The *Souvenirs du Lieut.-General Vicomte de Reiset*, which have been for some time in course of publication, edited by his grandson, are now brought to a close with the third volume covering the years 1814-36, and containing some curious details of the "Hundred Days," as well as of the revolution of 1830. *Souvenirs d'un Caporal de Grenadiers*, is a unique little volume edited by Comte Fleury and written by a French soldier who was a member of certain troops who, in 1808, were declared prisoners of war and deported to the little island of Cabrera, in the Balearic group, where they were decimated by hunger and disease. The author of these memoirs was one of the lucky few who escaped. In writing *Le Maréchal Ney*, the Comte de la Bedeyère has not attempted to write a biography, but has simply gathered together notes, letters, documents relating to Ney, his family, and especially to his trial, which will be of great value to any future biographer.

Some memoirs of rather exceptional interest bear the title *Souvenirs sur Madame de Maintenon*, and are edited by the Comte d'Haussonville and Gabriel Hanotaux. By a curious coincidence, these two gentlemen became possessed independently of a manuscript copy of the unpublished letters and memoirs of Mademoiselle d'Aumale, the last and most attractive of Mme. de Maintenon's secretaries. They united in the task of collating the two manuscripts, and the Comte d'Haussonville also provided an introduction which does full justice to the charms of Mme. de Maintenon's "petite mignonne." Two volumes of youthful correspondence, possessing an intrinsic value that seldom attaches to the letters of collegians are Ernest Renan's *Lettres du Séminaire* covering the years 1838-46—the critical years during which he definitely decided to give up his studies for the priesthood—and Taine's *Correspondance de Jeunesse, 1847-53*. Taine had a fixed aversion to any public display of the personal and intimate side of his life, and forbade the publication of any letters excepting those of a purely general or speculative nature. Accordingly, out of all his correspondence, this volume, and the two which are promised to follow it, are all that the world at large is likely to have as a record of his more intimate thoughts and personality. They are interesting as already foreshadowing in their precocious dignity and formal correctness, the Taine of mature years. There are few women living to-day, in the Paris literary circles, whose memories could make more delightful and varied reading, than Madame Adam, the talented editor of the *Revue Blanche*. The first volume of her autobiography, *Le Roman de Mon Enfance et de Ma Jeunesse*, goes back to the days when she was still Mlle. Juliette Lamber, and justifies its title by showing quite literally the charm and variety of a romance. A romance in real life, about which the last word is likely never to be written—the romance of *Elle et Lui*, of George Sand and Alfred de Musset—has found a new exponent in the person of Charles Maurras, whose *Amants de Venise* is a psychological study of the familiar story, a sort of philosophy of romanticism.

Literary Criticism, Essays.—Among recent monographs upon authors, none deserves more attention than Arthur Chuquet's admirable study of the life and works of *Stendhal-Beyle*. With the exception of Edouard Rod's volume in the "Grands Ecrivains Français" series, there is no adequate biography or critical study of the "spirituel Dauphinois," and Chuquet's work written with great thoroughness and impartiality, is likely to be recognized as definitive. He admits that Stendhal's novels are "ill balanced and at times incoherent," but they reveal in many a passage his "profound observation of the human heart." It is well known that Stendhal's greater contemporary, Balzac, is the subject of a comprehensive study upon which Bourget has been engaged for many years. The public lately had an opportunity to judge of his method of treatment from some specimen pages which appeared in a number of the *Minerva*. Meanwhile the Comte Spoelberch de Louvenjoul publishes from time to time selections from his unrivaled collection of Balzac manuscripts. The latest volume, *Une Page Perdue de Balzac; Notes et Documents* contains fragments of an unfinished work, "Voyage imaginaire de Paris à Java" (1832).

Hughes Rebelle writes of *Les Inspiratrices de Balzac, Stendhal et Mérimée*, and there is a kindred volume by Jean Melia, *Stendhal et les Femmes*. André Chenier is the subject of two volumes of considerable interest. The first, by Emile Faguet, is not merely an admirable biography, but a valuable critique full of new and just estimates, of this last of the classic poets. The second volume is *André Chenier Critique et Critiqué*, by Paul Glachant. Living as he did in the transition period between classic and romantic art, Chenier assumed the right to "revise the republic of letters." M. Glachant has conceived the happy idea of extracting from Chenier's writings a sort of code of poetic laws. The second half of the work deals with the bibliography of Chenier, the history of the text, the opinions of his critics, and a host of kindred themes. *Alfred de Vigny et son temps*, by Léon Seché, is a comprehensive work, full of hitherto unpublished details, notably the chapter upon de Vigny's love for Mme. Dorval, which as the author says, "throws a beacon light over his whole life." A group of special studies upon certain classic writers should be briefly noted: *Les Epoque de la Pensée de Pascal*, by Gustave Michaut, a new and amplified edition of a work which was previously published as an introduction to the critical edition of the *Pensées* that was crowned by the Academy. *Du Sentiment artistique dans la Morale de Montaigne*, by Edouard Ruel, is a posthumous volume, the single fruit of a life of research. In the eyes of Ruel, Montaigne was fundamentally an artist—his mental and moral scope, his methods of work, his style, his very language, are "to be explained on this basis and no other." There is an introduction from the pen of Emile Faguet, who is the author of still another volume, of mingled literary and historic interest: *La Politique comparée de Montesquieu, de Rousseau et de Voltaire*. There has long been a tendency to regard these three writers as the original instigators of the French Revolution; and this is precisely what M. Faguet seeks to establish in his erudite little volume.

Literary and critical essays are less numerous than usual. Henry Bordeau has gathered together a second series of *Les Ecrivains et les Mœurs*, containing estimates of such novelists as Balzac, Stendhal, Bourget, Rod, the Brothers Margueritte, poets like Jean Moreas and Henri de Regnier, and numerous foreign writers, such as d'Annunzio, Tolstoy, Kipling, and Ruskin. *La Poesie Nouvelle* is the title of a group of twelve essays by André Beaunier, based upon the assumption that "from 1885 to 1900, a new poetry lived and flourished with an abundance of life that was surprising." Jules La Forge, Gustave Kahn, Emile Verhaeren, Maeterlinck, and Henri de Regnier are among the poets discussed. Jean Lorrain has collected the best of his impressions of recent years upon current literary and artistic topics, into a volume which he calls *Poussières de Paris*.

Fiction.—It is scarcely five years since a French critic felt himself justified in summing up existing conditions with the phrase "Literary Anarchy." The naturalistic, psychological and symbolic schools had successively had their day, and an era of individualism had set in. It would be difficult to pick out a group of writers who then seemed more hopelessly far apart than Zola, Bourget, Anatole France, Edouard Rod, and Maurice Barrès. But in the interval a new movement has arisen, and these very writers have gradually drawn together. While preserving their individuality of method, they show in their latest volumes a community of purpose, the purpose of making serious studies of existing sociological and ethical conditions. There can be little question that Zola anticipated, and in a measure directed, this tendency, and that his last group of novels, inferior though they were to the greater part of his earlier work, exercised a potent influence on fiction on the threshold of the new century. *Vérité*, the third volume of Zola's Four Gospels, and the last volume he was destined to write, bears on its title page the date 1903; nevertheless, it logically belongs to the books of the previous year—the year of its author's death, the year of its appearance as a serial, the year when it was being widely discussed. Owing to extrinsic circumstances it is likely to have as great a vogue as any book its author wrote. While fitting into the general scheme originally outlined by Zola for his tetralogy, *Vérité* is more of a political pamphlet than a novel. Although cleverly modified in regard to the concrete facts, it is really a disguised report of the Dreyfus case, as Zola saw it, and the author masquerades as his own hero. The book has nothing to do with the French military circles, nor is it to any great extent a story of the law courts. In place of the army of war, he has substituted the "army of peace," the French school system, and has sought to picture the struggle going on between the state schools and the schools controlled by the Roman Catholic Church. The rôle of Dreyfus is played by a teacher in one of the state schools, who, because he is a Jew, is chosen as the scapegoat to bear the burden of a crime committed by one of the Jesuit teachers—an unnatural crime culminating in the murder of one of the pupils. Aside from these modifications in structure, the book reads like the columns of the daily press during the famous trial at Rennes; in one respect, it serves a useful purpose. It makes clear to the Anglo-Saxon much that was at that time incomprehensible—the feverish excitement, the blind, unreasoning prejudice, the

phenomenal obstinacy, the internal dissension that severed life-long friends and even families in their bitter partisanship over the famous "Affaire." As a document of contemporary social conditions, *Vérité* will be likely to live—as a novel, it will seldom be taken from the shelves.

Sociology in a novel by Zola is only in the natural course of things. But a sociological novel from Bourget is an unlooked-for novelty. After identifying himself for years with dramas of passion, the unseen, inner dramas of the heart, he has deliberately turned to a wider field, and in *L'Étape* has undertaken to study a crisis in family history—the crisis which comes only too frequently in these days of rapid progress, when the social strata are no longer so clearly marked in France as in the past, and when parents see their children outgrow them and pass beyond them into circles where they themselves cannot follow. M. Bourget sees peril in these new conditions; he thinks the tendency of the young men and women of to-day who flock to Paris from the provinces is to rise too fast, faster than they are able to readjust themselves to their new conditions, and that the consequences only too often are tragic. And something of all this he has attempted to interpret in *L'Étape*. Edouard Rod is another of the writers who after studying the problems of women's hearts for many years, turns aside to study the struggle of men who find the burden of life too heavy for them. *L'Eau Courante* is the pregnant history of a family of peasants honest, hard-working, worthy folk, who little by little find themselves dragged nearer and nearer to the brink of ruin. Day by day, hour by hour, he traces the growing misery of this family, crushed under the weight of a mortgage, which at the outset seemed a trivial burden. And around them, the neighbors, envious and watchful, await their chance like birds of prey, to reap the fruit of the disaster which they see approaching. Maurice Barrès, in *Les Déracinés*, the first volume of his "Energie Nationale," published some years ago, began to study the evils which come from too great ambition on the part of the younger generation, and more especially those who leave their homes to plunge in the maelstrom of Parisian life. *Leurs Figures*, the latest volume of the series, has in a measure lost sight of the original purpose, and is political rather than social. It is a picture of parliamentary life in the stormy days of the Panama scandal, and some of the central figures of that drama are hit off with a grim irony and a masterly touch that quite justify the praise the book received.

Other volumes of the past year, which without showing the strength of those already mentioned, ranked high in popular favor, include: *Le Jardin du Roi*, by Paul and Victor Margueritte, a delicate and charming love story, presented in the picturesque setting of Versailles; *L'Enfant d'Austerlitz*, by Paul Adam, which in a certain sense is a sequel to *La Force*, and traces the mental and moral development of a young French lad, whose father was an officer of Napoleon, and fell in battle; *L'Épave*, by Edouard Estaunié, which, like the last mentioned volume, is the history of a conscience, depicting the moral crisis in the life of a young girl, whose father has trained her in agnosticism, and who after his death, feels herself strongly tempted to take refuge in some spiritual faith; *Les Embrasés*, by Michel Corday, a curious volume, the scene of which is laid in a sanitarium, where the inmates have no other resource to while away the tedious hours, than their day-dreams of love which "like an ardent flame, consumes the hearts of men." Two new volumes come from the fertile pen of André Theuriot—*La Soeur de Lait*, a simple story of village life; and a collection of short tales, *Contes de la Marjolaine*. Other novels which deserve at least passing mention are: *La Maison du Péché*, by Marcelle Tinayre; *Le Voeu de Beatrice*, by Mme. Octave Feuillet; *Une Demi-Carrière*, by the Comte de Comminges; *La Marche de L'Amour*, by Georges Ohnet; and *Le Bon Plaisir*, by Henri de Regnier, a novel of the time of Louis XIV., in which the atmosphere and even the literary style of the time are delightfully reproduced.

FRENCH SOUDAN, a region of Africa comprising territories under French protection or influence, lies south of the Sahara and extends from Senegal eastward to the Egyptian Soudan. The area is estimated at about 300,000 square miles and the population at between 3,000,000 and 4,000,000. There is a considerable caravan trade across the desert to Tripoli and Morocco. The imports include textiles and hardware and conspicuously perfumes; these last, which come principally from Germany and Bulgaria, amount annually, according to the *Nachrichten für Handel und Industrie*, to over \$770,000. While this part of Africa is recognized by the civilized powers as being within the French sphere, it is not so regarded by the inhabitants, who stand for Mohammedanism and tribal independence. For a number of years up to 1902 a teacher and leader of the Senussi, probably the most powerful Moslem tribe of the Soudan region, calling himself the Mahdi and known variously as Mohammed-es-Senussi, the Mahdi-es-Senussi, and the Sheikh Senussi, carried on by himself and through emissaries a vigorous religious and political propaganda in the Sahara oases and the Soudan. There is little doubt that Mohammedanism is steadily encroaching southward upon pagan Africa. Of this movement the work

of the Sheikh Senussi was an important factor and became a real menace to the French advance. But in the spring of 1902, while striving to extend their effective influence eastward toward Wadai, the French encountered the Senussi tribesmen and defeated them, though with difficulty, at Bir Alali, about 90 miles northeast of Lake Tchad. The French have easily overcome the black races, but it was thought that any further conquest of the Senussi, who show the same general fighting qualities and fanaticism encountered by General Kitchener in the Egyptian Soudan, would necessitate a large increase of the French military forces in the Soudanese region. After the battle at Bir Alali, however, the prestige of the Sheikh Senussi appeared to decline, and in August, 1902, advices from Fezzan, received at Jerba (Tunis) announced that his death had occurred in Kanem. Though regarded by his followers as a man of miraculous power and probably as a sort of combined emperor and pope of the desert, he was, according to some reports, "merely a harmless missionary to the Soudanese infidels." It seems more likely, however, that though his military resources may have been overestimated, his influence, partly political and partly religious, was strong and far-reaching. The victory at Bir Alali, though perhaps a short step, nevertheless marked some progress in the French advance. What Gordon began and Kitchener finished in the Egyptian Soudan, the French seem determined to carry out in the Sahara and the central and western Soudan.

FRENCH WEST AFRICA, comprising all the possessions of France in Africa south of Algeria except French Congo, grouped together for administrative purposes. The territory includes the colonies of Dahomey, French Guinea, Ivory Coast, and Senegal and the hinterlands of Upper Senegal and Middle Niger, with an aggregate estimated area of about 500,000 square miles, and a population of between 9,000,000 and 10,000,000. The separate colonies were originally grouped together in 1899, but by a decree of October 4, 1902, the administration was entirely reorganized. The new plan provides for a governor-general for all the French West African territories whose headquarters are at Dakar in Senegal and not at St. Louis as formerly. He is the actual chief of the colonial service, like the governor-generals of Indo-China and Algeria. Under him there is a special lieutenant-governor for Senegal resident at St. Louis, and he will be assisted by a secretary-general for all the colonies, and by a council. There will be no general budget. All appointments to the service are made either by the governor-general or by the French minister of colonies on his recommendation, and all branches of the service are under his direction. Each colony, however, retains its administrative and financial autonomy, has its own governor and prepares and regulates its own budget. The former protectorate of Senegal, under the new arrangement has been united with the territories of the Upper Senegal and Middle Niger to form a new administrative and financial district to be known as the "Territory of Senegambia and the Niger." This interior region will be under the direct control of the governor-general of French West Africa and his council, and will have a special budget made up from the receipts from these territories themselves, and contributions from the other associated colonies.

The new governor-general, M. Raume, who had proved his efficiency and administrative ability as a successful governor of Senegal, is a progressive and far-seeing man, and if he is allowed a free hand in his plan for the development of French West Africa there is every reason to believe that it will become one of the best paying and most productive colonial investments of the French republic. His programme includes the construction of an extensive system of railways, some of which are already being built, running inland from the coast of each of the four colonies and meeting in the common hinterland; the improvement of the ports; the dredging of the rivers, and regulation of their flow in order that they may be used for irrigation purposes.

FRIENDLY ISLANDS, three groups of islands in the southern Pacific, known as Tonga, Hapaai, and Vavau, constitute a British protectorate, as the outcome of the Anglo-German agreement of November 14, 1899. The aggregate area is stated at 374 square miles and the population upwards of 20,000. Government is administered by a native king (Jioaji II., since 1893), who is assisted by a legislative assembly; while British interests are represented by a deputy commissioner under the high commissioner and consul-general of the Western Pacific. In 1901 revenue and expenditure amounted to £20,900 and £20,893 respectively. The principal articles of export include copra, candle nuts, fungus, and fruit. The imports and exports respectively have been valued as follows: 1899, \$360,724 and \$345,089; 1900, \$432,720 and \$519,708; 1901, \$312,716 and \$428,291. In April, 1902, it was reported that dissatisfaction with the native courts had led the Europeans in the Friendly Islands to petition the imperial authorities to place all foreigners under the jurisdiction of the British officials.

FRIENDS, SOCIETY OF, commonly known as Quakers, a Christian sect which originated in England in the seventeenth century and which, it is believed, held a yearly meeting in this country as early as 1661. The Friends, with a total membership throughout the world of some 140,000, are most numerous in the United States, where they have about 120,000 members, comprised in the four divisions: Orthodox—1190 ministers, 830 churches, and 91,614 members; "Hicksite"—115 ministers, 201 churches, and 21,992 members; "Wilburite"—38 ministers, 53 churches, and 4468 members; Primitive—11 ministers, 9 churches, and 232 members. The Quakers have been always noted for their educational interests. They maintain several higher institutions, among the more prominent being Haverford College (Orthodox) and Swarthmore College ("Hicksite"), besides a number of efficient secondary schools, many of which are controlled in common by both branches. The Orthodox body has conducted since 1871 progressive foreign missionary work, and both divisions have been actively identified with efforts for the improvement of the Indians and negroes, and with various reform movements. The foreign missions of the Society of Friends now include 22 stations and 43 out-stations, employing 64 missionaries and 135 native laborers, and having 22 churches with 1810 communicants. The total income for 1901-02 was \$49,697. A general conference, attended by some 3000 delegates, was held in Asbury Park, N. J., in the early part of September, 1902; but the most important event of the year was the organization among the Orthodox Friends of the five-year meeting in Indianapolis (October). This convention was the result of an effort to effect closer association of the yearly meetings, eleven in number, by means of a general body with definite powers. The action of the meeting that has attracted most attention was the general call, issued at the closing session, to all Christian churches to participate in a conference on the liquor traffic, to be held in Washington, D. C., beginning on the second Wednesday of March, 1906.

FRIES, WULF (CHRISTIAN JULIUS), a German-American violoncellist, died in Boston, Mass., April 29, 1902. He was born in Garbeck, Holstein, Germany, January 10, 1825, and in his youth taught himself the violoncello. In 1847 he came to the United States, and two years later assisted in the organization of the Mendelssohn Quintet Club, in which he was the 'cellist for 23 years. He was a prominent figure in Boston musical circles, played often with the Harvard Musical Society, and the Handel and Haydn Society, was an active member of the Beethoven Quintet Club, and in 1873 made up the trio with Wieniaski and Rubenstein during the latter's visit to Boston. He was well known as an artistic performer and successful teacher.

FRIGOTHERAPY. Raoul Pictet, of Switzerland, who discovered the process for the liquefaction of oxygen, has lately invented a method of treatment that he calls by the foregoing name. The patient is placed in a metal well lined with thick furs. This is surrounded by an outer shell containing a combination of sulphurous and carbonic acids in a liquid state, kept at a temperature of 110° F. below zero. The patient is said not to feel cold, but to experience on the contrary, a rise of from $\frac{1}{2}^{\circ}$ to 1° in temperature in five minutes. The duration of the treatment ranges from 5 to 15 minutes at a time. The applicability of the treatment to definite diseases has not been worked out, but chronic nervous diseases are most likely to be benefited.

FRITZ, JOHN, American iron and steel manufacturer, was born at Londonderry, Pa., in 1822. In his honor the John Fritz medal for discovery or achievement in science and industry was founded in 1902 by the joint action of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers, and the American Institute of Electrical Engineers. Though first employed as a blacksmith and then as a machinist, he was early engaged in the iron and steel industry, and by long experience and thorough study has become one of the greatest living authorities upon their manufacture. He has for many years been a dominant factor in the development of the iron trade in the United States, was among the first to recognize the importance of Sir Henry Bessemer's discoveries, and has made experiments of lasting value with many other processes. He designed and built the immense forge and armor plate plant at Bethlehem, Pa., which he managed for many years, and was the promoter of other similar establishments. Several engineering societies in the United States have at different times elected him president, and he was one of the American "Captains of Industry" invited to meet Prince Henry of Prussia during the latter's visit to the United States early in 1902.

FULLER'S EARTH. See MINERAL PRODUCTION.

GALLAUDET, THOMAS, an American clergyman, prominent in the education of deaf mutes, died in New York City August 27, 1902. He was born in Hartford, Conn., June 3, 1822, graduated at Trinity College (Hartford) in 1842, was ordained

GALVESTON SEA WALL. Work was begun during 1902 on a sea wall to protect the city of Galveston, Tex., from the flood waters of the Gulf of Mexico during exceptionally severe storms. The city of Galveston is located on the eastern end of Galveston Island. The original elevation of the island was in many places but little above ordinary high tides of the Gulf and at extraordinary high tides the water came into the streets in many places. This condition was ameliorated somewhat by filling up the low places with material at first hauled in from the sand hills which had formed along the gulf beach. Afterward this filling material was brought from the island at a point several miles west of the city, and from the mainland by rail, and later it was obtained by dredging from the bay. Even with this filling the ground level was at the highest parts of the city only 8.9 feet above mean sea

level and at the lowest points it was scarcely 4 feet above the same datum. The higher portions of the city are generally above overflows during storms, and it is only during phenomenal storms that the city is completely or to a great extent submerged. Such storms have occurred at intervals of every few years since 1834, when the first record was made, but the most severe one on record was that of 1900 when the water reached a height of 15.7 feet and the wind and waves destroyed a considerable portion of the city. The great destruction of life and property by this storm led the people of Galveston to take precautions against similar disasters in the future and in the fall of 1901 a board of engineers was appointed to study the situation and to devise a method of shore protection which would render the city safe from the gulf waters. This board submitted its report in April, 1902. The plan proposed was to build a concrete sea wall to protect the east and south sides of the city and a levee to protect the west side, and to raise the level of the city by filling in behind these barriers. The sea wall was to be $3\frac{1}{2}$ miles long with its top 17 feet above mean low water. This wall was to be founded on piles and protected from undermining by sheet piling and riprap. The sea face of the wall was to be curved so that its upper portion would be vertical and its rear face was to be filled behind by an embankment the top of which was to be paved with brick for a width of 35 feet and planted with Bermuda grass for a further distance of 60 feet. The levee was to be 300 feet wide, with side slopes of one foot in 25 feet, and was to be built upon. In brief, by the proposed plan the city will be surrounded on three sides by a structure whose top is higher than the high water of 1900. The fourth or unprotected side is that facing Galveston Bay and here the city is higher than the highest water ever recorded previous to 1900. The total cost of the work

recommended by the board was \$3,505,040, of which sum \$1,294,755 was for the sea wall. Shortly after the board had made its report work was begun on the sea wall and at the end of 1902 it was being actively prosecuted with a large plant of special machinery.

GAMBIA, the oldest British colony in Africa, lying on the west coast, extends along both banks of the Gambia River. The area of the colony proper is 69 square miles, with a population on April 1, 1901, stated at 13,456; the Gambia protectorate has an area of about 3550 square miles, with a population on the same date of 76,948. The governor in 1902 was Sir George C. Denton (since 1900). Revenue and expenditure amounted to £49,161 and £29,818 respectively in 1900 and £43,726 and £48,518 respectively in 1901. Of the revenue in the latter year more than 75 per cent. was derived from customs; the unusually large expenditure in that year was due to military operations. The colony has no debt and at the end of 1901 there was a surplus of £58,115. Imports and exports were valued at £277,659 and £281,976 respectively in 1900 and £252,647 and £233,667 respectively in 1901. In the latter year ground nuts comprised over 70 per cent. of the exports. There is a notable growth of Mohammedanism in this part of Africa; in Gambia the Mohammedans form nearly three-fourths of the population. The governor of the colony thinks this growth "will be an advantage, although the revenue from the spirit trade will decline."

GARBAGE DISPOSAL. Outside of the larger cities of the United States the most common means of garbage disposal continues to be dumping on land or in water at the most convenient point where such dumps will be tolerated. In some sections, particularly in New England, feeding to hogs is a common means of disposal, but this is objectionable unless the material is quite fresh. Where improved means of disposal have been adopted, the choice has been between cremation and reduction. The object of the latter practice is to recover grease from the garbage and to render the tankage available for fertilizing material. Since an elaborate and expensive plant is required for reduction purposes such works are almost invariably restricted to the larger cities. Of the 1524 places of over 3000 inhabitants included in the *Municipal Year Book* (New York, 1902), 22 reported crematories and 75 reduction works, making 97 in all. At Chicago and at Des Moines, however, the garbage furnaces consume so small a portion of all the garbage collected as to be of little account, and in a number of other cities the amounts the furnaces take are far below the needs of the population. Of the 22 reduction works, 15 are in places of 100,000 population or more. The 97 places already mentioned, with their populations by the United States Census of 1900, and with the system of garbage disposal in use, are shown in the table on the following page.

The garbage furnaces at Milwaukee were put in operation early in 1902. They have a contract capacity of 150 tons a day, and are located on Jones's Island, just inside the mouth of the harbor, to which point the garbage is brought by boats. Contracts for garbage disposal at Baltimore and at Newark have been awarded with the understanding that reduction works will be built. In Great Britain garbage furnaces, or refuse destructors, are relatively more common than in the United States, and many recent installations are operated in connection with electric light and power plants, the heat from the destructors being used to raise steam in boilers and thus to furnish a portion of the energy needed to drive the dynamos. As a rule, the British furnaces are far better designed and operated than those in this country, and the refuse consumed there, it is believed, contains more combustible matter than is the case in America. Here it is very rare for a city to be able to burn its garbage without the use of large quantities of extra fuel, and save for the small furnace at Chicago it is doubtful if any attempt to utilize heat is made. A portion of the dry, combustible refuse at Boston is collected separately, the salable paper and other material sorted out, and the balance discharged over an endless belt into a furnace, the heat from which develops steam for use in the plant itself. At New York a single furnace for burning the same class of refuse was built in 1902. Descriptions of the new Milwaukee garbage furnaces, and of the New York refuse burning plant, were given in *Engineering News* for January 23, and for April 17, 1902, respectively.

GARDNER, SAMUEL RAWSON, an English historian, died February 23, 1902, at Sevenoaks, Kent. He was born March 4, 1829, at Ropley, Hampshire, and was educated at Winchester College, and Christ Church, Oxford. After receiving the degrees of J.U.D. and Ph.D. at Edinburgh and Göttingen, he entered upon a life of indefatigable historical research. In 1863 appeared the first two volumes of his history of the Stuart kings. He found that on the scale projected he could not carry the work beyond the death of Cromwell, and even with this limit set, just failed of completing the last installment, which comes only down to 1656. Owing to the inadequacy of his private means he felt himself constrained to accept the chair of history at King's College, London, in 1871, and thus his production was restricted

during the middle years of his life. His most valuable educational work was done as a lecturer, a capacity in which his attainments were displayed to the greatest advantage. In 1882 he received a civil list pension of £150, and in 1884 was elected to a research fellowship by All Souls' College, Oxford, upon the lapse of which a similar endowment for life was conferred upon him by Merton College. His work is notable for the extraordinary care lavished on the smallest details. He is said to have been the only man who has read the entire collection of Thomasson Tracts in the British Museum. Besides learning most of the European languages for the sake

§ Small portion.

of consulting original historical sources, he visited the scene of almost every battle that he described. He possessed the gift of judicial insight in a marked degree, and combined it with great political impartiality. His style is lucid, and although somewhat subdued in his earlier work, is more enlivened in the later volumes. In 1883 he republished his history, which had appeared as five separate works, under the collective title, *A History of England from the Accession of James I. to the Outbreak of the Civil War, 1603-42*. In 1886, 1889, and 1891, appeared the three volumes of the *History of the Great Civil War, 1642-49*, and in 1894, 1897, and 1901 were issued the three volumes of the *History of the Commonwealth and Protectorate*.

GAS, ILLUMINATING and FUEL. Three features of the gas industry, notable for several years past, are more prominent than ever: (1) The increasing use of Welsbach or other incandescent burners, thus tending to make calorific values of far more importance than candle power; (2) the quiet but steady progress of carbureted water gas; (3) the multiplication of coke-ovens, at which illuminating

and fuel gas is produced as a by-product. As to carbureted water gas, one American company alone is said to have secured contracts in 1902 aggregating a daily capacity of about 33,000,000 cubic feet. In Europe, also, this gas is making good headway. The distribution of gas under pressure, begun only a few years ago, is being extended, particularly where it is desirable to supply a number of relatively small and scattered communities from a single gas generating plant. The relative advantages of cast iron and wrought iron mains for distributing gas were discussed by Mr. Godfrey L. Cabot, of Boston, in the *American Gas Light Journal* for May 12, 1902. The author stated that after studying the subject by personal investigation in several countries in Europe, and also in New York, Philadelphia, and Pittsburg, he was convinced that the gas leakage from cast-iron mains "is incomparably greater than in our wrought-iron mains, which have a total length of 60 to 70 miles, and handle from 9,000,000 to 10,000,000 cubic feet of gas per day."

Three important lectures on *The Future of Coal Gas and Allied Illuminants* were delivered by Prof. Vivian B. Lewes, in the latter part of 1902, before the British Society of Arts. In these lectures the history of coal and water gas is sketched, the processes involved and their various improvements are described, and still further possible improvements are pointed out. Incandescent gas lighting, including the Weisbach and other devices, is considered at length. The author notes the rapidly increasing use of large gas engines to drive dynamos in England and in continental Europe, a practice also found in America. In view of the use of gas engines for this and other purposes, and of the possibilities of low candle power gas where incandescent mantles are used, Professor Lewes believes that "the gas of the future" will be as low as 12 and finally 10 candle power, and will be "made by mixing blue water gas with coal gas" without "any need for enrichment." He goes on to say that, after allowing time for adjustments, the 12 candle power gas will have a calorific value of not less than 460 British thermal units net, and a selling price of not more than 2s. (49 cents) a thousand, the economies necessary to reach this lower price being brought about by making the gas in the holder at 9d. to 9½d. (18 to 19 cents) a thousand, and distributing at a considerably increased pressure, the pressure being regulated down to 1½ inches at the entrance to the consumer's meter. Gas fittings should be entirely taken over by the gas companies, who should supply incandescent fittings and mantles, and keep them in order at a small yearly rental; and where swinging brackets and other causes demand flat flame burners, the companies should fit nipples with broad slits regulated to burn at the lowest possible pressure.

Dr. S. H. Durgin, of Boston, in his report to the American Public Health Association, shows that the common condition of gas pipes and fixtures in Boston is very poor, small leaks very numerous, and that a moderate increase of pressure in the fixtures above the ordinary produced leakage in 89 per cent. of all houses examined. It was also shown that the number of fatalities from illuminating gas is large and is increasing from year to year. In order to ascertain to what extent the medical profession in Boston had recognized cases of acute and chronic gas poisoning, inquiries were sent to 2200 physicians. Replies were received from 460 physicians; 246 reported no experience, the other 214 reported 1025 cases of acute poisoning; 374 of these were fatal, 288 were found dead, and 86 lived from one hour to twelve months, 623 made complete recoveries in periods varying from a few hours to three years, 28 made partial recoveries in from three weeks to twenty-one months.

GAS, NATURAL. See NATURAL GAS.

GASTROPTOSIS is the displacement downward of the stomach, variously attributed to lax and weak abdominal walls, anomalies of intra-abdominal pressure, inflammatory adhesions that contract and draw the organ downward, and relaxation of the peritoneal supports. The condition is usually accompanied by downward displacement of other viscera, as the liver, kidneys, and intestines, and usually results in chronic ill-health, with gastro-intestinal disturbances, pain, and all the diverse symptoms of neurasthenia or hysteria. The treatment of this condition has been unsatisfactory and several operations have been devised for its relief. The latest procedure of this kind, devised by Dr. Coffee, of Portland, Ore., is described by him in the *Philadelphia Medical Journal*, of October 11, 1902. This consists essentially in suspending the stomach in a hammock made of the great omentum (the fatty apron hanging in front of the intestines). In this operation the abdomen is opened, the stomach exposed, and replaced in its normal position, any adhesions found being divided; then the omentum is stitched to the anterior abdominal wall, forming a permanent pocket, beyond which the stomach can not descend. In the two cases that are reported the operation afforded complete relief.

GEMS. The mining of sapphires and turquoises, the most valuable of the precious stones found in the United States, made satisfactory progress during 1901. New discoveries of turquoises were reported at Lajara, Col., in Nye County, Nev.,

and Mohave County, Ariz. Six companies were engaged in exploiting the turquoise deposits of New Mexico, which now supply the bulk of the world's output. The newly discovered sapphire mines on Yogo Creek, Fergus County, Mont., were operated by two companies; specimens weighing four carats and a few even larger were found. Among other new developments in 1901 were the finding of beautiful epidote crystals on Prince of Wales Island, Alaska; the discovery of a new mine of colored tourmalines at Mesa Grande, San Diego County, Cal., and the discovery of delicately colored vesuvianite on Indian Creek, Siskiyou County, Cal. A diamond of good quality and weighing $3\frac{1}{2}$ carats was found near Columbus, Ga., thus adding a new locality to the already large list of occurrences in the United States. The value of the precious stones mined in the United States in 1901 was \$289,500; the importations to the United States in 1902 amounted to \$18,546,313.

GEOGRAPHIC SOCIETY, NATIONAL, an organization founded in 1888 for the publication of the results of geographical exploration and research. Every State in the Union is represented in the society's membership, which numbers 2600; of these, 900 are resident in Washington. The society publishes an illustrated monthly, the *National Geographic Magazine*, which is sent to members free of charge. The principal work of the society in 1902 was the sending of a special commission to Martinique and St. Vincent to study the volcanic disturbances on the islands. The members of this commission were Dr. Robert T. Hill, the well-known geologist; Prof. Israel C. Russell, of the University of Michigan; and Mr. C. E. Borchgrevink. Reports of the commission were published in the *National Geographic Magazine* for July and December, 1902. President, Alexander Graham Bell; secretary, A. J. Henry, Corcoran Building, Washington, D. C.

GEOLOGY. In addition to the usual number of scientific investigations which were carried on, the results of which were published in various scientific journals, the year 1902 witnessed several important discussions and discoveries that deserve more than a mere bibliographic mention.

Petrography.—The foremost among the papers requiring detailed consideration is one by J. P. Iddings, L. V. Pirsson, H. S. Washington, and W. Cross, entitled *A Quantitative Chemico-Mineralogical Classification and Nomenclature of Igneous Rocks* (*Journal of Geology*, x., p. 555), in which an entirely new system of classification and nomenclature is proposed. Ever since the science of petrography was first outlined by Van Leonhard in 1823, numerous classifications have been proposed, but most of these have been found to be unsystematic and unsatisfactory, at least, in certain parts. With the introduction of the microscope in the study of rocks, a better conception of the mineralogical character and relations of rocks was obtainable, and consequently an improvement was visible in the classification, following this period. The system of classification of igneous rocks most commonly used by petrographers at present is that of Rosenbush, which is based on mineralogical character and texture. But even though this has come to be widely used, still it is open to the objection that the rocks are not always placed in the positions that indicate their true genetic relations. Much confusion has undoubtedly existed in petrography, due to the redefinition of old terms and the lack of uniformity in the application of existing systems. Furthermore, as the authors of the new system claim, and perhaps not without reason, the present systems are founded to a large extent on theory rather than on facts, while the nomenclature is inadequate to point out the relations of the different kinds of rocks. In the new classification the authors propose that the classification of all igneous rocks shall be based on their chemical composition, and therefore all rocks of like chemical composition will be grouped together. Both the definition of the chemical composition of the rock as well as of a unit of classification are expressed in terms of certain minerals which are capable of crystallizing from a magma of given chemical composition. This does not mean, however, that they always do so. In order to form their groups the authors first separate the rock-making minerals into two groups: (1) That containing the more silicious alkali—and calcic aluminous ones, such as quartz, feldspar, leucite, etc.; and (2) that containing the ferro-magnesian minerals, such as wollastonite, olivine, hematite, apatite, calcite, etc. The former group is termed the *salic*, the latter the *femic*. With this new system the chemical composition of a rock must be known in order to classify it, and this is either determined accurately by chemical analysis or approximately by a physical or microscopic optical examination. Since, however, a magma may crystallize on cooling into different mineral combinations, depending on conditions (such as temperature, pressure, etc.), the authors find it necessary to select a certain set of *salic* and *femic* minerals as a uniform standard of comparison. This standard mineral composition is termed the *norm*. It is not, however, the same always as the actual mineral composition, and the latter is therefore termed the *mode*. The rocks are divided into five classes, depending on the relative proportion of minerals present belonging to the two groups (*salic* and

femic) of standard minerals, and according as one or the other of these two groups alone constitutes the norm or is in excess, abundant, or rare. These classes are further subdivided into orders which are again based on the relative amounts of silic and femic minerals. A further subdivision is made into *rangs* and *grads*. Each of these may be further subdivided, into sub-orders, sub-rangs, and sub-grads. The texture of the rock which was an important factor in the classification of Rosenbush and others is believed to be of minor importance, and is considered after the chemical composition. The new system calls for an entirely new nomenclature and that supplied is based on a definite system, although the names proposed sound rather strange at first. The nomenclature consists of three parts designating respectively the chemical composition and the standard mineral composition, the actual mineral composition, and the texture. The last two are adjectival terms, and suffixes are also used to designate the position of the name, whether a class, order, rang, or grad. There has not yet been time to see whether the classification will stand the test of extended criticism. It is somewhat doubtful whether, for instance, German petrographers will adopt it, and still, even if not universally accepted, the suggestions brought out by discussion may lead to something better and more satisfactory than the existing classifications. Some petrographers have objected to the placing of texture among the characters of minor importance, while others consider that the assumption of a standard mineral composition which may differ considerably from the actual mineral composition is apt to be misleading and not fully warranted. To meet the objections raised against its complexity the authors have proposed a simplified form of their scheme for field use and elementary work.

Areal Geology.—Geologists engaged in mapping the areal distribution of the different formations have often been puzzled to know just what to use as a geological unit, and whether the criteria employed in mapping should be of a paleontological or lithological character. In the latter part of 1901, Mr. Bayley Willis brought out some suggestive facts on the individuals of stratigraphic classification in which he considered that the lithologic characters should be first considered and that they should be supplemented by a consideration of the form and details of the formation plotted, and their distribution in stages; for, as he points out, the lithologic characters can not always be safely used as a basis. It is true that in some cases they are reliable, but in others the lithologic characters are so inconstant that the paleontologic evidence must be used. Still the fact that life has been continuous, that faunas and floras migrate, and that shorelines do the same, shows that time divisions of exact synchronous value can never be established upon either faunal changes or lithological characters of sediments alone. Some geologists have, however, long made it a custom to recognize fossils as the best available means for determining the systematic correlation of geological formations. In making such correlations the degree of likeness expressed by the number of species is taken usually as the measure of contemporaneity. For correlations on a finer basis and for tracing or estimating the limits of local formations by means of fossils, more accurate methods than mere identity are necessary. In 1902 Prof. H. S. Williams, a leading American paleontologist, pointed out the danger of a too extensive use of faunas for the purposes of exact correlation. It is known, for instance, that certain faunas may have a wide range, while others may seem to stop abruptly and new ones begin immediately above them. The early geologists would have pointed to this as evidence of sudden extinction, but it simply means a migration of these faunas to another region, just as the fauna that suddenly appears above them may have moved in from elsewhere, and the life period of a fauna is therefore not what it appears to be in any particular section. As sedimentation may continue over a wide area, the shifting fauna may be found at a higher horizon in one region than in another, and therefore if we should attempt to correlate the two series of strata containing this fauna by means of its presence we should be grouping together rocks of different age.

Many workers in the Appalachian region, in attempting to trace the individual formations from west to east and to correlate them by means of the contained fossils, have observed a great difference in the stratigraphic succession as soon as they entered the area lying just west of the Appalachian protaxis. It was assumed, however, that a stratigraphic continuity really existed, while the more fragmental character of the sediments along the western flank was believed to indicate little more than proximity to the eastern shoreline of the great interior sea that existed in the Mississippi Valley during the Paleozoic times; moreover, the interruption in the gradual change eastward in the character of the deposits was generally ascribed to overthrust faulting. The solution of this problem, which has engaged the attention of American geologists for more than half a century, seems to have been recently solved by Messrs. Ulrichs and Schuchert, after long and careful field work (Bulletin 52, New York State Museum). They believe that the present North American continent was in existence and practically full development of outline in

the Algonkian times (a view quite different from that hitherto held by most geologists), and that since that period the Canadian shield and other small Archæan land areas have never been wholly submerged. The present main lines of elevation were in existence in Algonkian times and have been maintained without serious modification to the present day. The anticlinal folds of the Appalachians that began in the Paleozoic era and later were in common with those of older date, never changed except possibly to undergo a periodical accentuation and a shifting of their axes landward. Ulrichs and Schuchert believe that the greater part of the interior of the continent was land in early times, and that the real birth of the great interior or Mississippian sea began with the middle Cambrian. From that time up to the end of the Carboniferous there has been a succession of elevations and depressions, between which there seems to have existed a rhythmic relation. The theory is advanced that these oscillations of the interior of the continent should serve as the basis of a revised classification of the rocks of North America. This is rather a return to the ideas expressed years ago by Eaton and Newberry. In accordance with this theory each system should begin with a subsidence and end with an emergence, and we should have a classification quite different from that now in use. The Mississippi sea was probably quite shallow, and even showed tidal flats in many portions of it. From the middle Cambrian up to the end of the Carboniferous there were a series of elevations and depressions along the Appalachians, which separated the Atlantic Ocean and the Mississippian sea from time to time. An important movement occurred at the close of the Beekmantown epoch, when the Mississippian sea was restricted more and a fold was developed on the western side from the Appalachian Valley extending from Alabama to Newfoundland. The two seas were separated by several barriers until late in Oriskany time, and another period of separation occurred in the Marcellus as well as in the Portage. Invasions of the Mississippian sea occurred to the northeastward and at another time of the Atlantic sea into the Mississippian basin by way of certain channels in central New York. These invasions and temporary connections are shown by a mingling and migration of the different faunas.

Glacial Geology.—As work in glacial geology has progressed in the central and western States, the evidence pointing to several advances of the continental ice-sheet, separated by inter-glacial intervals, has become continually stronger, and the various till sheets have been carefully mapped and studied as far east as Illinois. In the eastern States evidence of an equally positive character has been lacking, although recently accomplished work points in that direction. During 1902 there appeared the results of Leverett's work in Ohio (Monograph 41, United States Geological Survey), a region whose glacial history has been discussed by many prominent geologists, including Newberry, Orton, Gilbert, Wright, Chamberlin, and Taylor. Leverett has found evidence of eleven epochs, or stages, of the glacial period as follows: (1) The oldest recognized glaciation, the sub-Aftonian of Chamberlin; (2) the Aftonian interval of recession of the ice-sheet; (3) the Kansan stage of glacial re-advance; (4) the second or Yarmouth interval of recession; (5) the Illinoian re-advance; (6) the third or Sangamon recession; (7) the Iowan re-advance, the deposition period of the loess; (8) the fourth or Peorian recession; (9) the early Wisconsin stage of re-advance with the formation of four successive systems of marginal moraines; (10) the fifth interval of glacial retreat; (11) the late Wisconsin of mainly continued retreat, with ten sub-stages of halt or slight re-advance, which was marked by a series of marginal moraines and changes of the glacial lakes that finally occupied the Erie and Ontario basins.

Much interest and not a little excitement was created by the discovery in April, 1902, of human bones in a loess-like deposit at a point two miles southeast of Lansing, Kan. The discovery was made by two farmers who were digging a cellar. The great value of this discovery lay in the possibility of its being the remains of prehistoric man, one who existed even before the close of the glacial period. The bones were found in the loess near its contact with an underlying limestone, and close to a small stream valley, tributary to the Missouri River at that locality. The level of the tunnel is twelve feet above the highest point reached by the river during the flood of 1881. Certain geologists, including N. H. Winchell, who first examined the remains, came to the conclusion that the loess was a glacial deposit and that the bones had been entombed at the beginning of the deposition of this material, which would refer it to the Iowan stage of the glacial period, when the ice had receded from this region but still covered the northern part of the country. They considered therefore that the Lansing skeleton was of late glacial stage, and probably twice or perhaps three times as ancient as the traces of man which have been found in the gravels at Trenton, N. J., and at Little Falls, Minn. These views, however, are not shared by all the glacial geologists who examined the locality and Professor Chamberlin who also studied the occurrence in some detail considers that the most conservative and probable view is that the loess-like deposit in which the bones were

found, does not belong to the extensive loess-sheet of the Iowan stage as claimed by some, but that it represents a mixture of flood-plain material, soil washed from higher slopes, blown sand, and delta-material, the beginning of this entire accumulation dating back to a time when the Missouri River bed was at the level of the limestone underlying the tunnel. Since then the river has cut down its channel twenty-five feet. The antiquity of the burial is measured, therefore, by the time taken by the Missouri River to lower its bottom, which is two miles or more in width, from 15 to 25 feet. This undoubtedly represents a considerable time, but falls far short of the close of the glacial invasion. As Chamberlin has pointed out, evidence of man's presence in the glacial period should be sought for in the interglacial deposits rather than in fluvial deposits of glacial rivers, since there is liability of these to undergo the great overworking by the scour and fill process so common in all rivers. See *ARCHÆOLOGY, AMERICAN* (paragraph Human Antiquity).

Economic Geology.—In 1902 various papers, already published by Van Hise, Kemp, Weed, Emmons, Lindgren, and others, appeared in bound form under the title of *Genesis of Ore Deposits*. The book makes a remarkable showing, and represents well the great advance that has been made in our knowledge of the genesis of ores during the past ten years in America, as well as being an excellent summary of present views. One notable feature is that for the first time the results of recent investigations of physical chemistry are being applied to problems in the genesis of ores. The secondary enrichment of ores by descending waters is brought out somewhat fully by Rickard and Weed, and the latter now finds that it may also be caused by ascending alkaline waters, similar to those of the Yellowstone Park. This might occur in the case of primary quartz pyrite veins that had been reopened by later fracturing, and the alkaline waters, ascending through these fissures and coming into contact with the primary pyrite, would deposit metallic sulphides because the pyrite acted as a reducing agent. This point has been recently verified by actual experiment. Weed has also classified and defined a type of ore deposits known as the contact metamorphic type, showing that it is characterized by a gangue consisting essentially of garnet, epidote, actinolite, and other lime-alumina silicates. Under this type it is found possible to group two classes, namely (1) copper deposits found at the actual contact with intruded rocks and known as the Kristiania type, and (2) deposits in sedimentary strata which have been altered by contact metamorphism, and in which the ore is confined to one bed. This is known as the Cananea type. These two classes of copper deposits are, however, to be distinguished from those of similar geological structure and occurrence in which free gold and tellurides of gold and bismuth and highly auriferous pyrite are the only ore minerals. These deposits are all connected genetically with igneous intrusions, either structurally in the formation of ore channels or by the deposition of ore by a pneumatolytic or solfataric action; but the new fact shown is that thermal metamorphism effects marked physical changes in the contact zone of sedimentary rocks, the result of this being that certain strata are made porous, while others are relatively impervious. Furthermore, the gases and vapors given off by the covering igneous magma, as well as the circulating waters of the later phase, penetrate these porous rocks and deposit metallic sulphides and tellurides.

GEORGE, King of Saxony, succeeded to the throne on the death of his brother Albert (*q.v.*), June 19, 1902. He is the second son of King John, who reigned from 1854 to 1873, and Queen Amalie, daughter of King Maximilian I. of Bavaria, and was born August 8, 1832. On May 11, 1859, he married the Infanta Maria Anna, daughter of King Ferdinand of Portugal. She died in 1884. He served under his brother Albert, then crown prince, who commanded the Saxon forces in the Austro-Prussian war of 1866, and participated in the decisive battle of Königgrätz on July 3 of that year. He served also in the Franco-Prussian war, in which he distinguished himself at Gravelotte and Sedan.

GEORGIA, a southeastern State of the United States, has an area of 59,475 square miles. The capital is Atlanta. Georgia was one of the original thirteen States. The population in 1900 was 2,216,331, while in June, 1902, as estimated by the government actuary, it was 2,298,000. The populations of the three largest cities in 1900 were: Atlanta, 89,872; Savannah, 54,244; and Augusta, 39,441.

Finance.—The balance in the treasury September 30, 1901, was \$730,722.10. The receipts for the fiscal year 1901-02 were \$3,886,163.21, and the disbursements \$4,105,705.10, leaving a balance in the treasury September 30, 1902, of \$511,180.21. Of the receipts, \$2,123,612.13 were derived from the general tax; \$147,493.78 from the liquor tax; \$272,448.94 from the poll tax; \$274,614.61 from the railroad tax; \$420,012 as the annual rental from the Western and Atlantic Railroad; and \$150,000 from the temporary loan of 1902. The bonded indebtedness of the State on September 30, 1901, was \$7,731,508, and of this amount the regular annual installment of \$100,000 was paid on January, 1902, leaving a net bonded indebtedness of \$7,631,508.

Agriculture and Industries.—Agricultural interests in Georgia were not so prosperous in 1902 as usual. There were 3,899,331 acres planted in corn, which yielded 35,093,979 bushels, with a value of \$25,618,605. The season for winter wheat was poor. The acreage was 284,531 acres according to the *Crop Reporter*, which was far below the figures (319,161 acres) for 1899 given by the Twelfth Census. The yield for 1902 was given as 1,707,186 bushels valued at \$1,673,042. According to the above authorities, the acreage of oats declined between the same years from 318,433 to 264,013 acres. The production for 1902 was 2,930,544 bushels, valued at \$1,553,188, considerably below the average crop. The statistics seem to show an even greater decline in the growth of hay. The census figures show 130,253 acres of hay in 1899, while the statistics of the Department of Agriculture for 1902 give 88,080. The yield was 110,789 tons; the value, \$1,605,173. Potatoes and sweet potatoes were average crops. Tobacco was conspicuous as the one crop especially productive. The acreage was small (2050 acres), but the yield was 670 pounds per acre—the three preceding crops averaging only 475 pounds. Cotton yielded 165 pounds of lint cotton per acre—considerably below the average. Rice yielded 31 bushels per acre. The cotton manufacturing industry continued to prosper during 1902, five new cotton mills were erected and much new capital was invested in enlargements and improvements during the year.

The total railroad mileage in the State July 1, 1901, was 5816.80—an increase of 201.92 miles during the year. The gross earnings for the year were \$23,246,225.42. The operating expenses were \$16,383,652.23, or 70.48 per cent. of the gross earnings, leaving \$6,862,573.19 as net earnings. The average net earnings per mile of road in the State were \$1244.57.

Legislation.—Among the acts passed during the 1902 session of the legislature, one of the most important was that providing that if an employee of a corporation dies, wages due him not exceeding \$100 may be paid to his widow or minor children without administration on his estate. The child-labor bill, advocated vigorously by philanthropists and reformers both North and South, failed to pass. This was a hard blow to the movement for factory legislation, as neighboring States will urge that it would be unfair to hamper mill owners within their own borders by such restrictive legislation, when Georgia offers a free field for the exploitation of infant labor. Such legislation would, it is alleged, merely drive mills to Georgia.

Political.—The contest for the governorship in 1902 was unusually interesting, because of the prominence of the two leading candidates. Mr. Joseph M. Terrell, the successful candidate, who resigned the position of State attorney-general to enter the contest, had held that office for ten years. The primaries, in Georgia, practically decide the contest, as all candidates are usually Democrats. Mr. J. H. Estill, of Savannah, who received the second highest vote, is the editor and proprietor of the *Savannah Morning News* and a veteran of the Civil War. The prohibition question was the most prominent issue in the November gubernatorial campaign. The liquor law of the State provides for local option, and 120 out of 139 counties are under prohibitory laws. After the convention of the regular Democrats, Mr. Dupont Guerry declared himself a Democratic candidate for governor, having for his platform the prohibition of the sale of liquor on the plan adopted in Maine. By this action he expected to influence the Democratic vote successfully against the 19 "wet" counties of the State or to drive the Prohibitionists of the 120 "dry" counties into direct opposition to the regular Democratic party. His expectations were not fulfilled.

Conventions and Platforms.—The Democratic State Convention was held at Atlanta on July 2, 1902. The platform favored equal rates of taxation for all kinds of property subject to taxation; the encouragement of enterprise in the State; the authorization of the Interstate Commerce Commission to revise railroad rates on inter-state shipments, and revision of the public school laws in order to secure a more satisfactory common-school system. Temperance work was touched upon in its connection with politics as follows: "We do not believe the cause of temperance should be made a political issue in this State. The best interests of the people, as well as the furtherance of that cause, demand a complete separation of this question from personal and party politics." The platform referred in terms of commendation to the attitude of the United States senators and representatives from Georgia regarding trusts, the colonial policy of the government, and the ship subsidy bill. It was urged that tariff protection be removed from all articles controlled by trusts or similar combinations.

The Gaynor-Greene Case.—For conspiracy to defraud the national government in collusion with Capt. Oberlin N. Carter during the progress of work for improving the harbor of Savannah, John F., Thomas H., and William T. Gaynor and Benjamin P. Greene were summoned to appear for trial at Savannah on February 11, 1902. On their arraignment, John F. Gaynor and Greene were bailed in \$40,000 each, and an adjournment was granted until March 17. On March 6, the defendants were

called upon to answer to new indictments. It was then revealed that Greene and John F. Gaynor had taken flight to Quebec. Their bonds were ordered estreated. The two men were subsequently arrested in Quebec on May 20, and placed in confinement. Their extradition was fought for but not secured. See CANADA, DOMINION OF (paragraph Gaynor-Greene Extradition Case).

Elections.—At the regular biennial State election, held October 1, 1902, a full Democratic State ticket was elected. The vote for governor was Terrell (Dem.), 81,548; and Hines (Pop.), 5566, giving Terrell a plurality of 75,982. The legislature of Georgia met October 22, 1902, and re-elected Alexander Stephens Clay as United States senator for the full term of six years beginning March 4, 1903. The State legislature for 1903 will be composed of 40 Democrats, 2 Republicans, and 2 Populists in the senate, and 171 Democrats, 3 Republicans, and 1 Populist, in the house.

State Officers for 1902 and 1903.—Governor, Joseph M. Terrell, elected for two years, term ending November, 1904; secretary of state and ex-officio surveyor-general, Philip Cook; comptroller and ex-officio commissioner of insurance, W. A. Wright; adjutant-general, James W. Robertson; attorney-general, John C. Hart; State school commissioner, W. B. Merritt; commissioner of agriculture, O. B. Stevens; State treasurer, R. E. Park—all Democrats.

Supreme Court: Chief justice, T. J. Simmons; associate justices, Samuel Lumpkin, W. A. Little, W. H. Fish, A. J. Cobb, and Spencer R. Atkinson—all Democrats.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA, established in 1840, is a type of the State Church of Prussia, which represents a union of Lutheran and Reformed elements. The church, strongest in the central and north central States, is gaining steadily, its membership in 1902 being 209,156, an increase of more than 3800 for the last year, with 949 ministers and 1179 congregations. Seventeen districts are comprised in the synod. Its Sunday-schools have 111,788 scholars, and its parochial schools 24,541 pupils. The higher institutions of learning under the control of the denomination include a proseminary at Elmhurst, Ill., and a theological school, Eden Theological College, at St. Louis, Mo. Foreign missions are conducted in India, the field being organized into 4 stations and 45 out-stations, and employing 9 men missionaries and 5 women missionaries, besides several native workers. Some 2650 acres of land are held in connection with the foreign mission work. In the domestic field, there are 92 missions with 78 workers, a notable department of this activity being the Emigrant and Harbor Mission in Baltimore, Md. The German Evangelical Synod has headquarters in St. Louis, the location of the Eden Publishing House, and is represented officially by *Der Friedensbote*, a weekly, the circulation of which is more than 26,000. The report of the treasurer of the Synod for 1902 shows receipts and expenditures, respectively, of \$62,843 and \$61,949. A general conference of the Synod is held every three years, the last having been in 1901 in St. Louis. President, Rev. J. Pister; secretary, Rev. E. Fuhrman, 404 Lafayette Street, Newark, N. J.

GERMAN METHODIST CHURCH. See EVANGELICAL ASSOCIATION.

GERMAN REFORMED CHURCH. See REFORMED CHURCH IN THE UNITED STATES (GERMAN).

GERMAN SOUTHWEST AFRICA, a German protectorate on the South Atlantic between Angola and Cape Colony, has an estimated area of 322,450 square miles and an estimated population of 200,000. The protectorate is administered by an imperial commissioner stationed at Windhoek. There is a military force which includes natives and about 800 Europeans. For the fiscal year 1903 the estimated revenue (including an imperial contribution of 7,634,000 marks) and expenditure balanced at 9,458,900 marks. (The mark is worth 23.8 cents.) A large part of the country is barren and there is little agriculture; the chief industry is the raising of cattle, sheep, and goats. Various metals have been found, but mining is undeveloped. The imports and exports in 1900 were valued at 6,968,385 marks and 987,565 marks respectively; in 1901 about 10,000,000 marks and 1,250,000 marks respectively. In the latter year the chief imports, largely of German origin, were railway materials, bridges, cement, lumber, beer, and coal. The export increase in 1901 was chiefly guano, which in 1900 amounted to 610,000 marks; this industry is almost wholly controlled by an English establishment in Cape Town. The export of ostrich feathers is increasing in importance. In 1902 the railway from the port of Swakopmund to Windhoek was completed, and on June 20 was formally opened to traffic. This rather indirect line is 381 kilometres (237 miles) long and was built at a

cost exceeding \$3,000,000. The construction of a harbor at Swakopmund will cost an additional \$500,000. It was expected that the receipts of the railway would cover only the working expenses, leaving no margin for interest on capital. The anti-colonial press in Germany, remarking that in 1902 there were only 2223 Germans in the protectorate, that agriculture is practicable only in the north, and that the yearly exports have never exceeded \$350,000, took a gloomy view of the prospects of the road.

GERMANY, an empire of central Europe consisting of twenty-five states and the imperial provinces of Alsace and Lorraine. The capital is Berlin.

Area and Population.—The empire comprises four kingdoms, six grand duchies, five duchies, seven principalities, three free towns, and two imperial provinces. The total area is 208,830 square miles. The census of December 1, 1890, showed a population of 49,428,470, and that of December 1, 1900 (final figures), 56,367,178, of whom 27,737,247 were males and 28,629,931 females. According to the latter census there were 55,587,642 German subjects, 778,698 foreigners, and 838 of unknown status. Among the foreigners were 371,022 Austrians, 88,053 Dutch, 69,760 Italians, 55,456 Swiss, 46,971 Russians, and 17,848 Americans. There were 51,883,131 persons reporting German as their mother tongue, 4,231,129 some foreign language, and 252,918 German and a foreign language. The second class included 3,328,751 persons speaking Polish (including Massovian and Cassubian), 223,551 French (including Walloon), 141,061 Danish, 107,398 Czechish (including Moravian), and 106,305 Lithuanian. In the third class were 182,184 persons reporting German and Polish (including Massovian and Cassubian). As to religion the census of 1900 showed 35,231,104 Protestants, 20,321,441 Roman Catholics, 210,150 other Christians, and 586,948 Jews. There were 625 Protestants per thousand inhabitants, 361 Catholics, 10 Jews, and 4 of other religious proclivities. In the ten-year period, 1890-1900, the Protestants increased 13.6 per cent., the Catholics 15 per cent., and the Jews 3.4 per cent. Final figures for the largest cities are: Berlin, 1,888,848; Hamburg, 705,738; Munich, 499,959; Leipzig, 456,124; Breslau, 422,709. There were 33 cities of more than 100,000 population. Emigrants numbered 116,339 in 1892, 22,309 in 1900, and 22,073 in 1901. In the period 1892-1901 the total emigration amounted to 431,859, of whom the majority went by way of Bremen and Hamburg, and nearly six-sevenths came to the United States.

Government.—The chief executive authority rests with the King of Prussia under the title of "German Emperor"; William II., the present emperor, was enthroned in 1888. The heir-apparent is Prince Frederick William, born in 1882. The imperial ministers, appointed by the emperor, do not form a single body (cabinet), but carry on the work of their departments independently; all, however, are under the supervision of the imperial chancellor, who unlike them is not responsible to the imperial legislature. This is a bicameral body consisting of an upper house, or Bundesrath, which is presided over by the chancellor, and a lower house, or Reichstag. Members of the former (58) are appointed by the governments of the several states, and those of the latter (397) are elected by popular vote. The emperor convokes these bodies annually and has no veto on the laws enacted by them; without their knowledge or consent, however, he may exercise certain functions affecting the empire internationally, such as declaring war for defense, making peace, and concluding certain kinds of treaties. In 1902 the imperial chancellor and minister for foreign affairs (and president of the Prussian ministry) was Count Bernard von Bülow (appointed October, 1900); secretary of state for foreign affairs, Baron von Richthofen; secretary of state for the interior, Count von Posadowsky-Wehner.

Army and Navy.—The military forces of Germany are under command of the emperor. There is no imperial war office, but for this purpose the Prussian war office serves, while there are separate war ministers for the kingdoms of Bavaria, Saxony, and Württemberg, whose sovereigns, particularly the King of Bavaria, have considerable latitude in the management of their respective armies. Throughout the empire all Germans capable of bearing arms are liable to service in the army or navy for at least six years. The imperial army on a peace footing in 1901 numbered 24,145 officers and 580,023 men; in 1902, 24,292 officers and 581,519 men. The estimated strength on a war footing is over 3,000,000 trained men. Exclusive of the cost of the expedition to eastern Asia, the military appropriations in 1901 amounted to 673,655,570 marks, and the military budget for 1902 664,586,730 marks. See *MANCEUVRES, MILITARY AND NAVAL*.

A law dated June 14, 1900, provides that by 1916 the navy, exclusive of torpedo boats, special service vessels, gunboats, and training ships, shall comprise 38 battleships and 14 large and 38 small cruisers. From the rapid progress made in carrying out this programme, it appeared in 1902 that the battle fleet would be completed in 1908, and construction after that date would be merely the replacing of old

vessels, the age limit of which is twenty-five years. Exclusive of transports and old and non-effective vessels, the launched ships of the navy in February, 1902, were reported to comprise 10 first-class battleships, 5 second-class battleships, 8 old battleships, 2 armored cruisers, 16 protected cruisers, 19 coast-defense ships, and 177 torpedo boats, torpedo gunboats, and destroyers. Vessels recently launched include the first-class battleship *Schwaben*, 11,800 tons, August 19, 1901; first-class battleship *Mecklenburg*, 11,800 tons, November 9, 1901; armored cruiser *Prince Frederick Karl*, 8868 tons, June 21, 1902; protected cruiser *Frauenlob*, 2700 tons, March 22, 1902; protected cruiser *Arcona*, 2700 tons, April 22, 1902. The naval complement for 1901 numbered 31,038, of whom 1283 were commissioned officers; similar figures for 1902 were 33,408 and 1394.

Finance.—The monetary standard is gold and the unit of value the mark, worth 23.8 cents. The largest source of imperial revenue is customs. Deficits are made up by assessments on the several states, levied in proportion to population. The largest expenditures are on account of war and finance. The total revenue and expenditure in marks, according to the budget estimates, have been as follows for years ending March 31:

	1900	1901	1902	1903
Revenue.....	1,973,115,000	2,186,395,000	2,311,980,000	2,304,483,115
Expenditure.....	1,960,591,000	2,217,122,000	2,344,686,000	2,306,325,683

The budget submitted for the fiscal year 1904 balanced at 2,464,972,734 marks, but the estimated revenue included 219,921,739 marks to be raised by a loan. According to the budget for the fiscal year 1903, there would accrue from customs, 483,651,000 marks; from posts and telegraphs, 440,629,130; from excise, 335,432,690; stamps, 94,598,000; railways, 89,785,500; and federal contributions, 580,639,792. In this last class the assessment of Prussia was 355,497,405 marks; Bavaria, 63,144,874; Saxony, 43,326,266; Württemberg, 22,279,423; Baden, 19,263,181; Alsace-Lorraine, 17,732,564; and Hesse, 11,548,995. The largest expenditures (ordinary and extraordinary) shown in the 1903 budget were for the imperial army, 653,726,800 marks; the imperial treasury, 564,263,000; posts and telegraphs, 420,349,192; imperial navy, 217,038,089; imperial debt, 93,654,160; pensions, 74,494,701. For the fiscal year 1903 the Prussian budget balanced at 2,614,167,144 marks. Considerable difficulty has been experienced of late by both imperial and Prussian finance ministers to maintain budget equilibrium. In 1902 the imperial debt amounted to 2,295,667,700 marks; in addition there was a non-interest bearing indebtedness of 260,000,000 marks and outstanding imperial treasure bills aggregating 120,000,000 marks—total debt, 2,675,667,700 marks. The combined indebtedness of the several German states is about 11,000,000,000 marks.

Industries.—The fact that Germany has been transformed from a distinctively agricultural to an increasingly industrial country has not only brought into prominence the question of the nation's food supply, but, over the question of the tariff, has intensified the strife between farming interests on the one hand and manufacturing interests on the other, a strife that is as irreconcilable as it is inevitable. The very great transfer of productive labor from agriculture to industries has resulted in an overproduction of many kinds of merchandise, but an underproduction of food materials. The depression in the manufacturing industries, which began in 1900, was still keenly felt at the end of 1902. During these years the iron and steel industries, the condition of which has come to be regarded as a fairly good criterion of prosperity among an industrial people, suffered heavy losses which were far-reaching in their disastrous effects. The depression among other industries was less, but a comparison of the average dividends paid by joint-stock and limited-liability companies in 1900 and 1901 is of interest.

	1900	1901		1900	1901
	<i>Per Cent.</i>	<i>Per Cent.</i>		<i>Per Cent.</i>	<i>Per Cent.</i>
Earthenware, glass, and porcelain.....	13.64	12.41	Paper mills.....	10.96	8.13
Chemical manufactures.....	11.24	10.41	Electrical machinery and supplies.....	9.55	5.79
Breweries and distilleries..	10.09	9.39	Textile manufactures.....	4.58	3.18

Official returns in metric tons (2204.6 pounds) for some of the leading German crops in 1900 and 1901 are: Potatoes, 40,585,317 and 48,687,261 respectively; rye, 8,550,659 and 8,162,660; oats, 7,091,930 and 7,053,153; wheat, 3,841,165 and 2,498,851; barley, 3,002,182 and 3,321,102. The estimated amounts of the principal minerals raised in 1900 and 1901 are reported, in metric tons, as follows.

	1900	1901		1900	1901
Coal.....	109,290,237	108,417,029	Kainite and other potassium minerals.....	3,050,631	3,537,074
Lignite.....	40,498,019	44,211,902	Copper ore.....	747,749	777,339
Iron ore.....	18,964,294	16,570,258	Lead ore.....	148,257	153,340
Zinc ore.....	639,215	642,496	Rock salt.....	926,563	985,919

In 1899 the value of minerals raised was 1,052,000,000 marks, and in 1900 1,262,000,000 marks. As indicated above, the iron and steel industries in Germany have not been prosperous during the last few years. In 1900 the production of pig iron amounted to 8,494,852 metric tons, valued at 549,100,000 marks, or \$15.38 a ton; in 1901 the output fell to 7,835,204 tons and the value to 488,700,000 marks, or \$14.85 a ton. The production of other metals in 1900 and 1901 respectively was: Zinc, 155,790 metric tons and 166,283 metric tons; lead, 121,513 and 123,098; copper, 30,929 and 31,376; silver, 415,735 kilogrammes and 403,796 kilogrammes; gold, 3055 kilogrammes and 2755 kilogrammes. The values in marks of pig iron products in 1900 and 1901 respectively were: Cast iron, 333,400,000 and 262,700,000; wrought iron and steel, 173,800,000 and 117,800,000; iron and steel ingots, 953,000,000 and 796,700,000. In the summer of 1902 a powerful syndicate was formed for the purpose of paying bounties on exports of iron and steel. These bounties would equal the difference between the current price in the German market and the price actually obtained abroad. Exports of iron and steel would thus be sustained at the expense of home consumers.

Commerce.—The special trade (that is, the foreign commerce exclusive of goods in transit through Germany) of the *Zollgebiet*, or customs territory, which embraces practically all the empire, has been in marks as follows:

	1898	1899	1900	1901
Imports.....	5,439,676,000	5,783,628,000	6,042,992,000	5,710,388,000
Exports.....	4,010,565,000	4,368,409,000	4,752,601,000	4,512,646,000

Included in these figures are specie and bullion, valued in marks as follows:

	1898	1899	1900	1901
Imports.....	359,030,000	300,582,000	277,378,000	289,103,000
Exports.....	253,999,000	161,360,000	141,220,000	81,198,000

Imports from and exports to (special trade) the countries of greatest commercial importance are stated in marks as follows for 1900 and 1901:

	Imports from—		Exports to—	
	1900	1901	1900	1901
United States.....	1,090,764,000	1,042,100,000	439,653,000	385,800,000
Russia and Finland.....	729,510,000	729,500,000	359,033,000	345,900,000
Austria-Hungary.....	724,332,000	693,300,000	510,730,000	491,500,000
Great Britain.....	840,661,000	687,800,000	312,219,000	310,400,000
France.....	305,500,000	281,800,000	277,600,000	249,900,000
British India.....	224,714,000	214,800,000	69,948,000	75,500,000
Netherlands.....	215,379,000	203,800,000	398,888,000	379,000,000
Argentina.....	234,600,000	200,800,000	64,000,000	54,200,000
Belgium.....	220,507,000	186,500,000	253,105,000	236,000,000
Switzerland.....	170,505,000	154,200,000	292,054,000	264,300,000
Brazil.....	115,500,000	113,900,000	45,700,000	35,500,000
Australia.....	122,200,000	107,900,000	47,900,000	52,200,000
Chile.....	89,400,000	100,700,000	39,900,000	34,000,000

The leading imports in 1901 were valued in marks as follows: Cereals, 658,500,000; cotton, 316,400,000; wool, 287,400,000; woollen yarn, 82,900,000; skins and hides, 228,300,000; wood, 193,300,000; coal, 177,000,000; cattle, 154,700,000; coffee, 148,700,000; seeds, plants, etc., 136,900,000; silk, 132,000,000; fish, 116,600,000; leaf tobacco, 112,300,000; eggs, 104,800,000; petroleum, 92,000,000; nitrate of soda (from Chile), 90,000,000; iron, 88,600,000; copper, 87,500,000; fats, 85,100,000. Among the principal exports in 1901 were: Chemicals, colors, drugs, etc., 362,000,000 marks; iron and steel wares, 283,200,000; coal, 262,600,000; drugs, etc., 234,700,000; iron, 214,000,000; cotton cloth, 219,800,000; woollen goods, 212,600,000; woollen yarn, 56,300,000; sugar, 203,300,000; machinery, 187,400,000; haberdashery, 183,000,000; silk tissues, 137,300,000; clothing, 133,400,000; colors, 127,100,000; skins and hides, 120,600,000; paper, 103,800,000; engravings and pictures, 96,900,000; leather, 80,000,000. In the first half of 1902 imports amounted to 2,840,000,000 marks, an increase of

88,170,000 marks as compared with the corresponding period of 1901; the exports were valued at 2,286,700,000 marks, an increase of 150,700,000 marks.

During the last few years, marking an unprecedented depression in German home markets, it was the country's firmly established export trade that sustained many of her industrial and commercial establishments. It is interesting to note that Germany's highest adverse balance of trade developed during 1898, 1899, and 1900, "the three years when the trade activity of the country was at its zenith."

The imports of the leading cereals in metric tons in 1901 and the excess of imports over exports are stated as follows: Wheat, 2,306,386 and 2,068,219; corn, 1,210,683 and 1,197,556; barley, 917,641 and 873,346; rye, 887,190 and 782,042; oats, 476,012 and 252,385; wheat flour, 40,884 and 10,222. These figures, which in connection with those of previous years show that the excess of cereal imports over exports is steadily increasing, lead to the conclusion that under existing agricultural conditions Germany will continue to be unable to produce her own food supply.

Communications.—In 1902 the total length of the German railways was 52,982 kilometres, of which 47,553 kilometres were government lines and 5429 kilometres were private lines. Length in kilometres of the government-owned railways in the most important states was as follows: Prussia and Hesse, 31,483; Bavaria, 5889; Saxony, 3027; Württemberg, 1896; Alsace-Lorraine, 1733; Baden, 1634; Mecklenburg, 1106. In 1901 there were in the empire 131,011 kilometres of telegraph lines, with 483,542 miles of wire. The telegraph offices numbered 25,621, and post-offices 37,807.

HISTORY.

The sittings of the imperial legislature in 1902 were a part of the second session of the Reichstag elected for the five-year period June, 1898–June, 1903. On October 1, 1902, the 397 deputies comprising the Reichstag were divided into party groups as follows: Clerical Centre, 102; Social Democrats, 58; Conservatives, 52; Free Conservatives, 20; National Liberals, 53; Advanced Radicals, 27; Moderate Radicals, 14; Poles, 14; other groups and unaffiliated deputies, 57. These various groups in general may be said to form two great factions: the one, conservative, oftentimes reactionary, and leaning towards the Agrarian policy; the other, liberal, industrialistic, and even socialistic. Owing to the overrepresentation of the rural districts the groupings in the Reichstag are not a fair criterion of the voting strength of the several parties; for instance, in the 1898 election the Social Democrats cast about 2,120,000 votes, while the Clericals cast only 1,333,000. In 1902 the Reichstag re-assembled January 8 and adjourned June 11; sessions were again begun on October 14 and adjourned just before the Christmas holidays. The leading topics of 1902 are treated in the following paragraphs.

The Tariff Bill.—The most important topic under discussion in the Reichstag during 1902 was the new tariff bill introduced by Chancellor von Bülow December 2, 1901, and referred to a committee of the Reichstag. The measure was a distinct concession to the Agrarians, whose demands, however, its provisions did not fully satisfy. The bill, therefore, met with two-fold opposition from the very beginning. It was assailed by the Social Democrats and by the Radicals, who represented in this instance, however, more than their own parties and acted really as spokesmen for the industrial interests which were seriously threatened by the increased scale of duties imposed by the new bill on food-stuffs and animal products. On the other hand, a coalition of the Agrarian party, the Catholic Centre, and the National Liberals (the last of whom were severely taken to task by the press of their own party for deserting to the enemy) demanded an increased scale of duties amounting virtually to a prohibitive tariff. This, the government, however much in sympathy it might be with the general tenets of the conservative parties, could not concede without destroying the possibility of renewing a number of important commercial treaties with several countries, which would expire in 1903. The Agrarian interests secured a majority in the committee and proceeded to substitute for the government proposals, a scale of their own. The contest between the government and the committee centred about the tax on cereals. The government measure provided for a minimum impost of 5.5 marks per 100 kilogrammes on wheat, 5 marks on rye and oats, and 3 marks on barley. The committee scaled the rates up to 6 marks on wheat and 5.5 marks on rye, barley, and oats. Duties were also imposed on fruits, vegetables, plants, and flowers. The duty on live animals was raised from 10 or 12 to 18 marks per hundred kilogrammes, on butter and cheese from 20 to 30 marks, on eggs from 2 to 20 marks. The tax on the various commodities was aimed directly against the neighboring countries and the United States. Russia would be a sufferer from the increased duties on rye and animal products, Austria-Hungary would be deprived of a market for barley, while the tax on fruits and plants would destroy a great part of the Italian trade. The United States would suffer in its cereal and meat trade. The government duties on manufactures were left practically intact. By the majority of the

people the measure was regarded with extreme dissatisfaction as marking a step backwards in the industrial evolution of Germany, and it was pointed out that in sacrificing the industries of the country, on whose growth the future of Germany largely depends, to the decaying agricultural interests, the government was merely making a bid for the support of the Conservative parties in carrying out its ambitious military and naval policy. The press of the country assailed the measure while it was still in committee, and on May 12, 1902, a meeting of 700 representatives of the chief municipalities at Berlin protested vigorously against the bill as inimical to the interests of commerce and industry. The discussion of the 946 articles of the measure proceeded very slowly in committee, and it was only on October 2 that it concluded its labors. On October 16 the Reichstag began the second reading of the bill. The government from the first was in a dilemma. It was confronted by the almost solid opposition of the Social Democrats, of the Radicals, and of the Conservatives, though these were actuated by different motives. The Social Democrats, in fear of any coalition that might make possible the passage of the measure, declared their intention of killing it by obstruction, and maintained that in view of the general opposition to the bill its enactment would be a flagrant breach of the principle of representation on the part of a Reichstag whose days were rapidly drawing to a close. For a time the government was helpless while a parliamentary battle marked by great animosity was waged by the Agrarians and Social Democrats, the latter sincerely opposed to the bill but still mindful of the opportunity of making political capital for the coming elections; the former merely biding their time until the government should be forced to make terms. Secret negotiations went on for months between Chancellor von Bülow and the leaders of the Conservative parties and resulted finally in a compromise by which the Agrarians obtained practically all their demands except in the case of the tax on barley imported for brewing purposes, which was allowed to stand at 3 marks. This was a concession to the Bavarian brewing interests. According to general opinion the emperor's influence was responsible in large measure for the coalition, and the support of the Clerical Centre was purchased, it was asserted, by the promise of liberal favors to Catholic interests. Formal announcement of the coalition was made on November 14, 1902, when it was moved by the Conservatives and carried that the Reichstag in voting should proceed by ballot instead of by roll call. This was done to overcome the tactics of the Social Democrats, who by forcing a division on every question, succeeded in delaying action. Progress, however, was still slow, and a resolution was introduced by Baron Kardorff on November 27, providing that the bill be voted on as a whole instead of by paragraphs. This aroused stormy debates in the Reichstag, in the course of which Herr Singer, one of the socialist leaders, was suspended. On November 28 the Reichstag adjourned till December 9. On December 11 the Kardorff resolution was adopted, and on the 14th the entire bill was passed by a vote of 202 to 100. On the 18th the bill was passed by the Bundesrath. The action of the majority in violating parliamentary precedent and in resorting to what practically amounted to gag rule aroused violent criticism throughout the country. In an article contributed to a liberal paper of Berlin, the venerable Professor Theodor Mommsen declared that the enforcement of the gag rule was the beginning of a *coup d'état* "by which the emperor and the Reichstag are to be subjected to the absolutism of an alliance between the Junkers and the priests."

Alsace-Lorraine.—On May 10, 1902, Emperor William issued an edict looking toward the repeal of the "dictator paragraph" in the fundamental laws of the empire, applying to Alsace-Lorraine. This article gave to the Staatthalter special dictatorial powers for public security, authorizing him to "adopt without delay in the event of danger to the public safety all measures that he considered requisite," and in particular permitting him to use the military garrison for police purposes, to suppress offending newspapers, and without warning to expel any inhabitant from the Reichsland. The "dictator paragraph" had always been a source of considerable irritation to the inhabitants of Alsace-Lorraine. It is well to point out, however, that the treatment accorded them by the imperial government has been in marked contrast to that received by the people of German Poland at the hands of the Prussian government. In the one case conciliation has prevailed; in the other, antagonism. Basically this difference is due to the inherent discordance between Teuton and Slav. The majority of the Alsace-Lorrainers are German in blood and language.

Colonies.—German colonial acquisition began in 1884. The colonies, or protectorates, as the government chooses to call them, are Togoland, Cameroon, German Southwest Africa, East Africa (German), New Guinea (German), Caroline Islands (with the Pelews and Mariannes), Samoa (German), Bismarck Archipelago (*qq.v.*), Marshall Islands, Solomon Islands (in part), and Kiao-Chau. The total estimated area is about 1,025,000 square miles and the estimated population about 12,800,000. According to an unofficial report the total number of Germans

in these colonies in 1902 was only 4956, most of whom belonged to the official and military classes; the other white population was about 2000. In general the trade, though small, is expanding, but the increase has not been in proportion to that of the imperial subventions required for colonial administration. In 1900 the total imports to and exports from the colonies (excepting Kiao-Chau) were valued at about 28,930,000 marks and 16,871,000 marks, respectively. None of the colonies is self-supporting; for the fiscal year 1903 the imperial contributions made to balance the budgets aggregated over 18,467,000 marks, exclusive of 12,168,000 marks for Kiao-Chau. In 1902 the colonial policy of the government continued to receive public criticism and parliamentary indifference, not to say disapproval; against it in the Reichstag stand the Liberal and socialist elements.

Sufficient interest, however, existed to make possible a colonial congress, which convened in Berlin on October 10, 1902. Careful consideration was given to pertinent colonial topics, including geography, ethnology, languages, sanitation, animal diseases, native labor, and the general betterment, from both the colonial and the imperial point of view, of Germany's dependencies. Though it was held that Germany is quite able to maintain a sufficiently strong fleet for the protection of the existing colonies, the sense of the congress was unfavorable to further territorial acquisition. Emphasis was laid upon the need of commercial development. Remedies were suggested for the better preservation of their own nationality among German emigrants throughout the world. Various reforms were recommended for some of the colonies, especially a methodical colonization of Southwest Africa; it was conceded, however, that the German colonies, where for the most part the climate is unfavorable to European residents, have very little to offer the German immigrant. Moreover, it must be admitted that most Germans leave their native country in order to better their economic condition and to escape from the conscription and other exactions of the imperial administration, none of which ends are effected by going to the German colonies. See BRAZIL (paragraphs on History).

Prussia. The Polish Question.—The ambition of the imperial government as well as of the Prussian is to "Germanize" the foreign ethnic elements of the empire—the Alsations, the Danes of Schleswig, and the Poles. To carry out this design in Prussian Poland, Bismarck conceived what has been called the policy of "internal colonization," that is, the purchase of Polish lands and their sale or rental to Germans. Prussian appropriations for carrying out this plan, between 1886 and 1902, aggregated about 209,700,000 marks. Nevertheless the Germanization of Prussian Poland did not progress very rapidly, and so further measures were taken by the government. These included the change of geographical names from Polish to German, and the establishment of German as the language of the courts and of the schools. In the case of the schools, however, Polish was tolerated in religious instruction, but when this was also taken away in 1901, Polish discontent became serious and culminated in the Wreschen episode in December, 1901, when Polish children were flogged for refusing to receive instruction in the German tongue. There were numerous public demonstrations against the Germans. At the end of 1901 the opinion prevailed that the Prussian government would turn to a course of conciliation, but this was shown to be incorrect when, at the opening of the Landtag, January 8, 1902, the prosecution of the Polish policy was voiced in the speech from the throne. On the 27th of the following May, Count von Bülow, as president of the Prussian council of ministers, introduced in the Landtag a bill for the strengthening of Germanism in the provinces of Posen and West Prussia. The bill provided for the appropriation of 250,000,000 marks, of which 100,000,000 marks were to be devoted to the purchase of Polish estates to be converted into crown domains and, in the case of waste lands, to be afforested. The remaining 150,000,000 marks were for the settlement of small German proprietors in the Polish provinces. The government held that the purpose of the measure was merely to prevent the Polish element from forcing back the German, though in the upper house it found apology in the charge that the Poles were preparing a separatist movement looking toward the reconstruction of the Polish kingdom. The Polish deputies, who after protest left the chamber in a body, held that the real object of the bill was the expropriation and impoverishment of the Polish population. Supported by the Conservatives and the National Liberals, the measure was enacted in July, 1902. Thus, from 1886, the total Prussian appropriations in the interest of Germanism in the Polish provinces amounted to about 459,700,000 marks. The 1902 measure provoked much bitterness, which was intensified by remarks of Count von Bülow and the German emperor. To an interviewer, early in June, the former, after declaring that German policy must be resolutely national, made an analogy much commented upon abroad and by the Poles much protested against at home: "If in this park I were to put ten hares and five rabbits, next year I should have fifteen hares and one hundred rabbits. It is against such a phenomenon that we intend to defend in Poland national unity."

About the same time King William, at the meeting of the Order of Teutonic Knights at Marienburg, took occasion to renew the charges against his Polish subjects and to speak with bitterness of "Polish arrogance" (Uebermuth). This angered not only the Poles of Prussia, but those of Russia and Austria, and it provoked in the Reichsrath an insulting outburst on the part of M. Klofac and other Radicals. The Polish question, indeed, came to be regarded as a factor of weakness in the Triple Alliance, but from the point of view of Prussia herself it was hardly expected to culminate in any serious disruption.

Public criticism of the German policy, as embodied in the law of 1902, represented divers points of view. Some held that the measure was unconstitutional, a view shared by Herr Richter, the Radical leader, who, however, was not in sympathy with the Poles. Others saw in it the beginning of state ownership of land in Germany, a point emphasized by the *Freisinnige Zeitung*, of Berlin. Many of the Catholics regarded it chiefly as a measure for the propagation of Protestantism, while the *Germania*, a Roman Catholic organ, opposed it not only on this ground but because of its alleged injustice to the Poles and unconstitutionality as well.

The Poles have set themselves steadfastly against "Germanization." In August, 1902, at a meeting of over 2000 Poles in Berlin, a resolution was adopted expressing a determination to "retain Polish land in Polish hands and to secure Polish education for Polish children." As stated above, the Prussian government has met with little real success in its policy. In many cases German settlers in the Polish provinces have become "Polonized," or, on account of uncongenial surroundings, have returned to their own districts. The Poles, moreover, have increased rapidly, not only in number but in thrift and education. Furthermore, there has been among them in the last quarter of a century a notable increase in the feeling of solidarity. Not more than twenty-five years ago much political bitterness existed between the Progressives and the Conservatives. The latter represented the old aristocracy and an almost fanatical Catholicism and still idealized the former kingdom of Poland. But, through various causes, the animosity between the two parties has been reduced to a minimum.

In the early part of September, Emperor William, accompanied by the empress, the heir-apparent, and the imperial chancellor, visited Posen, ostensibly for the purpose of dedicating a statue to the memory of Emperor Frederick III., but in reality to encourage the Germans in their struggle against the Poles. Extraordinary precautions were taken for the emperor's safety, and, in addition to hundreds of police, eight thousand infantry were present in the city. The royal entry was made amidst the wildest demonstrations on the part of the German inhabitants, but the Polish population abstained from any share in the celebration. All of the Polish nobility with but one exception, it was stated, left the city. The burgomaster's address of welcome had been carefully edited at Berlin and contained scarcely an allusion to the race question.

Other Events.—Considerable discussion was aroused by the action of Emperor William in connection with an incident in the internal politics of Bavaria. The Roman Catholic majority in the Bavarian chamber, which was at odds with the government over its attitude towards the appointment of a Catholic professor in the University of Würzburg, showed its resentment by refusing a vote of 100,000 marks asked by the prince regent for the purchase of certain valuable art collections. Following the action of the Bavarian chamber, Emperor William telegraphed to the prince regent, offering the necessary sum from his private funds and expressing in warm terms his indignation at the "ingratitude" shown by the diet to the "noble house of Wittlesbach." The offer was declined by the prince regent upon the ground that the money had already been secured. In Bavaria the emperor's action was severely condemned as an indication of the general tendency of the imperial government to intrude upon functions of the various members of the empire. The occurrence was of special significance in the case of Bavaria, which is still the least reconciled to the imperial constitution and Prussian leadership. German sentiment throughout 1902 was hostile to Great Britain. Early in January the British policy in South Africa was fiercely attacked in the Reichstag and Mr. Chamberlain was denounced in the most scathing terms. The comments of the press on the occasion of the emperor's visit to King Edward at Sandringham in November were also in line with this spirit. (For the Anglo-German alliance against Venezuela, see VENEZUELA.) On June 28 formal announcement was made of the renewal of the Triple Alliance (*q.v.*). On August 6 Emperor William met the Czar at Reval in the Baltic provinces.

GIBRALTAR, a rocky promontory commanding the entrance to the Mediterranean Sea is a British crown colony. It has an area of a little less than two square miles, and a population (1901) of 27,460, including a garrison of 5349 men. The governor and commander-in-chief in 1902 was Gen. Sir George Stuart White (since 1900). Revenue amounted in 1901 to £71,106 and the expenditure to £63,111. The

public debt is £19,253. Commerce is largely in transit and the port is free. A new harbor, dockyard, and coaling station are under construction at a cost of about £4,800,000. The actual present value of Gibraltar to Great Britain has been much questioned of late. A year ago a sensation was caused by a declaration in the House of Commons that the new docks and coaling mole, which the admiralty is constructing at enormous expense, were within the range of fire of Spanish batteries on an adjoining headland. More recently a French writer has declared that the fortress would be no longer capable of preventing the juncture of the French Northern and Mediterranean squadrons, and furthermore that the promontory has been so thoroughly undermined by the galleries and magazines with which it has been honeycombed, that the British engineers have advised against the repeated discharge of guns from the same side of the rock, and that, indeed, those of the largest calibre are allowed to be fired only one at a time.

GLADSTONE, JOHN HALL, an English scientist, died October 7, 1902. He was born in London, March 7, 1827, and received his education at University College, London, and under Liebig, at Giessen. Thereafter he devoted his time and means to investigation, and was recognized as one of the leaders in chemistry, physics, and kindred sciences. He became a fellow of the Royal Society in 1853, and published in its *Transactions* and in those of the Chemical Society the results of his researches extending over many years. The Davy medal of the Royal Society was awarded him in recognition of his optical and electrical discoveries. His services were frequently called into requisition in public works, as a member of the royal commission on lights, buoys, and beacons from 1858 to 1861, a member of the gun cotton commission of the war office from 1864 to 1868, Fulleren professor of chemistry at the Royal Institution from 1874 to 1877, first president of the Physical Society from 1874 to 1876, president of the Chemical Society from 1877 to 1879, and a member of the school board for London from 1873 to 1894. He published: *Life of Michael Faraday* (1872); *Spelling Reform from an Educational Point of View* (1878); *Chemistry of Secondary Batteries* (1883).

GODKIN, EDWIN LAURENCE, an American editor and publicist, died at Greenway, Devon, England, May 20, 1902. He was born at Moyne, County Wicklow, Ireland, October 2, 1831, and in 1851 graduated at Queen's College, Belfast. During the Crimean War (1854-56) he was correspondent in Turkey and Russia of the *London Daily News*. He visited the United States in 1856, made through the Southern States a horseback tour described in letters to the *News*, studied law in the office of David D. Field in New York City, and in 1859 was admitted to the bar. After some years of legal practice, he traveled in Europe because of ill-health, and upon his return to the United States was a correspondent of the *London News* and an editorial writer for the *New York Times* until 1865. In July of that year he established and became the editor of the *Nation*, a weekly critical journal in the fashion of the *London Spectator*. Of this he was sole proprietor until 1866, when he associated with himself Frederick L. Olmsted and James M. McKim. When, in 1881, the *Nation* began its appearance as the weekly issue of the *New York Evening Post*, he became a proprietor and the editor of the joint periodical, and so continued until his formal retirement in 1899. From Harvard he received the degree of M.A. (1871), and from Oxford that of D.C.L. (1897). His publications include a *History of Hungary, A.D. 300-1850* (1856); a work on *Government* (1871, in the "American Science Series"); *Reflections and Comments*, a selection from *Nation* articles; *Problems of Modern Democracy*, reprinted contributions from various magazines; and *Unforeseen Tendencies of Democracy*, collected papers originally written for the *Atlantic Monthly*. He is reckoned among the chief of American editors, not as the director of a complex journalistic enterprise, but as a leader-writer of uncommon skill and ease. His style was flexible, pointed, peculiarly suited to narrative description, and seasoned with a certain effective humor. His judgments, though at times questionable, were remarkably acute; his estimates singularly just. Highly trained in problems of finance and government, in politics stoutly independent, he attacked the protective tariff, furthered reconstruction, and strove for reform, particularly in the currency and the civil service. His warfare against Tammany contributed greatly to the overthrow of that organization in 1894, and involved the *Post* in numerous libel suits. To the policy of so-called "expansion" he was sincerely and constantly hostile, and during the McKinley administration declared that there was a constant evasion of the civil service law. Not unnaturally he was often misrepresented and misunderstood, but his position as thinker, writer, and "champion of good causes and high ideals" is now generally conceded.

GOLD. The gold mining industry of the United States made some advance during 1902, the total output, as estimated by the director of the mint, being \$80,853,070, against the final return for 1901 of \$78,666,700; the absolute increase was \$2,186,370, or about 2.8 per cent. Colorado, which produces at present about one-third of

the total for the entire country, showed a slight decrease from the yield of 1901. The production in 1901 and 1902 (estimated) was distributed among the States and Territories as follows:

	1901		1902	
	Troy Ounces.	Value.	Troy Ounces.	Value.
Alabama	150	\$3,100	139	\$2,873
Alaska	333,096	6,885,700	378,476	7,823,793
Arizona	197,515	4,083,000	201,000	4,155,039
California	817,121	16,891,400	828,419	17,124,941
Colorado	1,339,673	27,693,500	1,330,430	27,502,429
Georgia	6,023	124,500	4,353	102,388
Idaho	90,427	1,869,300	100,000	2,067,183
Michigan	1,490	30,800	1,490	80,800
Montana	229,495	4,744,100	200,000	4,134,365
Nevada	143,374	2,963,800	170,000	3,514,212
New Mexico	33,302	688,400	33,302	688,400
North Carolina	2,685	55,600	4,440	91,783
Oregon	87,950	1,818,100	90,000	1,860,465
South Carolina	2,259	46,700	7,156	147,828
South Dakota	313,446	6,479,500	357,881	7,398,037
Texas	29	600	29	600
Utah	178,513	3,690,200	180,000	3,720,930
Virginia	256	5,300	215	4,444
Washington	28,802	580,800	21,000	434,109
Wyoming	614	12,700	2,188	45,230
Other States	150	3,101
Total	3,805,500	\$78,066,700	3,911,268	\$80,853,070

New developments of encouraging character were reported in the Silverton, Clear Creek and Leadville districts of Colorado, but they were offset by the diminished output of some of the older mines, owing to exhaustion of resources. In the Cripple Creek district one of the richest mines will soon be abandoned; while other mines have reached such depths as seriously to increase the cost of operation and thus to diminish the amount of ore that can be extracted at a profit. A plan was proposed in 1902 for the construction of a tunnel to drain the lower levels of the Cripple Creek mines—an improvement that would permit much deeper development. Increased activity in California was due not so much to new discoveries as to the advance made in mining methods. Lower fuel expenses, owing to the substitution of water power and petroleum in the place of coal, the wider use of the cyanide process, and the demand for low-grade gold ores as a flux in copper smelting, have greatly extended the field of operations. The recent introduction of dredges for working auriferous gravels has also contributed to the progress. The discovery of gold at Thunder Mountain, Idaho, was followed by a wild rush of prospectors from the other mining camps in the West. Deposits of low-grade ore were found, but their value has not as yet been fully tested. The Cape Nome region contributed the larger part of the output credited to Alaska.

Among foreign countries the Transvaal in 1902 made the greatest progress, although it recovered only a part of the ground lost during the Boer war. When operations are resumed in full force, this country will become without doubt the leading gold producer of the world. The auriferous deposits are of enormous extent and so regular in their metallic tenor that, before mining, the value of the ore can be determined with a fair degree of accuracy. In this connection it may be stated that an eminent authority on the South African mines—Mr. John Hays Hammond—has estimated the yield of the principal gold-bearing formation or reef within practicable mining depth at \$3,000,000,000 (*Transactions of the American Institute of Mining Engineers*, 1902), and this total must be increased largely if the other deposits are included. The natural conditions in the Transvaal are very favorable for deep mining, as the increase in temperature with depth amounts to only 1° F. for each 200 feet—an abnormally low average. It is thought that the workings may be carried down a vertical distance of 8000 feet, and possibly a depth of 12,000 will be reached before operations are finally checked.

Australia, with New Zealand, probably surpassed the United States in 1902, the total output being estimated at more than \$81,000,000. Mining was greatly hampered by the general drought, which doubtless would have brought about a decrease had it not been for the steady progress made in developing the rich deposits of Western Australia. The Kalgoorlie field was the most prominent producer in this state. The Canadian mines reported a smaller output than in 1901; the loss was due principally to the exhaustion of rich claims in the Klondike, where there have been no new discoveries of importance. Quartz mining was undertaken in a few localities, and some advance was made towards introducing more economical methods of working

the river gravels. Explorations have shown great areas of auriferous ground, which under ordinary conditions would richly repay working.

The world's output of gold in 1901 and 1902 is shown in the following table compiled from statistics collected at the United States mint and by the *Engineering and Mining Journal*:

	1901	1902		1901	1902
United States.....	\$78,666,700	\$80,853,070	Australia, including New		
Canada.....	24,462,222	19,500,000	Zealand	\$77,058,988	\$81,315,100
Mexico.....	10,329,316	9,067,979	All other countries....	31,850,134	34,439,349
Russia.....	28,911,744	29,971,500			
India (British).....	9,422,855	9,808,000	Total.....	\$262,641,853	\$299,866,343
Transvaal.....	4,939,944	35,211,345			

GOLD COAST, a British crown colony on the Gulf of Guinea between the Ivory Coast (French) and Togoland (German), has an area roughly estimated at upwards of 75,000 square miles and a population supposed to number about 2,000,000. The protectorate of Ashanti and the protected district known as the Northern Territories were incorporated in the colony in September, 1901. The area of the colony, as it was formerly comprised, was placed at 40,000 square miles and the population at 1,500,000. The governor in 1902 was Sir Matthew Nathan (since 1900), resident at Accra (population over 16,000). The revenue, including grants, and the expenditure amounted to £585,583 and £515,657 respectively in 1900, and £693,893 and £469,459 in 1901. In 1900 total imports and exports were valued at £1,294,963 and £885,446 respectively, and in 1901 £1,801,077 and £559,733 respectively. In the latter year the leading exports were: Palm oil, £178,174; rubber, £104,030; palm kernels, £89,794; timber, £55,299; cacao, £42,837. The principal imports are textiles, alcoholic liquors, and hardware. The cultivation of cacao is a promising industry. It was expected that in 1903 a considerable increase would be made in the gold export. A railway from Sekondi, on the coast, to Tarkwa, in the gold region, and thence to Kumassi, a total distance of 180 miles, is under construction. At the end of 1902 the line was completed to Obbuassi, 126 miles from Sekondi.

According to a report published in the autumn of 1902, the British during the four years of their occupation of the Northern Territories had brought about a condition of peace and order in place of raids and tribal feuds. Road-making had progressed favorably and there was little trouble in the collection of taxes. The most important factor in the future development of this part of the country was said to be the opening of the river Volta, which can be made navigable for 400 miles, or to within three days' journey of Gambaga. The expedition, which earlier in the year it was necessary to make against the wild Tiansse tribe, was successful after operations lasting about a month. Rumors in 1902 of a threatened uprising of the Bekwais, the tribe that assisted the British in putting down the insurrection of the Ashantis and Adansis in 1900, appeared to be without foundation.

GOLF. The season of 1902 saw a continuance of the vogue attained within the past few years in the United States, and as a special feature, the invention of a new and livelier ball which altered considerably the character of the game. In a review of American players, W. J. Travis, of Garden City, N. Y., although defeated for the amateur championship, stands in a class by himself, by virtue of his consistently superior game throughout the season. The tournament for the national amateur championship was played over the Glenview course, Chicago, July 15-19, under the modified rules of play adopted for this contest by the United States Golf Association in February. The medal play was changed to 18 holes instead of 36, and the number to qualify raised from 32 to 64. In the match play all preliminary rounds were at 18 holes and the final at 36, instead of all being at 36 as formerly. Another change was in the method of drawing, whereby, instead of seeding the draw as had been tacitly permitted, pairings were decided by scores at medal play. According to the scores made, 1 paired with 33, 2 with 34, 3 with 35, and so on, and the pairs were arranged with the view of keeping the players with the best scores separated until the last rounds. The championship was won by Louis N. James, of Chicago, who defeated E. M. Byers, of Allegheny, Pa., by 4 up and 2 to play. In the semi-final round Byers defeated D. P. Fredericks, Oil City, Pa., 4 up and 3 to play; and James disposed of F. O. Reinhart, Baltusrol, 2 up and 1 to play. Travis was defeated by Byers in the second round, 3 up and 2 to play. The national woman's championship, contested at Brookline, Mass., September 30-October 4, was won by Miss Genevieve Hecker, N. Y., the winner in 1901, who defeated Miss L. A. Wells, Brookline, 4 up and 3 to play. The open tournament (for amateurs and professionals, medal play at 72 holes), was held at Garden City, N. Y., October 10 and 11. Lawrence Auchterlonie, professional of the Glenview Club, Chicago, was first (307), and W. J. Travis, amateur, and Stewart Gardner, professional, Garden City, tied for

second place at 313. In the Metropolitan championship Travis won, defeating F. A. Marcellus, 11 up and 10 to play. The woman's championship in the metropolitan tournament was won by Mrs. E. A. Mamce, Baltusrol, who defeated Miss Helene Hernandez, Essex County (N. J.) Country Club, 7 up and 6 to play.

In intercollegiate golf there were two tournaments, the first one over the Garden City course, May 6-10, and the second at Morristown, N. J., October 21-25. In the first, Yale defeated Harvard (by the intercollegiate system of scoring, 1 point for each match and half the number of holes winner is up) 13-5. The individual championship went to C. Hitchcock, Jr., Yale, who defeated H. B. MacFarland, Pennsylvania, 11 up and 10 to play. In the second, Harvard defeated Princeton for the team championship, 10-6. H. C. Egan, Harvard, won the individual honors, defeating MacFarland by 1 up.

GOKE, CHARLES, an English prelate, consecrated Bishop of Worcester February 23, 1902, was born in 1853, received his education at Harrow and at Balliol College, Oxford, and in 1875 became a fellow of Trinity College, Oxford. From 1880 to 1883 he was vice-president of Cuddesdon Theological College, and in 1884, upon the foundation of the Pusey Library at Oxford, became head of the clerical staff. In 1893, on account of protests against certain of his views, published especially in the volume of essays, *Lux Mundi*, of which he was editor and one of the chief contributors, he resigned, and accepted the vicarage of Radley near Oxford. The following year he was appointed canon of Westminster. He had been regarded as a figure in university life, and it was feared that he might not appeal to the masses, but he proved, on the contrary, a most popular preacher. The views which had already met with antagonism he continued to advance, and in 1901 protests were made against the confirmation of his election as bishop of Worcester. The anti-ritualist agitator, John Kensit (*q.v.*) objected at the public ceremony (January 22, 1902), on the ground that the semi-monastic, celibate society, the Community of the Resurrection, which Gore had founded, violated Protestant traditions. At this ceremony and at the later consecration occurred protracted and disgraceful riots which served only to place the objectors in the position of lawbreakers rather than of reformers of evil tendencies in the church. Bishop Gore's most important works are: *The Church and the Ministry* (1889); *The Mission of the Church* (1895); *The Body of Christ* (1901); *Roman Catholic Claims*, a controversial treatise (1889).

GORMAN, ARTHUR PUE, Maryland politician, after several years' retirement from participation in national politics, was elected in 1902 to succeed George L. Wellington in the United States Senate. He was born in Howard County, Md., March 11, 1839, was educated in the public schools, and gained his first experience in political life as a page in the United States Senate. His long service (1852-66), through a critical period in the nation's history, and at a time when the Senate contained some of America's greatest legislators, gave him a political education that could not be excelled. In 1866 he was appointed by President Johnson collector of internal revenue for the fifth district of Maryland. In this position he showed himself so capable an official that in 1869 he was appointed director of the Chesapeake and Ohio Canal Company, of which he has been president since 1872. His political career in Maryland began in 1869 with his election, as a Democrat, to the house of delegates, where he served by re-election until 1875, and was chosen speaker in 1873-75. From 1875 to 1881 he was a member of the State senate, becoming at the same time the Democratic leader of that body. In 1880 he was elected to the United States Senate, where he began a notable service that lasted until 1899. Since 1881 he has been in complete control of the political organization in Maryland. In national Democratic politics he has been an important factor, although openly in disagreement with its dominating policy, whether that happened to be the conservative control of the Cleveland Democracy or the radical populism of the Bryan leaders. As the particular champion of special interests he so remodeled the Wilson Tariff Bill after it was sent to the Senate in 1894, as to make it practically a protective measure, which President Cleveland refused to sign. His hostility to the second Cleveland administration, many of whose failures in carrying out its legislative programme may be laid at his door, was no more marked than his opposition to "Bryanism," which led him to withdraw after the Chicago Convention of 1896 from all actual leadership in the organization.

GOTTI, GIROLAMO MARIA, an Italian prelate of the Roman Catholic Church, was appointed in 1902, by Pope Leo XIII., Prefect of the Propaganda, or head of the missions. The selection was of particular interest in the United States since it is considered by the church a missionary country. Cardinal Gotti was born March 26, 1834, in Genoa, where his father was a dock laborer. He developed a talent for physical science and mathematics, and after his ordination to the priesthood in the Carmelite Order, was made professor of mathematics and natural philosophy at the College of St. Ann, Genoa. He rose rapidly in his order, and became provincial and an adviser of the Roman congregations. Several diplomatic missions to South

America, which he fulfilled with success, especially in Brazil, gave him prominence among the diplomats of the church. In 1895 he was created a cardinal, and later prelate of the congregation of bishops and regulars. His selection was a distinct tribute to his ability, for the office has come to be regarded almost as an appanage of the secular cardinals. Also since he came to his new office without any affiliations, never having engaged in politics, his appointment seemed sure to prove in every way acceptable.

GRANT, GEORGE MONRO, a Canadian author, educator, and clergyman, died in Kingston, Ont., May 10, 1902. He was born at Albion Mines, Nova Scotia, December 22, 1835, and was educated at the University of Glasgow, which in 1877 granted him the degree of D.D. In 1860 he was ordained in the Presbyterian ministry, and occupied pastorates in Georgetown, P. E. I., and at St. Matthew's Church, Halifax, the latter an incumbency of fourteen years. He became principal of Queen's College, Kingston, Ont., in 1877 and raised it from a state of poverty and unpopularity to its present place among the three great universities of Canada. In 1889 he was chosen moderator of the general assembly of the Presbyterian Church of Canada, became president of the Royal Society of Canada in 1891, and from 1894 to 1896 was president of St. Andrew's Society, Kingston. Dalhousie University of Halifax conferred upon him the degree of LL.D. in 1892. Together with Sir Sandford Flemming he made the overland journey to British Columbia in 1872, which he described the next year in *Ocean to Ocean*. His other works include *New Year Sermons* (1865-66), *Reformers of the Nineteenth Century* (1867), *Picturesque Canada* (1882), *Our Five Foreign Missions* (1887), *Advantages of Imperial Federation* (1889), *Our National Objects and Aims* (1890), *The Religions of the World in Relation to Christianity* (1894), *The Religions of the World* (1895).

GRAPHITE. See MINERAL PRODUCTION.

GRAY, HORACE, a former associate justice of the Supreme Court of the United States, died at Nahant, Mass., September 15, 1902. He was born at Boston in 1828, graduated at Harvard University in 1845, at the Harvard Law School in 1849, and was admitted to the bar in 1851. In 1854 he was appointed reporter to the Massachusetts Supreme Court, and held that position for seven years. During the latter part of that period he was a partner of the late Ebenezer Rockwood Hoar. His reputation as an able lawyer grew rapidly, and in 1864 he was appointed an associate justice of the Supreme Court of his State, in 1873 succeeding to the chief justiceship, and continuing in that office for nine years. His eighteen years' experience on the Massachusetts bench gained for him a wide reputation as a judge, his decisions being remarkable for their clearness and forcible style. In 1882 he was appointed to the Supreme Court of the United States by President Arthur, and occupied that position until his resignation in August, 1902. Justice Gray was a man of imposing presence, and his manner on the bench was unusually dignified. He belonged to the political school of thought which upholds a broad, or "loose," construction of the federal constitution, and his opinions in the insular cases that arose (1901) as a result of the acquisition of new possessions by the United States supported the contentions of the Washington administration. In his earlier years he was a member of the Free Soil party.

GREAT BRITAIN. The United Kingdom of Great Britain and Ireland covers an area of 120,979 square miles, with an estimated population in 1902 of 41,952,510. The regular decennial census of March 31, 1901, gave the number as 41,454,578, of whom 30,805,406 were in England, 1,720,609 in Wales, 4,471,957 in Scotland, and 4,456,546 in Ireland. The United Kingdom is the nucleus of the British Empire, the executive power of which is vested in the sovereign acting through his ministers. It is a strictly limited monarchy, however, in that the real power is in the hands of Parliament, which has complete legislative control, so that while the king may command, it is the legislative body that directs. The ministry in office during 1902 represented politically the Unionist party, elected in 1895 and re-elected in 1900. The main officials at the end of the year were: In the cabinet—First lord of the treasury and lord privy seal, Arthur James Balfour; lord high chancellor, Earl of Halsbury; lord president of the council, Duke of Devonshire; home secretary, Mr. Akers-Douglas; foreign secretary, Marquis of Lansdowne; colonial secretary, Joseph Chamberlain; secretary for war, William St. John F. Brodrick; secretary for India, Lord George Hamilton; first lord of the admiralty, Earl of Selborne; chancellor of the exchequer, C. T. Ritchie; lord chancellor of Ireland, Lord Ashbourne; chief secretary for Ireland, George Wyndham; chief secretary for Scotland, Lord Balfour of Burleigh; president of the board of trade, Gerald Balfour; president of the local government board, Walter Long; president of the board of education, the Marquis of Londonderry; president of the board of agriculture, Robert William Hanbury; postmaster-general, Austen Chamberlain; lord lieutenant for Ireland, the Earl of Dudley. Parliament is divided into two chambers, the House of Lords

and the House of Commons. The former consists of peers who hold their seats by hereditary right or through patents of nobility granted by the sovereign; or because of their office, as in the case of the English bishops of the Established Church. Irish and Scotch peers are not entitled to a seat, but elect a representative few of their number for life in the case of the Irish nobility, and for the term of Parliament, in the case of the Scottish peers, to represent them in the upper house. English and Scottish peers are further disqualified for election to the House of Commons while non-representative Irish peers are eligible. The lord high chancellor of England, Hardings Stanley, Earl of Halsbury, is the speaker of the House of Lords. The House of Commons contains 670 members elected by popular vote. The Protestant Episcopal Church is the established church of the country, the king being its supreme governor. The religions of all denominations and sects are equal with the Established Church before the law.

Finance.—According to the budget for the financial year April, 1902, to March, 1903, presented by the chancellor of the exchequer on June 4, 1902, the revenue estimates amounted to £147,785,000, and the expenditure was placed at £176,359,000, a nominal deficit of £28,574,000. To cover the deficiency a duty was placed on imported corn, grain and meal, which was estimated to produce £2,650,000; the income tax was raised to 1s. 3d. in the pound, which would bring £2,000,000; and a balance deficit of £23,924,000 was to be met out of the consols loan. This loan was authorized by the Loan Act of 1901, the total amount of which was £56,553,000. After all the appropriations of the House of Commons had been met, the sum of £5,996,000 was set aside for contingencies, and for redemption of unfunded debt. The national debt of Great Britain, consisting of funded, unfunded, and other liabilities, amounted to £731,214,583 in 1902. The permanent debt, so termed because the government is not compelled to liquidate it at any fixed time, consisted on March 31, 1902, of the following stock: $2\frac{3}{4}$ per cent. consols, £499,958,418; $2\frac{3}{4}$ per cent., 1905, £4,588,201; $2\frac{1}{2}$ per cent., £31,394,669; Bank of England debt, £11,015,100; Bank of Ireland debt, £2,630,769; $2\frac{3}{4}$ per cent. consols not included in the annual charge, £60,000,000, making a total of £609,587,248. The terminable annuities, etc., made up a total of £63,190,859. The unfunded debt, made up of loans for fixed short periods, consisted of nine and twelve months' treasury bills amounting to £8,133,000; and war stock and bonds $2\frac{3}{4}$ per cent., repayable in 1910; exchequer bonds 3 per cent., repayable in 1903 and 1905; and six, nine and twelve months' treasury bills; a total of £67,000,000, the interest on which is excluded from the fixed annual charge. Other capital liabilities, such as the Russian Dutch loan annuity, the Uganda Railway, naval, military works, etc., Pacific Cable act, friendly societies, postoffice savings banks, and similar other items, made up a total of £32,613,757. The cost of the national debt amounted to £21,685,531, an increase over the previous year of £1,850,043. This huge debt has been caused almost entirely by foreign wars.

Army.—The army budget for 1902-03 demanded £69,310,000, a decrease of £17,605,000 from the estimates of the previous year. (See paragraph Parliament, Spring Session).

Navy.—The naval estimates for 1902-03 aggregated £31,255,500, an increase over the previous year of £380,000. Of this total £28,962,600 was for the effective services. The first lord of the admiralty is the practical head of the navy and is held responsible for its general efficiency. Under him there are four naval lords, a civil parliamentary lord and a financial or parliamentary secretary. The senior naval lord, usually an experienced admiral of high rank, is to the navy what the commander-in-chief is to the army. The amount of money set apart for new construction was £9,058,000, of which £700,000 was ordered to be expended in beginning new vessels. The new programme included 2 battleships, 2 armored cruisers, 2 third class cruisers, 4 scouts, 9 torpedo boat destroyers, 4 torpedo boats and 4 submarines. The battleships are of the *King Edward VII.* type. Included in the plan of reconstruction was the placing of all the 6-inch guns of the *Royal Sovereign* into casemates. The 4.7-inch guns of the *Barfleur* and *Centurion* were also to be replaced by 6-inch guns in casemates. Four 6-inch guns each were added to the armament of the *Powerful* and *Terrible*, and in 13 ships of the *Arrogant* and *Talbot* classes 6-inch guns were substituted for the 4.7-inch guns. The national interest in the effectiveness of the navy was undiminished during the year. On March 14 Lord Charles Beresford, addressing a special meeting of the London Chamber of Commerce, made an important address on the "Lack of Administrative Efficiency in Our Organization for Defense and Its Remedies." The total collapse of the war department during the Boer war had caused a general feeling of uneasiness throughout the country with regard to the naval service, so that great importance was attached to Lord Beresford's criticisms. The government was questioned in both houses of Parliament, and in the House of Commons especially the subject was very thoroughly discussed. Early in the year a meeting was held at Mansion House under the presidency of the lord mayor to consider the re-establishment of the

Royal Naval Volunteers. The following resolution was adopted: "That this meeting of representative citizens of London cordially welcomes the proposal provisionally made by the admiralty memorandum of August 26, 1901, for the formation of a volunteer reserve for His Majesty's navy, and desires to express the belief that such a movement would be heartily supported by the city and boroughs of the metropolis." An important appointment, dated February 1, 1902, was that of Mr. Watts as successor to Sir William White, the assistant controller of the navy and director of naval construction. According to the new naval regulations, it is ordered that the gunnery lieutenant of each ship is in future to take charge of all the hydraulic machinery which is in any way connected with the gun mountings; similarly, the torpedo lieutenant is to be responsible for the dynamos, motors, torpedoes, etc., of the torpedo armament. One of the most radical changes for many decades is the new scheme for the entry, training and supply of naval officers issued by the first lord of the admiralty on Christmas day, 1902. A résumé of its more important features is as follows: All officers, whether executive, engineer, or marine, enter the service as naval cadets under precisely the same conditions and are trained under the same system until they have passed for the rank of sub-lieutenant between the ages of nineteen and twenty. At about the age of twenty they are distributed between the three branches of the service—executive, engineer and marine. Cadets between the ages of twelve and thirteen, after their entrance examination, are sent to the Royal Naval College, where they spend four years, after which they become midshipmen and enter on their sea instruction. A special feature of their training will be instruction in mechanics and marine engineering. All grades of the engineer branch are to receive executive designations of rank; engineer students become engineer cadets; assistant engineers, engineer sub-lieutenants; engineers, chief engineers; and staff engineers, engineer lieutenants; fleet engineers, engineer commanders; inspectors of machinery, engineer captains; chief inspectors, engineer rear admirals; and there is also a likelihood that the engineer-in-chief will rank as a vice-admiral. Marine officers are to share in the duties of the ship, but most radical of all is the decision that a certain proportion of warrant officers will be granted commissions.

Agriculture.—The Board of Agriculture for Great Britain has not issued any statistics for 1902 other than those relating to the area under crops. No information regarding holdings and allotments has been published since 1897. There has been an increasing interest in the agricultural question, and the Allotments and Small Holdings Association, which was founded in 1885 to assist agricultural laborers to obtain small allotments of land, has been correspondingly active on their behalf. Many agriculturists have come to the conclusion that the successful and profitable working of their land is impossible under the system of free trade. The tenant farmers as a whole find it difficult to meet their obligations under present conditions, and argue that import tariffs, while it might give them a market, would only result in increasing the rent of their holding to the exclusive advantage of the landlord; hence the interest in the association above mentioned. The total acreage of all the crops and grasses for 1902, exclusive of mountain and heath land in Great Britain, amounted to 32,387,965, as against 32,317,445 in the previous year. The official statement classifies the crops as follows: Wheat, 1,726,473; barley, 1,909,383; oats, 3,057,203; rye, 68,379; beans, 243,101; peas, 179,751; potatoes, 573,880; turnips and swedes, 1,608,661; mangels, 441,414; cabbages, 69,039; other crops are kohlrabi, rape, vetches, lucerne, and 104,788 acres of other green crops. The larger part of the fruit cultivation is in the southern counties of England, and in 1902 absorbed 236,856 acres. The agricultural condition of the country is far from encouraging, but the national need for a food supply in time of war is compelling the interest of both houses of Parliament and the country at large. It is one of the most difficult problems of English politics, in that it touches on so many other points of national policy. A favorite formula of the Imperial Federationist party is, "the colonists to supply us with food and the mother country to supply them with manufactures." This would mean the inevitable ruin of English agriculture.

Mineral Production.—The latest statistics regarding the output of coal in Great Britain and Ireland are obtained from a Blue Book issued in October, 1902, the statistics given being for 1901. The full total was 219,046,945 tons, a decrease of 6,134,355 tons as compared with 1900. The average price of coal in 1900 was 9s. 4.29d. per ton at the mines, a decrease of nearly 18d. from the price obtained in 1900. It is calculated that the coal strike in the United States increased the output of 1902 over 1901, but not to any very appreciable extent. During 1901 Great Britain imported 10,000 tons of coal and exported 58,405,000; an excess over imports of 58,395,000. At the beginning of the year it was feared that foreign competition would flood the whole market with coal, a dread which was further increased by the coal tax imposed by the chancellor of the exchequer. In iron and steel the market was particularly strong and active throughout the year, owing

to the strong demand of the United States and Canada; an increase in the output of pig-iron of about 200,000 tons distinguished the first six months of the year, a record which was exceeded in the second half.

Ship Building.—The exact figures for ship building are not, at this time, obtainable, but orders for new ships at the various yards have been comparatively few, in many respects smaller than for several preceding years. According to Lloyds' Register the total number of steamships and sailing vessels of 100 tons register and upwards was 29,628, with an estimated tonnage of 32,437,763. The number of sailing vessels of all countries is 12,472, with a net tonnage of 6,577,776 tons. Of this number 11,041 ships were British, their tonnage total being 15,546,897.

Business and Commerce.—So far as business was concerned the year 1902 opened in gloom. The war was still in progress and gave no indication of any immediate ending. It was expected that the government would be compelled to make another large loan, which would have the effect of making money scarce and dear. All Europe seemed to be arrayed against Great Britain. In India the famine continued, in Australia the long drought entailed heavy financial losses upon New South Wales and Queensland; the Chinese markets were practically dead, as the result of the Boxer episode; and, in brief, the whole world was purchasing less from the British manufacturers than had been the case for many years. Early in the year, however, as the tide of war turned more strongly against the Boers, the feeling in the business world became more optimistic, with the result that early there developed an active market in consols and South African gold shares. The former rose almost to 98, and a few of the South African investments sold their shares higher than at any time since the boom of 1895. The moment peace was assured selling on a very large scale set in and was maintained for the following half year. Consols dropped almost to 92, and the fall in South African investments ranged anywhere from 20 to 50 per cent. Money was not very plentiful, but could be obtained on fairly reasonable terms by all who were in good credit. On the continent affairs were scarcely less favorable, and consequently reacted upon the London money market. Conditions in France caused the private hoarding of money and the withdrawal of deposits from the banks, with the result that the French banks withdrew a large proportion of the money they had been employing in London, while on the French exchange consols, gold shares, and other securities were sold in the most reckless fashion. The scare spread to Germany with like result. Besides this, there was prevalent a very exaggerated fear that what was known as the balloon of American prosperity was soon to be punctured, with the result that a crisis would surely follow, and consequently many of the foreign banks refused to renew American bills and sold American securities freely. Such a condition of affairs in Europe of necessity reacted disastrously on the English exchanges, and caused the heavy fall in securities that continued until the end of November. With the advent of December the business atmosphere brightened, and the year 1902 ended more satisfactorily than was expected. The cessation of hostilities rescued the government from the necessity of borrowing on the scale that had obtained in 1901. In that year new consols had been issued for sixty million sterling, while in 1902 only thirty-two million sterling were added. It had been the custom of the government previous to 1901, when the taxes were not paid promptly enough for its requirements, to borrow money from the Bank of England on what came to be known as the deficiency bills, but during the war the system reacted most disastrously upon the London money market and consequently was abandoned. Under the British taxation system the greater proportion of the tax money is collected in the last three months of the financial year, with the result that the government is short of money during the first three-quarters of the year and is compelled to borrow money from the Bank of England. Realizing the defects of this system, the chancellor of the exchequer obtained authority from Parliament to apply in the open market for money instead of relying entirely upon the Bank of England. The scheme was fairly successful except that it prevented money from becoming plentiful in the open market. The rates of interest and discount, however, were lower in 1902 than in the year previous, and considerably lower than it had been in 1900. In explanation of this a leading London financial authority stated that it was owing to the fact that government borrowings were less in 1902 than they were the year before; also that in 1900 conditions in Germany sent the money in that country very high, which reflected on the London market; in the third place, there had not been large shipments of gold from London to the United States. The Bank of England rates of discount never went below 3 or over 4 per cent. during the entire year, and in January the rate was reduced from 4 to 3½ per cent., and in February to 3 per cent. In October it was raised again to 4 per cent., where it remained to the end of the year. The several important banking events of 1902 were as follows: The International Banking Company, of New York, established a London branch for the purpose of obtaining business with the Philippines; the

National Bank of the South African Republic was made the National Bank of South Africa; the Agricultural Bank of Egypt was organized with a capital of two and a half million sterling; the Bank of China and Japan went into liquidation, and the larger banks of London bought up and otherwise absorbed a large number of small banks in London and the provinces. The tendency to concentrate is as conspicuous in the banking world as in the manufacturing world. Public opinion seems to have declared the doom of private banks. These latter hold no public meetings and publish no detailed accounts, so that their business is unknown, and consequently helps the joint-stock banks.

The silver market was very unsettled throughout 1902. A heavy fall occurred in the middle of March, largely owing to the difficulties with China, who was compelled to pay the indemnity demanded by the Powers in gold, so that she had to sell silver, with the result that the 26d. per ounce that obtained in January had gone below 22d. in August. Besides this, Spain gave up the coinage of silver, and the Siamese government adopted the gold standard. The total imports of silver into the United Kingdom during the year were £9,764,296, or £1,737,382 less than in 1901; the total exports were £1,333,719 less than in 1901. The total imports of gold, which remained very steady during the year, were £21,629,049, or £913,421 more than 1901. Great Britain received, however, about five millions sterling from South Africa, a considerable advance on the year before. Exports of gold amounted to £15,409,088, 10.3 per cent better than in the preceding year. The revenue, railway, clearing house, and board of trade returns indicated a fairly satisfactory condition of trade. The revenue for the nine months ending with December practically coincided with the estimates of the chancellor of the exchequer.

The seventeen railway companies of the United Kingdom improved their gross receipts over a million and a quarter, or 2.8 per cent. more than in 1901, the receipts amounting to £47,699,000. The clearings of the London Clearing House were £467,573,000 in excess of 1901, and amounted to a total of £10,028,742,000. This is particularly remarkable in that 1901 had been reckoned the record year. The increase was attributed to the augmentation of debt consequent upon the South African war, but the balance of the increase was in trade proper.

According to the board of trade returns for December, the total imports were £528,860,284, or £6,870,086 in excess of the year previous. The same authority gives the exports of British and Irish produce as £283,539,980, which is £3,517,604, or 1.3 per cent. the better of the preceding year. The improvement, however, was more in the home trade than in the foreign. In fact, it has been observed that during the past twelve or fifteen years the home trade has steadily increased, notwithstanding adverse influences or circumstances, in which it differed considerably from the foreign trade that naturally varied according to the politics of the world and the economic conditions of the purchasing countries. The coal strikes in the United States and France helped the foreign trade, but on the other hand the famine in India, drought in Australia, trouble in China, and war in South Africa were unfavorable. The wool sales during 1902, according to the returns of the London-Colonial wool sales, amounted to 1,048,906 bales, of which 451,000 bales went to the continent of Europe and the United States, the remainder being taken by the home trade. The price for merino wool was especially high, the drought in New South Wales indicating the scarcity of merino for some years to come. The uncertainty regarding the American cotton crop caused a general hesitation in the cotton market during the early months of 1902, and the spinning branch of the cotton industry throughout England became so depressed that the factories ran on reduced time in the hope of altering the situation. Towards the end of the year conditions improved, although in no part of the spinning or weaving trades was there any real prosperity.

Imports and exports have been as follows:

	1900	1901	1902
EXPORTS.			
Home products.....	£291,191,996	£280,022,375	£283,539,980
Reshipment of imports.....	63,181,758	67,841,892	66,810,684
Total exports.....	£354,373,754	£347,864,268	£349,360,664
IMPORTS.			
Total merchandise.....	£528,075,163	£531,990,193	£528,860,284
Excess of imports over exports.....	£163,701,409	£174,125,930	£179,509,620

The following table shows the imports to and exports from Great Britain by countries in 1900 and 1901.

COUNTRY.	Imports.		Exports.	
	1900	1901	1900	1901
Russia.....	£21,984,000	£21,904,000	£16,360,000	£14,211,000
Scandinavia (including Denmark) . . .	29,579,000	29,792,000	15,130,000	13,521,000
Germany.....	31,182,000	32,207,000	38,543,000	34,221,000
Netherlands.....	31,381,000	32,872,000	14,931,000	13,744,000
Belgium.....	23,503,000	24,666,000	14,846,000	12,625,000

HISTORY.

Parliament (Spring Session).—The third session of the twenty-seventh Parliament of the United Kingdom of Great Britain and Ireland and the second of Edward VII., was opened by His Majesty in person accompanied by the queen, on January 16, 1902. The speech from the throne announced that the relations of Great Britain with other Powers continued to be of a friendly character. With regard to the war in South Africa the king announced that the course of operations had been favorable to British arms, that their scale had been largely reduced, and that industries were being resumed in the South African colonies. With reference to the relations of

Great Britain with other Powers, the king recited the circumstances under which the International Conference at Brussels on sugar bounties had been called at the instance of the king of the Belgians, and expressed the hope that its decision might lead to the abandonment of a system by which the sugar producing colonies and the home manufactures had been unfairly weighted in the prosecution of sugar manufacturing. He announced the conclusion of treaties with the United States relative to the construction of the isthmian canal and with Brazil for the arbitration of disputed territory between Brazil and British Guiana. With reference to the settlement of the latter dispute he announced that the king of Italy had consented to act as arbitrator. With regard to India, he expressed regret that on account of the scarcity of rain in that country famine and distress had prevailed there, and that the continuation of relief measures for a while longer would be necessary. He informed Parliament that measures would be laid before it for the coordination and improvement of primary and secondary education; for improving the water supply of London; for facilitating the sale and purchase of land in Ireland; for improving the law of valuation; for restricting the sale of intoxicating liquors; for amending the patent law; and for reforming the law of lunacy. At the adjournment in August only one of these measures had been finally disposed of, although some progress had been made on the education bill. Much of the time of this session was taken up with a discussion of the proposed new rules of procedure, in the House of Commons, the general purpose of which was to facilitate the dispatch of legislative business. In regard to the maintenance of order, the new rules attached more serious consequences than heretofore to the suspension of a member, requiring an apology before the offender might resume his seat. The speaker was authorized to adjourn the House at his own discretion in case of disorder. The proposed rules also permitted the introduction of bills without the formal consent of the House, changed the hours of meeting, and limited the period for questioning members of the government as well as the power to debate, or challenge divisions on matters of routine. Against the government's proposition it was urged that the contemplated arrangements tended to suppress debate, encouraged resort to obstruction, and curtailed the privileges of private members in the presentation of bills. From the constitutional standpoint, objection was raised that an enforcement of the new penalties to the degree of excluding a member from an entire session of Parliament would inflict undue punishment upon a constituency, and violate its right to choose its own representatives. However, the ministry procured a sanction of most of the rules.

Another measure of importance which occupied a considerable portion of the time of the Parliament was the army reorganization bill. This scheme provided for the creation of a reserve of militia, yeomanry, and volunteers, and an improvement of the medical service. It also provided for the relief of officers from certain burdens and the allowance of a more substantial salary for new recruits and veterans with a view to encouraging enlistment and long service. The scheme, furthermore, provided for more artillery and mounted troops, better trained officers, more barracks in every army corps district, more training grounds, special training of the militia and volunteers, etc. The total number of new troops under this scheme is intended to be 125,500 at a cost of £2,000,000. The total home force is estimated as follows: Regulars, 155,000; reserves, 70,000; militia, 150,000; yeomanry, 35,000; volunteers, 250,000. Very important changes were also effected in the organization of the war office. An inspector-general of artillery was provided for to be followed by an inspector of yeomanry. General officers are to have larger financial powers; a war office board is to be created; a war office council and a permanent executive committee of the war office are also provided for, while the duties of the army board have been changed in several particulars. A measure which called forth much discussion was the budget presented by the chancellor of the exchequer on April 14, which estimated the expenditure for the ensuing year at £174,609,000, involving a deficit of about £45,000,000. It was proposed to meet this by the imposition of duties on cereals, an increase in the income tax, a suspension of the sinking fund, and the doubling of the stamp tax on checks and dividend warrants. A loan of £30,000,000 was also proposed. The proposal for an increased tax on bank checks was finally withdrawn by the chancellor of the exchequer. The *revised* estimates of the budget as announced on June 10, placed the total expenditures for the year at £176,400,000. Other measures which came in for a considerable share of discussion were bills to lessen habitual drunkenness by stricter regulation of licenses; to provide old-age pensions for the deserving poor; and to protect copyrights on musical publications.

Parliament (Autumn Session).—Parliament reassembled on October 16, 1902, in continuation of the session which began in January and lasted until August. The most important acts of the session were the education bill for England and Wales, the London water bill, the Osborne estate bill, the metropolitan water act, the militia and yeomanry act, the patents act, the supreme court of judicature act, the Indian budget, and the Uganda railway act. The prorogation took place on December 18.

The speech from the throne gave a survey of the condition of the empire and recited the chief events of note which had occurred during the year. The king congratulated Parliament on the conclusion of the war in South Africa with an honorable peace; announced that the new colonies of the Transvaal and Orange River had been incorporated in the empire, and recited a list of new treaties concluded with foreign Powers. See paragraph Foreign Relations.

The Education Bill.—By far the most important measure of Parliament was the education bill, which had been before that body for more than a year. It had excited great interest throughout the kingdom and was strongly opposed both in and out of Parliament by large numbers of Non-conformists and Liberals, chiefly on the ground that it provided for taxation of the rate payers for the support of denominational instruction and vested the control of the schools in bodies, a majority of whose members were to be chosen by the church authorities and a minority by the county or borough councils. The bill made little progress at first in the House of Commons and was carried over as unfinished business from the summer session to the autumn session, when, by means of the closure, its passage was expedited. Finally, on December 3, 1902, it passed the third reading in the House of Commons by a vote of 240 to 123. The bill was immediately sent to the House of Lords, where, in the presence of only three peers it was read for the first time. It passed the third reading December 15, and received the royal assent the same day. The bill as finally passed, abolishes all school boards outside of London, and makes the county and borough councils the local education authority. In place of the old elective school boards, school committees are to be appointed by the councils. In the case of the so-called voluntary or church schools, the actual control is to be in the hands of a body of managers with power to appoint teachers, the majority of managers to be appointed by the denominations. Denominational schools are to be maintained partly by a grant from the imperial exchequer, but mainly at the expense of the rate payers provided thirty pupils attend, and provided the school buildings are kept in repair by voluntary subscription. Teachers for denominational schools are to be selected with reference to religious rather than educational qualifications, thus excluding the teaching profession so far as the majority of primary schools are concerned. It was objected by the opponents of the bill that the committee managing the school would be controlled by the religious body interested, which selects two-thirds of the body of managers. Mr. Bryce, who led the opposition to the bill in the House of Commons, thus sums up the case against it: "The bill proposed to hand over half the schools of the country in perpetuity to one denomination alone; to exclude from the post of teacher in one-half of the schools of the country all persons who would not declare themselves members of the Church of England; to perpetuate the distinction of two classes of schools differently managed, but standing side by side; and to destroy the bodies which in the towns had worked successfully for education, and, indeed, had done nearly all that had been done for it during the last twenty-five years. These were the four things which the bill proposed to do. The first was against constitutional principles; the second, against justice; the third, against economy; the fourth, against common sense. And all were against education." Threats of "passive resistance" by refusal to pay rates and otherwise obstructing the enforcement of the law have been numerous and general among the Non-conformists.

Other Measures of Parliament.—Other important measures of Parliament were the local government (Ireland) act, which amends the existing law in several particulars, especially with regard to contributions to county infirmaries, remuneration of medical practitioners and superannuation of officers; the metropolis water act, which provides for the establishment of a water board charged with acquiring and managing the undertakings of the metropolitan water companies of London; the militia and yeomanry act, which provides for the creation of reserve divisions of the militia and yeomanry; the Osborne estate act, which provides for the transfer of the Osborne House estate on Isle of Wight, from King Edward, whose property it became under the will of Queen Victoria, to the nation, and its assignment to become part of the hereditary revenues of the crown, Parliament agreeing to preserve and keep open to the public such part of the house as was personally occupied by the late queen, the rest to be used as a convalescent home for military and naval officers; the patents act, which amends the law with reference to applications for patents and compulsory licenses and other matters connected therewith; the Uganda Railway act, which provides that the maximum amount authorized to be raised under previous acts shall be £5,530,000 instead of £4,930,000, and any sums so raised may, if necessary, be applied under the direction of the treasury for the purpose of paying the principal of and interest on any temporary loan raised for the purpose of the Uganda Railway before the passage of the act; and a liquor license law, which is intended to restrict the sale of intoxicating liquors and which attempts to lessen habitual drunkenness

by requiring the registration of habitual drunkards and the prohibition of the sale of liquor to such persons under heavy penalties.

Coronation of the King and Queen.—The original date set for the coronation was June 26, 1902, but two days before this date announcement was made that the king was seriously ill. The coronation ceremonies and festivities, for which immense preparation had been made, were indefinitely postponed, and consternation fell on all the kingdom and empire. On July 15, His Majesty was able to leave London for a cruise to Cowes, and on July 19 it was announced that the coronation ceremony would take place on Saturday, August 9. Early in the morning of that day, the whole route from Buckingham Palace to Westminster Abbey, where the ceremony took place, was lined with spectators, while all balconies, windows, and places of vantage along the route were fully occupied. Soon after ten o'clock, the first of the three processions composed of carriages conveying members of the royal family and the royal visitors emerged from the palace. This was followed by the Prince of Wales's procession, starting from Marlborough House. Half an hour later, the king and queen left the palace in their state coach, which took its place in the procession, which now moved toward the abbey, preceded and followed by cavalry escort. Within the abbey there had assembled several thousand persons—peers and peeresses in their robes of rank; members of the House of Commons in court dress or uniform; distinguished foreign visitors, members of the diplomatic body, cabinet ministers, privy councillors, judges, civil servants, municipal representatives, and other officials. Soon after ten o'clock a service for the dedication of the regalia took place in Henry VII.'s chapel after which the procession of bishops and clergy moved down the nave to await the arrival of the king. At twelve o'clock the procession entered the western doors of the abbey. The service began with the recognition, the archbishop of Canterbury presenting His Majesty to the assemblage as their undoubted king, at which there was a response of "God save King Edward." The litany having been sung, the communion service followed, including a special prayer for the king with thanksgiving for his restoration to health. After this the archbishop of Canterbury administered the coronation oath. Then followed the ceremonies of anointing, presenting with the spurs and sword, oblation of the sword, investment with the orb, cross and ring, and presentation of the sceptres, after which was the solemn ceremony of crowning. The presentation of the Bible next took place; the benediction was pronounced, and the king was formally enthroned by the archbishops and bishops on King Edward's chair. Homage was then rendered, which ended the crowning of the king. The ceremony of anointing and crowning Queen Alexandra, performed by the archbishop of York, followed, and Her Majesty took her place on her throne on the dais. Their majesties next descended from their thrones, removed their crowns, and partook of the holy communion on the steps of the altar, which ceremony concluded the coronation.

The king and queen, wearing their crowns, left the abbey for the return journey to Buckingham Palace about 2 P.M. In all parts of the kingdom coronation celebrations were held on Saturday, also in the colonies and India and by the British populations in foreign countries. Special services of thanksgiving for the king's recovery and commemorating the coronation were held on Sunday in churches and cathedrals.

Conference of Colonial Premiers.—One of the most notable incidents connected with the coronation of Edward VII. was the conference of the premiers of the British self-governing colonies, which was held at London from June 30 to August 11, and brought about chiefly through the efforts of the colonial secretary, Mr. Chamberlain, who presided over the meetings. Among the questions discussed by the premiers were: The political relations of Great Britain with the colonies; preferential trade and imperial defense; the commercial relations of the empire; the relations of Australia and New Zealand with the other islands of the Pacific; and the general adoption of the metric system of weights and measures throughout the empire. Mr. Chamberlain in his opening speech said the purpose of the meeting was to draw closer the bonds which unite the colonies and the mother country, and to establish and confirm that imperial unity upon which the security of the empire depends. He said he would not press the question of closer political relations, as that must be left to the colonies themselves, but added: "Gentlemen, we do want your aid, we do require your assistance in the administration of this vast empire, which is yours as well as ours. We have borne the burden for many years. We think that our children should assist us to support it, and whenever you make the request to us, be very sure that we shall hasten gladly to call you to our councils." As to imperial defense, Mr. Chamberlain submitted a paper showing that there was an unfair distribution of the burdens of the empire and that the extraordinary share borne by the United Kingdom could not always be carried. In regard to commercial relations he said the government desired to establish the principle of free trade within the empire, but up to that time no proposal so far-reaching had come to them from any of the colonies. On the question of preferential tariff for British goods, he said,

drawing a lesson from Canadian experience: "While we most gratefully accept from you any preference which you may be willing voluntarily to accord us, we cannot bargain with you for it; we cannot pay for it unless you go much further and allow us to enter your home markets on terms of greater equality." The conference held altogether ten sessions and passed a number of resolutions on a variety of subjects, which resolutions are to be submitted to the legislatures of the various colonies concerned. It recommended the holding of similar conferences every four years. It fixed the contributions of the colonies to the imperial navy as follows: Australia, £200,000 per year; New Zealand, £40,000; Cape Colony, £50,000; Natal, £35,000; New-foundland, £4800. Most of these amounts represent increased contributions, as in the case of the quota of Cape Colony, whose grant was raised from £30,000 to £50,000. Various other minor arrangements relative to naval defense were agreed upon. The conference reached no definite agreement on the subject of military defense. A scheme was considered for allotting a certain number of the local forces in the colonies for the purpose of imperial defense in case of an emergency, while some of the colonies agreed to the proposal for imperial reserves, others, such as Canada and Australia, contented themselves with promising to keep their local forces in a state of efficiency, relying on the willingness of the people to assist the imperial government in case of an emergency, as they did in the case of the South African war. With regard to the trade of the empire, the conference agreed upon a policy of establishing in the colonies preferential tariffs on British products; that is to say, between each colony and the mother country the extent of the preferential treatment to vary according to the circumstances of each colony. A resolution was adopted calling for a united contribution (aggregating £80,000) from all the colonies to the memorial to Queen Victoria, each colony to be represented by some distinctive feature. Resolutions were also adopted favoring ship subsidies, the introduction of the metric system of weights and measures throughout the empire, a system of mutual protection for patents, government ownership of ocean cables and cheap postage on newspapers and periodicals between the different parts of the empire.

Political Affairs.—The chief political event during the summer of 1902 was the voluntary retirement on July 13 of Lord Salisbury from the premiership and the immediate selection of his nephew, Mr. Arthur J. Balfour, as his successor. The event occurred shortly after the conclusion of peace with the Boers, and was entirely unexpected. It was well known, however, that on account of Lord Salisbury's advanced age (seventy-three years) the cares of state were beginning to press heavily upon him. The death of the queen, whom he had served as prime minister since 1885 with the exception of two short intervals of three and one-half years, and the conclusion of the war in South Africa, gave him an opportunity to retire without sacrificing the interests of the government. His tenure of the premiership exceeded that of any other prime minister in the history of England with one exception, and during most of the time he united the onerous duties of the foreign office to the grave responsibilities of the premiership. Mr. Balfour upon being tendered the premiership consulted Mr. Chamberlain before accepting the offer, after which he agreed to undertake the task of conducting the government. At a meeting of Unionist members the new prime minister referred to the irreparable loss which the party had sustained in the resignation of Lord Salisbury, and while he could not hope to fill the gap which Lord Salisbury had left, he said he had accepted the task because he believed that he would have the confidence of those with whom he worked. As for future policy he had no pronouncement to make. Changes there might be, but that was not the occasion on which to discuss them. The policy of the Unionists he was sure would remain what it had always been. Several important changes in the cabinet were effected by Mr. Balfour. He himself took the post of first lord of the treasury. Mr. C. T. Ritchie was appointed chancellor of the exchequer in the place of Sir Michael Hicks-Beach. Mr. Akers-Douglas, who had been first commissioner of public works, succeeded Mr. Ritchie as secretary of state for home affairs. The Earl of Dudley was appointed lord lieutenant of Ireland without a seat in the cabinet, Mr. George Wyndham remaining chief secretary for Ireland with a seat in the cabinet. The Marquis of Londonderry became president of the board of education, being succeeded in the postmaster-generalship by Austen Chamberlain, son of the colonial secretary. The other appointments are: William H. Fisher, financial secretary of the treasury; Sir A. F. Acland-Hood, chief government whip; Earl Percy, under-secretary for India; T. H. Cochrane, under-secretary of the home office; Lord Hardwicke, under-secretary of the war office; Sir William Anson, secretary of the board of education; Andrew B. Law, secretary of the board of trade, and William Henry Forster, commissioner of the treasury.

In a number of by-elections held subsequent to the accession of Mr. Balfour, the government was defeated chiefly on the education issue, the Irish policy, and the Boer war. In all these constituencies there had formerly been safe Conservative or Unionist majorities. The municipal elections in England and Wales occurred early

in November. In thirty-seven cases no contests took place. In the political contests the Liberals gained eighty-four seats and the Conservatives fifty-four, the educational question being the chief issue in many cases.

Foreign Relations.—Under this head the most important event in 1902 was the conclusion of peace in South Africa. Negotiations for this purpose began in January with the proffered mediation of the government of the Netherlands, which the British government declined, saying that it could not accept the intervention of any foreign power in the war. The government decided that peace negotiations must take place not in Europe but in South Africa. After various preliminary agreements a conference of sixty Boer delegates elected by the commandoes, assembled at Vereeniging, May 15, from which a special commission consisting of Generals Botha, De Wet, Delarey, Smuts, and Herzog was deputed to negotiate with Lord Milner and Lord Kitchener. The commissioners asked for self government under British supervision, stating that they were prepared to surrender part of their territory and their independence as regarded foreign relations. This request Lords Milner and Kitchener refused to consider, and eventually articles of peace were agreed upon, and these were accepted by the conference of Vereeniging May 30. The terms of peace were announced in the House of Commons on June 2 by Mr. Balfour. See TRANSVAAL.

Other matters of note in the foreign affairs of Great Britain were the conclusion of a treaty with Japan for the maintenance of the integrity of China and Corea and for the preservation of British and Japanese interests therein (see JAPAN); the adhesion of the British government to the Brussels sugar convention for putting an end to the inconveniences resulting from the grant of excessive bounties on the production of sugar; the conclusion of a commercial treaty with China providing for valuable trading privileges in the Far East and perfecting arrangements for the withdrawal of British forces from Shanghai; and the conclusion of a treaty with the Emperor of Abyssinia for delimiting the frontier between that country and the Soudan. A long-standing difference between Chile and the Argentine Republic with regard to their frontiers was settled by the arbitration of King Edward. In eastern Africa British operations were undertaken to check the depredations committed by the Mad Mullah Abdullah against the tribes under the protection of Great Britain. In this undertaking Great Britain was aided by the cooperation of the government of Italy (see SOMALILAND). The relations of England with Venezuela have been strained on account of alleged unjustifiable and arbitrary acts against British subjects and property during the course of the last two years. The government finally acting in concert with that of Germany, demanded redress, which was conceded (see VENEZUELA). An amicable settlement of the British-French West African dispute concerning the "Waima affair," was effected by arbitration through the decision of the Belgian minister of state in December. An alliance between Great Britain and Portugal with regard to South African affairs was recently announced, while the understanding between Great Britain and Italy with regard to affairs in the Mediterranean was superseded by the new Franco-Italian agreement. See ITALY (paragraph Foreign Affairs).

An incident in the relations between Great Britain and Germany was an outburst of ill-feeling and resentment among the Germans against Great Britain on account of some remarks made by Mr. Chamberlain in justification of British methods in South Africa and his allusion to Germany's treatment of France in 1870-71. These remarks were made the occasion for angry denunciations of the British government by the German press, and the matter was taken up in the Reichstag where Chancellor von Bülow characterized the British government rather severely and with some show of resentment.

Mosely Commission.—This was a commission of British labor leaders organized by Alfred Mosely, which visited America in November, 1902, to study American industries and the condition of American workmen. Mr. Mosely invited representatives from the largest trade unions to join the commission. In most cases, the unions sent their general secretary to represent them. The inquiries of the commission were facilitated by the assistance of prominent men, trade unions in various cities, the Civic Federation, and the American Federation of Labor. One of the first results of the tour is likely to be the organization in England of a body similar in object to the Civic Federation of America. The commission thoroughly investigated the work of this body, and as a result of their investigations, passed unanimously on November 30 a resolution declaring that such an organization would be a benefit to both employer and employed. It would not interfere with the bodies that already exist for mediation and conciliation, but would make it a duty to get information of the first sign of a dispute, and to bring the parties together at round-table conferences, and to investigate each other's conditions and points of view with the hope of eliminating prejudice and bringing vexed questions to a satisfactory outcome. The superiority of the American industrial system seems to have been established

beyond doubt. It was Mr. Mosely's opinion that the American worked harder and was better trained and educated than the Briton. He thinks the British workingman suffers from a lack of what he calls the crowning glory of American civilization—a highly developed system of public education. As the American manufacturer works his men harder and pays them more liberally, he is more ready to install new or improved machinery at the first suggestion of need or advantage. Mr. Mosely also contrasted the eagerness of the American man with capital to invest it in productive enterprise with the unwillingness of the wealthy Briton to enter "trade," even to grant for commercial uses natural advantages which might lie on the edge of his vast estate. The commission returned to England December 21, 1902, and its report was in preparation at the end of the year.

Irish Affairs.—During 1902 the situation in Ireland continued to grow more serious. Early in the year a series of disturbances arose out of the agitation of the United Irish League and took the form of intimidation, boycotting, refusal to pay rent, and general lawlessness. At length, in April, the government authorized coercive measures in certain districts which involved a change of venue at the option of the crown, summary jurisdiction, special juries, and the suppression of obnoxious newspapers and branches of the league as dangerous associations. In September, on account of the increase of the disturbances, these measures were extended to five additional counties including the city of Dublin. This action of the government was the subject of loud protest upon the part of the Irish, who denied that the situation demanded such high-handed action. The attempt to arrest certain Irish members of Parliament who were conspicuous in the disturbances, was resisted and in several cases led to riots. At one time during the year more than thirty Nationalists, including eight members of Parliament, were either undergoing punishment or awaiting sentence for conspiracy in connection with tenant troubles or for sedition. Among these was John O'Donnell, member of Parliament for the county of Mayo, who was sentenced to three months' imprisonment at hard labor for intimidation and inciting to boycotting, and to an additional three months in default of bail for good behavior. His arrest caused considerable excitement throughout the island and provoked loud threats among members of the United Irish League. In September Edmund Burke, M.P., and Michael Reddy, M.P., were sentenced to five months' imprisonment at hard labor for intimidation. About the same time P. A. McHugh, M.P., editor of the *Sligo Champion*, was sentenced to two months' imprisonment at hard labor, having been convicted of conspiracy and intimidation. Upon the reopening of Parliament, October 16, the Irish members created a disturbance, one member going almost to the length of assaulting the prime minister, Mr. Balfour. The premier had announced that the remainder of the session would be devoted entirely to government business, which he explained would consist mainly of the discussion of the education and London water bills, while the Indian budget, the Uganda Railway, sugar bounties, the supply vote, and the Transvaal would also require attention. Thereupon Mr. Bryce, acting as leader of the Liberals, made a mild protest which was followed by an outbreak from the Irish members. Impassioned speeches of denunciation were made by Irish members, outbursts of applause alternated with hisses, and one of the members, O'Donnell, refused to obey the speaker and shook his fist vigorously in the face of Mr. Balfour, whom he denounced for neglecting the interests of Ireland in the programme which had been mapped out. O'Donnell was suspended by a vote of 341 to 51. The Irish members continued to demand a day for the discussion of Irish affairs and especially the Crimes act, which had been applied to a large part of the country. With the aid of a number of Liberal members the Irish demands finally received recognition and an understanding was reached by which it was agreed that a day should be set upon for the discussion of the Crimes act. In the course of the discussion, Sir Henry Campbell-Bannerman denounced the policy of the government and declared that after ten years of resolute government in Ireland the island had a Crimes act for its magna charta and a Sergeant Sheridan as the embodiment of law and order. O'Brien, an Irish leader, argued that the harsh administration of the act was endangering the peace of Ireland, and insisted that Dublin was much more peaceable than Birmingham, declared that the Irish were prepared to make generous terms with the landlords, and accused the chief secretary for Ireland, Mr. Wyndham, of employing England's power to enable the territorial magnates to play their own game. A comprehensive measure for the settlement of the Irish land question was debated at length in Parliament. As originally introduced, it provided for the sale of the interests of landlords in land occupied by tenants to the tenants occupying them. The Irish members insisted that the measure be modified so as to make the sale compulsory and that the congested-districts board be recognized and given compulsory powers of acquiring land. The government refused to say that voluntary purchase had worked well so far as it had been tried. The failure to pass the measure created widespread discontent throughout the island and was the cause

of much agitation. Nevertheless, at the close of the year the legislative programme had more promise for the betterment of the Irish tenantry.

GREECE, a constitutional monarchy in Southeastern Europe, lying between the Ionian and Aegean seas. The capital is Athens.

Area and Population.—The area is 25,014 square miles, and the population at the last official census (1896) was 2,433,806. Athens had at that time 111,486 inhabitants, Piræus 42,169, and Patras 37,958. It was reported in 1901-02 that the emigration of young men of the agricultural class had assumed such proportions as to cause fears for its serious consequences upon the country. A great part of the population are adherents of the Greek Orthodox Church, the declared religion of the State, but complete liberty of worship is guaranteed all other sects. There is an organized system of primary schools in which attendance is nominally compulsory, trade, technical, and agricultural schools, and a university at Athens with 2853 students.

Government.—The executive authority is vested in a king, assisted by a responsible ministry of seven members. The legislative body, the *Boulé*, consists of a single chamber of 207 members, elected by manhood suffrage. The reigning sovereign, George I., son of King Christian IX. of Denmark, was elected king by the Greek national assembly in 1863.

Army and Navy.—All able-bodied men over twenty-one years old are liable for military service. The regular army consists (1902) of 22,000 officers and men, and on a war footing can be recruited to 82,000. The navy consists of five armor-clads, seven torpedo boats, and a number of unprotected vessels, manned by 3782 officers and men.

Finance.—Since the war with Turkey (1897) the finances of Greece have been in the hands of an international commission at Athens, consisting of representatives of the six mediating Powers. The monetary unit is the gold drachma, worth 19.3 cents; the paper drachma has a fluctuating value of about two-thirds of a gold drachma. The revenue and expenditure in currency value (1900) were 112,206,849 drachmai and 114,088,468 drachmai, respectively, and the estimates in the budget of 1902 were 123,949,931 and 121,885,707, respectively. The revenue is derived chiefly from direct and indirect imports, stamp taxes, and monopolies. The largest items of expense are for service of the public debt (estimated at 33,532,060 drachmai for 1902), and for the departments of war and the interior. The public debt (December 31, 1901) amounted to 695,220,500 drachmai gold and 169,157,573 drachmai currency, and is being steadily reduced. Gold and silver coin has practically disappeared from circulation and has been replaced by a forced note circulation of about 150,000,000 drachmai.

Industries, Commerce, etc.—Agriculture is the chief industry, although in a backward state, and manufactures have made but little progress. The principal crop is currants, the exports of which for the year ending July, 1902, was about 150,000,000 pounds. Other products of importance are wheat, barley, oil, fruits, magnesium, emery, marble, and sponges. The imports increased in value from 131,385,000 drachmai in 1900 to 138,765,000 drachmai in 1901, and the exports decreased from 102,739,000 to 93,781,000 in the same period. The values in drachmai of the chief articles of export in 1901 were: Currants, 41,191,000 (52,890,450 in 1900); minerals, 19,166; olive oil, 4,620,000; and tobacco, 4,114,000. The trade is largely with Russia, Great Britain, Austria-Hungary, Germany, Turkey, and France. The American consul at Athens says that probably one-fourth to one-third of the imports from Germany are really American goods imported by German merchants and re-shipped to Greece as German articles. The merchant marine consisted (1901) of 1064 vessels of 299,407 tons.

There are 696 miles of railway open for traffic. In March, 1902, a company was chartered for the construction of the "Piræus Railway" from Athens to Demerly, which, it is intended, shall ultimately connect Greece with the general European system. The corporation has a capital stock of 10,000,000 drachmai, and to further the construction a loan of 35,000,000 francs will be floated. The completion of the road, which was projected several years ago, is looked forward to as an event of the greatest importance in the economic development of the country.

HISTORY.

Revival of Brigandage.—During the year 1902 there was an alarming revival of brigandage in the country, especially in the western Morea and Thessaly. In many cases the outlaws were said to be in collusion with citizens in the large towns, and the peasants through fear or sympathy furnish them with provisions and give them warning of the approach of the law officers or provide hiding places for them. An extensive system of extorting money from merchants and wealthy inhabitants by threats has been practised with success. The officials seem to

be unable or unwilling to cope with the growing evil. This state of internal disorder is given as one reason for the large increase of emigration to the United States noted during the year, which the government is desirous of checking because it is draining whole districts of the able-bodied, energetic males of the rising generation.

Foreign Relations.—In the summer of 1902 it was reported that Greek and Turkish diplomats, after several years of untiring efforts, had succeeded in re-establishing fairly cordial relations between the two governments. This condition of affairs was not considered, however, as any real guarantee of a lasting peace, as the attitude of Greece was doubtless prompted more by fear of the nationalistic and expansive designs of Bulgaria than by any newly discovered love for the Turk. A new difficulty, moreover, was presented in the decision of the Porte to prohibit foreign fishing in Turkish waters. Prince Mavrocordato, the Greek minister at Constantinople, was instructed to take action in the matter, but serious difficulties arose in the course of the negotiations, and the prince suddenly left Constantinople for Athens, where it was reported that he was not likely to return. The decision of the Turkish government to suppress the sponge fishing off the coast of Tripoli, although undoubtedly aimed against the Italians, threatened with ruin many thousands of Greeks on the islands of Ægina, Spetsai, and Psara, and for their protection a Greek warship was dispatched to the Tripolitan coast. Toward the close of the year it was announced that diplomatic relations between Greece and Persia were about to be resumed after an interval of non-intercourse extending over 2393 years—that is, since B.C. 491, when Darius sent heralds to Athens demanding submission to the Persians. Of course, this mission of the heralds differed somewhat from modern diplomatic intercourse. An event not without significance and one that gave great pleasure to the pro-Russian party in the country, was the marriage on August 29, 1902, at St. Petersburg, of Prince Nicholas, the third son of King George, and the Grand Duchess Hélène, daughter of the Grand Duke Vladimir, and thus a cousin of the Czar.

Political Affairs.—The ministry of M. Zaimis, which was formed in November, 1901, in order to allay the popular agitation following the riots arising from the differences in connection with the translation of the Gospels into modern Greek, restored order with but little opposition, and the decision reached in October, 1902, to prosecute one student, four gendarmes, and four civilians who were concerned in the disturbances was apparently accepted by all parties as a satisfactory ending to a troublesome affair. Aside from this, however, the Zaimist ministry was not popular and was able to accomplish little more, in the face of rather desultory opposition, than had its predecessor, the ministry of M. Theotokis. The Theotokists, who had voluntarily given up their power, not because there was an adverse parliamentary majority against them but merely because it seemed advisable to place the settlement of the Bible difficulties in new hands, were little inclined to lend their support to any measures likely to give the Zaimists a long lease of power. The elections of November 30, 1902, following the dissolution of the chamber, resulted in the choice of 82 Delyannists, 75 Theotokists, and 46 Zaimists. As the ministerial party had thus a smaller number of supporters than either of the other two groups, M. Zaimis handed in the resignation of himself and his colleagues on December 1. On December 5, the king called upon M. Delyanni, the veteran statesman, to form a ministry. M. Delyanni, now over eighty years old, has been a power in Greece for a quarter of a century, but he had not been in office since the disastrous ending of the Græco-Turkish war. With the strong parliamentary following that the elections gave him, however, it was thought that he could command a working majority, and he therefore accepted the task. That the opposition, particularly the Theotokists, had determined on a radical policy to break up the new ministry, was shown on the reopening of the chamber on December 23, 1902. The Theotokists had retained possession of the keys to the legislative hall, and determined on a *coup*, which consisted of nothing less than to take possession of the hall in the early morning before the arrival of the Delyannists and elect the senior member of their own party president of the body. In this they counted on the support of some members of the Zaimist group, which had owed its lease of power during 1901-02 to the voluntary giving way of the Theotokists. The Delyannists, however, were informed of the plot, and at a midnight ministerial meeting it was determined to forestall the action of the opposition by forcing the doors. This was done, and when the Theotokists arrived, at 7 o'clock, they found M. Tsarlambas, a Delyannist, installed as president, and the ministerial deputies all in their seats. When the Metropolitan began the customary opening prayer, he was interrupted by a Theotokist deputy, who arose and loudly denounced the action of the ministry. In the uproar that followed blows were exchanged, and an inkstand that was hurled across the chamber fell into the holy-water font. The Theotokists finally withdrew, under protest, order was restored, and the king entered and read the speech from the throne. See ARCHÆOLOGY.

GREEK CHURCH. The constituency of the Greek Church, which comprises the Orthodox Greek Church and the Russian Orthodox Church, is estimated at 100,000,000. In the United States the Russian branch is represented by 40 ministers, 31 churches, and 40,000 communicants; the Orthodox Greek Church by 8 ministers and 9 churches with a membership of 21,230, a noteworthy gain over 1901. The dedication of a Russian Orthodox church in New York City in 1902 was significant of the growth of that church in the East, its stronghold having been, hitherto, Alaska and the Pacific coast of North America.

GREENLAND, a Danish island, the largest in the world after Australia, has an area variously estimated at from about 500,000 to over 800,000 square miles. The colonized area, which extends along the west coast from about 60° to about 72° north latitude, is stated at 46,740 square miles, and its population (1895) at 10,639. The commerce is a government monopoly. The exports include seal, cod, and whale-oil, seal and fox skins, and eiderdown. In 1900 imports from and exports to Denmark were valued at 831,000 kroner and 340,000 kroner, respectively (the krone is worth 26.8 cents). See ARCTIC EXPLORATION.

GRENADA. See WINDWARD ISLANDS.

GRÉVILLE, HENRI, the pseudonym of Alice Marie Celeste Durand (*q.v.*).

GRIFFIN, SIMON GOODELL, a major-general in the Union army during the Civil War, died January 14, 1902, at Keene, N. H. He was born August 9, 1824, in Nelson, N. H., and after a boyhood spent on a farm became a teacher, was admitted to the bar in 1860, and at the beginning of the Civil War was commissioned captain in the Second New Hampshire Volunteers. In 1862 he was promoted lieutenant-colonel in the Sixth New Hampshire, which he commanded in the second battle of Bull Run, at Antietam, and at Fredericksburg. He commanded a brigade at Vicksburg, and in 1864 was commissioned a brigadier-general of volunteers. For gallantry in the assault on "Fort Hell" (April 2, 1865), he was brevetted major-general of volunteers. At the close of the war he declined a major's commission in the regular army and returned to Keene. He was a member of the State legislature for five terms, during two of which he was speaker of the house.

GUADELOUPE, a French colony in the West Indies consisting of the two islands of Basse-Terre and Grande-Terre, and five small adjacent islands. The total area is 688 square miles, and the population (1901) 182,112. The capital is Basse-Terre, with 7838 inhabitants. The colony is administered by a governor and an elected council and is represented by a senator and two deputies in the French parliament. The colonial revenue and expenditure balanced in the budget of 1900 at 6,120,581 francs, and the expenditure of France on the colony, according to the budget of 1902, amounted to 1,737,289 francs. There is a colonial debt of 1,200,000 francs. The imports in 1899 were valued at 19,155,751 francs, and the exports at 18,707,558 francs, the principal articles in the latter being sugar, 39,390 tons; coffee, 1,587,000 pounds, and cacao-beans, 915,530 pounds. The chief product is sugar, in the culture of which 24,153 persons were employed.

GUAM, the largest and most southerly of the Ladrone, or Marianne, Islands, ceded by Spain to the United States by the treaty of Paris in 1898, is situated about 5000 miles west of San Francisco, and 1500 miles east of the Philippines. It has an area estimated at 150 square miles, and a population of about 10,000, of whom 6400 live in Agaña, the capital. The island is administered by a United States naval officer, under direction of the navy department. The present governor is Commander Seaton Schroeder. The chief importance of the island lies in its value as a naval base and coaling station on the direct line between the United States and the Philippines. Sugar, rice, corn, wheat, figs, indigo, coffee, cotton, and cocoanuts are produced, but very little of the island is under cultivation, although at least half of it is arable. The only product that has ever been exported to any extent is copra, but its production has been insufficient during the past two years even to supply the home demand. There are no records of the exports, but the imports of merchandise from the United States were valued in 1902 at \$23,964. Extensive naval docks and storehouses are in process of erection at Apra (or Piti), the port of Agaña, by the United States government.

On September 22, 1902, a severe earthquake occurred on the island, which resulted in the destruction of a great deal of native property, and in damage to the United States naval station and insular public buildings to the extent of about \$50,000. There was little or no loss of life, but the damage to native crops was so great that it seemed probable that government aid would be required during the ensuing season. The shocks, of which between 100 and 150 were recorded, recurred at intervals for a week or more.

On December 15, 1902, Senator Joseph B. Foraker, of Ohio, introduced in the Senate a bill to provide a new form of government for Guam, by which the

President is vested with authority to select a person or persons who shall exercise all jurisdiction, civil, military, and judicial, necessary for the island's proper government. A further provision reduces the tariff on articles imported from Guam to 50 per cent. of the Dingley tariff rates. The annual report of the governor, Commander Schroeder, dated July 16, was received at Washington, December 26, and shows the condition of the island to be rather unsatisfactory. The receipts for the fiscal year 1901-02 were about \$66,000 and the expenditures \$57,000, leaving a balance on hand of \$8,000—which is, however, a decrease of over \$13,000 from the surplus for the preceding year. All work on public improvements had necessarily been abandoned, owing to the failure of Congress to make appropriations. The governor asked for an appropriation of \$40,000 for public improvements, a request which the subsequent losses from the earthquakes in September probably makes much more pressing.

GUATEMALA, the most northern and western republic of Central America. The capital is Guatemala City.

Area and Population.—Guatemala has an estimated area of 48,300 square miles and an estimated population of over 1,574,000. About 60 per cent. of the inhabitants are Indians and most of the remainder mestizos. The reported number of public schools in 1900 was 1030.

Government.—The executive authority is vested in a president, who is assisted by a cabinet of six members. In 1902 the president was Señor Manuel Estrada Cabrera, who as vice-president succeeded to the executive office in March, 1898, and in September of the same year was elected for the six-year term ending March 15, 1905. The legislative power rests with an assembly elected by popular vote and with a council whose members are chosen in part by the assembly and in part by the president. The regular army comprises about 7000 officers and men, and the effective army nearly 57,000.

Finance.—The monetary unit is the silver peso, worth 42.8 cents on October 1, 1901, and 38.4 cents on October 1, 1902. The silver peso, however, is no longer in ordinary circulation. The money in use is the fluctuating paper peso and fractional nickel coins. In 1902 the value of the paper peso, which is used in statements of customs and internal revenues, was about 15 cents in United States money. Revenue accrues chiefly from customs and taxes on alcoholic liquors and tobacco; the largest items of expenditure are for service of the debt, public instruction, and war. The total revenue and expenditure for the fiscal year 1900 are reported at 11,964,168 pesos and 11,870,667 pesos, respectively; for the fiscal year 1902 the estimated expenditure was 13,438,110 pesos; for the fiscal year 1903, revenue 14,555,000 pesos and expenditure 15,547,247 pesos. The foreign debt in 1902 was reported as about \$8,226,000; the internal debt amounts to over 28,000,000 pesos (silver).

Production and Commerce.—The leading products are coffee (largely controlled by German capital), sugar, corn, bananas, tobacco, and cacao. Imports and exports, valued in gold pesos worth approximately one dollar, are reported at 4,117,659 and 8,370,555, respectively, for 1899, and 3,127,102 and 7,393,204, respectively, for 1900. The coffee export in the latter year amounted to nearly 73,000,000 pounds, valued at 6,485,936 pesos gold. Other exports were rubber, hides, sugar, and cabinet woods. The principal imports are cotton goods, flour and provisions, alcoholic liquors, and iron and steel goods. The United States is first in the import trade, and Germany in the export.

Railways.—In the spring of 1902 there were reported 342 miles of railway in operation, of which 159 miles comprised Pacific lines. The Northern Railway, projected from Puerto Barrios to Guatemala City, 193 miles distant, had reached Sanarte. This left a gap of only 34 miles in a line of railway connecting the Caribbean coast with the Pacific at San José. The southern section of this line, the Central Railway, running from San José to Guatemala City, is 74 miles in length. The total distance accordingly between the coasts is 267 miles. Other railways are projected and under construction.

History.—Exceedingly disastrous earthquakes, beginning on April 18, 1902, and continuing with varied degrees of violence until April 24, appear to have been a calamity second only to the volcanic disasters in the West Indies during the following month. The extraordinary horror of the latter disasters, however, and the absence of cable communications with Guatemala led to less discussion of the earthquakes in the public prints. The shocks destroyed eight cities, including Quezaltenango, San Marcos, Mazatenango, Solola, Santa Lucia, and San Felipe, while thousands of people were killed and thousands left destitute. Indeed much damage was done through a large part of the republic, and the machinery on many of the chief coffee-growing plantations was seriously injured. Before the earthquake of April 18, indications pointed to a very large coffee crop, but so great was the damage done that hardly more than half a crop could be expected. Widespread commercial depression ensued, due in part to the earthquakes and in part to

scarcity of labor. Many laborers went to Mexico and Salvador, where wages are paid in silver instead of in a depreciated paper currency, as in Guatemala. The government took measures immediately for repairing the damage done by the earthquakes. On April 24, 1902, the congress enacted a law providing for the amelioration of conditions in the districts that had suffered from the earthquake of April 18. This law provided for an increase in the customs duties on various luxuries, exempted from taxation for a period of five years the urban properties of the injured communities, for a like period released the inhabitants of such communities from all personal service to the State, and for two years removed the import duties from the more important building materials. On May 2, 1902, when the ruins of Quezaltenango, which had been entirely destroyed, were still smoking, President Cabrera issued a decree ordering the rebuilding of the city. Work was immediately begun, and on San Marcos as well.

Later in 1902 Guatemala suffered another disaster which in the persistence of its effects, at least, was even worse than the earthquakes of April. On October 24 the volcano of Santa Maria, which is between Quezaltenango and Retalhuleu, and about 50 miles from the Pacific, became active, and eruptions, accompanied by earthquake shocks, continued with more or less violence till November 9. Santa Maria, which is in the important coffee zone, is perhaps 10,000 feet high. The city of Quezaltenango lies about 7000 or 8000 feet above the sea. Coffee grows best, in Guatemala, at an elevation of from 2000 to 4000 feet; hence the departments of Quezaltenango and Tumbador were admirably adapted for its cultivation. And it was this region that suffered most from both the earthquakes and the volcano. It was in this section also that German capital was heavily invested in coffee. Little or no lava seems to have been thrown out by the volcano, but there were enormous quantities of ashes, sand, and poisonous gases. Although the Guatemalan authorities tried to minimize the reports of damage done, it seems that several towns and villages were ruined wholly or in part. It was stated that every vestige of life within a radius of thirty miles was destroyed, and that miles of plantations (chiefly coffee) in the districts of Costa Cuca, Chuva, Reforma, Palmar, Kouhutz, and Costa Granda, were buried in ashes and débris, many places to the depth of seven feet. Thousands of domestic animals were killed, and some 7000 people (mostly Indians), it was stated, were asphyxiated or buried beneath the volcanic débris. After the eruption great distress prevailed among the survivors, of whom 10,000 were said to be in danger of starvation. Bands of robbers, moreover, plundered and murdered refugees and looted abandoned plantations. It is likely that the country would have recovered fairly rapidly from the damage wrought by the April earthquakes, but that done by the volcano, since so much of the best land was covered with sterile débris, it will probably take years to repair.

An attempt in April, 1902, on the part of Germany, France, and Great Britain to collect debts due from the Guatemalan government created much discontent. The pressure brought to bear by Great Britain was responded to by a popular outbreak, so that on the 18th of the month two parties of armed British sailors were landed from the cruiser *Grafton* at San José. Settlement was then made to Great Britain, France, and Germany. This proved to be a serious drain on the treasury, necessitating an extra gold import duty of 30 per cent. This duty had a considerable part in bringing about the stagnation of business mentioned above. On November 22, 1902, the son of United States Minister Hunter shot and killed an American named Fitzgerald in Guatemala City, and then took refuge at the United States legation.

GUIANA. See **BRITISH GUIANA**, **DUTCH GUIANA**, and **FRENCH GUIANA**.

GYMNASTICS has become an important sphere of intercollegiate competition since the formation of the Intercollegiate Gymnastic Association in 1899. In 1902 the fourth and most successful contest was held in Philadelphia, March 21, and was won by Yale, with 16 points. The other scores were: Columbia, 15; Princeton, 10; New York University, 5; Pennsylvania, 5; Haverford, 3. The several events were won as follows: Horizontal bar, tie between G. W. Albin and R. T. Hinton, Yale; club-swinging, G. P. A. Brayden, New York University; parallel bars, tie between W. L. Benham, Columbia, and P. A. Moore, Princeton; tumbling, R. T. Hinton, Yale; side horse, J. C. Smallwood, Columbia; flying rings, P. M. Kempf, Pennsylvania. The championship of the Amateur Athletic Union was contested in New York City in April. The winners were: Horizontal bar, E. C. Brendlin; parallel bars, J. Buner, rope-climbing, E. Kumath; side horse, J. Buner; flying rings, E. Kumath; tumbling, P. R. E. Stefer; long horse, A. Jaboda; club swinging, F. Metz, Jr.

HAILSTORM PREVENTION. See **AGRICULTURE** (last paragraph of section on Plant Production).

HAITI, a republic occupying the western and smaller portion of the island of the same name, the eastern portion being occupied by Santo Domingo (*q.v.*). It has an area of 10,204 square miles, and a population of 1,244,650 (1901), of whom over 90 per cent. are negroes, and most of the remainder mulattoes. The capital, Port-au-Prince, has a population of 70,000, the only other large towns being Cape Haiti, population 29,000, and Les Cayes, population, 25,000. The Roman Catholic is the predominating religion, and the language spoken a debased French dialect. The president (in 1902 Gen. Boisrond Canal), in whom is vested the executive power, is elected for a term of seven years in joint session of the legislature, which consists of a chamber of representatives, elected by popular vote, and a senate chosen by the chamber.

The revenue is derived almost entirely from customs, the export duties being payable in American gold, and the import duties in paper. In the budget estimates for 1901-02 the revenue amounted to 4,409,318 dollars paper and 2,917,435 dollars gold, and the expenditure to 4,422,816 dollars paper and 2,918,490 dollars gold. The public debt (December 31, 1901) was 23,223,466 dollars gold and 4,737,783 dollars paper. The paper money circulation amounted (1899) to 3,749,000 dollars. Agriculture is the principal industry, and coffee, cacao, logwood, honey, hides and cotton are produced. The imports in 1900 were valued at 5,750,000 dollars, and the exports at 11,200,000 dollars. Coffee is the most important export, amounting in 1900 to 72,122,781 pounds, but the development has been checked by the heavy export duty of \$3.80 per 100 pounds. Two-thirds of the trade is with the United States. There are only fifteen miles of railway in operation, but additional lines are projected which will in time connect with the Santo Domingo system. It is unlikely that the construction will be undertaken, however, in the prevailing state of political unrest.

History.—The republic of Haiti was, during 1902, the scene of another one of its periodical revolutions, this time apparently rather more severe than usual. The immediate occasion of the present outbreak seems to have been the announcement made by Gen. Tiresias Sam in March, that he intended to hold the office of president after the expiration of the term for which, according to general understanding, he was elected. He justified his proposed course by an ambiguity in the constitution. General Sam, who had served as minister of war for President Hippolyte, was elected to succeed him in April, 1896. The constitutional term is seven years, and a second term is not allowed. General Sam now asserted that the two years he served to fill out the unexpired portion of Hippolyte's term do not count toward his own seven years. This astonishing interpretation increased the ill-feeling and discontent which have existed for some time. At Jacmel, a port on the southern coast, the unrest finally, toward the end of March, assumed the form of an open revolt. To quell this insurrection General Le Conte was sent to Jacmel. He took the town, but on April 5 was himself attacked and driven out of the town by a force of revolutionists under Gen. Nicholas Baptiste, who, after sacking the town, retired to the hills. The minister of war, Gen. Victor Guillaume, thereupon marched south with a second column, and on April 12 met the rebels in a battle in which 100 of the latter were killed. General Baptiste was taken prisoner and shot. The little gunboat *Crête-à-Pierrot*, which constituted the principal part of the Haitian fleet, was dispatched to Jacmel, and anchored in the harbor. At Port-au-Prince there was no actual outbreak at the time, but several officials were imprisoned on suspicion. The unrest was evident enough, however, in every part of the republic, and this President Sam realized. He had adopted the course of most Latin-American political leaders of laying up something for a rainy day. His enemies declared that he had bought securities valued at over a quarter of a million dollars in the past three years. At any rate, the life of a retired revolutionist, living on his hard-earned fortune in the comparative quiet of Paris, appealed to him as a much pleasanter existence than that of head of the turbulent negro republic that, since its establishment, has never allowed one of its presidents to serve out his seven-year term in peace. He therefore resigned office early in May, and on the 15th of the month sailed with his wife for Paris, leaving his countrymen to settle his succession in whatever way they chose. They generally choose to settle such things by force of arms in Haiti, and that was exactly what occurred in the present instance. Three days before his departure, the Haitian congress met at Port-au-Prince to choose a successor, but the disorder was so great and the quarrels of the opposing factions so bitter that it was at once seen that nothing could be expected of them. Several of Sam's former ministers and a number of prominent army officers therefore met and formed a provisional government, with Gen. Boisrond Canal, a former president, as provisional president; and Gen. Alexis Nord as minister of war. But instead of settling the difficulty, the organization of the provisional government appears rather to have precipitated trouble. General Firmin, who has for several years been a rather disturbing factor in Haitian affairs,

refused to acknowledge the legitimacy of the provisional government, declared himself the liberator of the republic, and assumed the title of president. His cause was greatly strengthened later, when Admiral Killick, a Scotch-Haitian, declared for his candidacy and placed his "fleet"—i.e., the gunboat *Crête-à-Pierrot*—at his command. General Firmin gathered an army and advanced on the capital, and Admiral Killick declared a blockade of the entire coast. The action of the latter called forth a warning from Commander McCrea, of the United States gunboat *Machias*, that he must obey the rules of international war or be considered a pirate. During July the only engagement of importance occurred when General Colin of the Canal-Nord provisional government defeated and turned back a Firminist force under General Jumeau, who were advancing on Cape Haytien. Early in September the revolution, which had been dragging along in a desultory fashion during August, was brought sharply to the public attention by a startling incident. The gunboat *Crête-à-Pierrot*, under Admiral Killick, was rendering valuable aid to the Firminist cause. On September 2, in pursuance of the plan of attempted blockade, the gunboat seized the German merchant steamship *Markomannia*, which was carrying munitions of war to the Haitian provisional government. On September 6 the German gunboat *Panther* overhauled the *Crête-à-Pierrot* in the harbor of Gonaives and demanded its surrender. Admiral Killick, realizing that defense was useless, according to the newspaper reports, personally fired one of the magazines. The *Panther* thereupon opened fire on the Haitian vessel, and completed its destruction, the brave admiral and part of his crew going down with the ship. Weakened by the loss of his "navy" and by the fall of St. Marc, which capitulated to General Nord in October, General Firmin abandoned his attempt to obtain control of the government, and embarked with a few of his followers for a place of refuge in the Bahamas. General Alexis Nord, who had been minister of war in the provisional cabinet, thereupon entered Port-au-Prince at the head of the army, congress was convened and toward the end of December he was elected president. Reports, however, suggested that the presence of an army which, for the time being, is devoted to Nord's interests, had more to do with bringing congress to a decision in his favor than any personal or political popularity of Nord himself.

HALL, CHRISTOPHER NEWMAN, an English clergyman of the Congregational church, died in London February 18, 1902. He was born at Maidstone, Kent, May 22, 1816; was educated at Highbury College and London University (A.B., 1841), was first pastor of the Albion Congregational Church at Hull from 1842 to 1854, and in the latter year became minister of the Surrey Chapel (Rowland Hill's). His congregation removed in 1876 to Christ Church, Lambeth, and he continued in the pastorate until his resignation in 1892, when he became a general evangelist. In 1866 he was chairman of the Congregational Union. During the Civil War he preached and lectured in England against secession, and upon a subsequent visit to the United States was received with many marks of esteem. He received the degree of D.D. from Edinburgh, and published the tracts: *Come to Jesus* (1846; in 1891 it was estimated that 3,000,000 copies had been circulated in about twenty languages); *Follow Jesus* (of which 246,000 copies in the English edition had been circulated by 1885); the volumes *The Land of the Forum and the Vatican* (1852; new ed., 1859), a description of travel, and *The Lord's Prayer: A Practical Meditation* (1883; 2d ed., 1889); and other writings.

HAMOUD BIN MAHOMED BIN SAÏD, Sultan of Zanzibar, died in Zanzibar, July 18, 1902. He was born in 1853, and upon the death of his cousin, Hamed bin Thwain, in August, 1896, succeeded to the throne. Another cousin, Saïd Khalid, had proclaimed himself ruler, but, although not recognized by other powers, had to be expelled by force, in the form of interposition by Great Britain, which maintains a protectorate over Zanzibar. On account of his peaceful temperament and perfect amenability to British counsel, Hamoud's reign was undisturbed by political or other troubles.

HAMPTON, WADE, a Confederate soldier and ex-Senator from South Carolina, died April 11, 1902, at Columbia, S. C., where he was born March 12, 1818. He came from an old fighting stock prominent in the history of the State, his grandfather having fought in the Revolution and held a major-general's commission in the War of 1812, in which his father also served with distinction. He graduated at the University of South Carolina, studied law—without the intention of practising it, however—and devoted himself to politics. He inherited extensive plantations in South Carolina and Mississippi, and, although one of the largest slave-holders in the South, opposed the reopening of the slave trade while a member of the State senate, and, as a conservative Democrat, advocated many policies that were locally unpopular. When South Carolina seceded he joined the Confederate army as a private. Soon afterwards he raised a command comprising infantry, cavalry, and artillery, which was known as "Hampton's Legion." He was wounded at the first

battle of Bull Run and at Seven Pines, and in 1863 was appointed a major-general of cavalry. Twenty-one out of the twenty-three officers in his command were killed at Gettysburg, and, although wounded himself, he refused to leave the field during the battle. He commanded the Confederate forces at Trevillian Station, where he gave Sheridan a severe check, and in twenty-three days he captured over 3000 men and much material of war. He was commissioned lieutenant-general, and after the death of Gen. Jeb Stuart, became commander-in-chief of the cavalry forces of the Army of Northern Virginia. In 1876 he was elected governor of South Carolina, was re-elected in 1878, and was United States senator from 1879 to 1892. He met with an accident in 1878, while hunting, that necessitated the amputation of a leg. During the crisis through which the South passed after the Civil War, he wielded great influence and displayed statesmanlike qualities in organizing public sentiment for the acceptance and improvement of the new conditions.

HARDY, ARTHUR SHERBURNE, an American author and diplomat, was on September 26, 1902, transferred from his office as envoy extraordinary and minister plenipotentiary to Switzerland to a similar duty in Spain. He was born in Andover, Mass., August 13, 1847, and after graduating in 1869 from the United States Military Academy served for a year in the Third United States Artillery regiment. From 1871 to 1873 he taught civil engineering at Iowa College, and then spent a year in study at the Ecole des Ponts et Chaussées. On his return he became professor of civil engineering at Dartmouth College, and held that post until 1878, when he was appointed professor of mathematics. He edited the *Cosmopolitan Magazine* from 1893 to 1895; served as resident minister and consul-general for the United States at Teheran, Persia, from 1897 to 1899; was for the next two years minister to Greece, Roumania, and Serbia, and on January 11, 1901, was made envoy extraordinary and minister plenipotentiary to Switzerland. His mathematical works, *Elements of Quaternions* (1881), *New Methods in Topographical Surveying* (1884), *Elements of Analytic Geometry* (1888), and *Elements of Calculus* (1890), have found considerable favor in academic circles, but the best known of his publications are the novels, *But Yet a Woman* (1883), *The Wind of Destiny* (1886), *Passé Rose* (1889), and two poems, *Francesca of Rimini* (1878), and *Songs of Two* (1900).

HARTE, (FRANCIS) BRET, an American author, famed for his pictures of the California of '49, died at Camberley, England, May 5, 1902. He was born in Albany, N. Y., August 25, 1839; and, after a common-school training, went to California by way of Panama in 1856, and began work in the gold-fields at Sonora, seat of Tuolumne County. Having made but "grub wages" as a digger, he became a Wells-Fargo express messenger, and carried mail and gold-dust from the camp. Then for a time he was the schoolmaster of Tuttle-town, a few miles to the northward of Sonora, from which office he wandered about the State, to learn typesetting and finally to enter at San Francisco the composing-room of the weekly *Golden Era*, then the best-known paper west of the Mississippi. He wrote considerably for the *Era*, in which were begun his *Condensed Novels*, and for various other periodicals, and in 1864 became editor of *The Californian*, a literary weekly to which he contributed its first article, and on which he "brilliantly co-operated to its early extinction." It was during his editorship of this publication that there appeared in it "The Jumping Frog of Calaveras," the earliest work of Mark Twain to attract general attention. In 1864 also he was appointed secretary of the San Francisco branch of the United States mint. Upon the establishment of the *Overland Monthly* in 1868 he assumed its editorial chair. Both the *Overland* and he shortly became famous through his prose fiction, such as *The Luck of Roaring Camp*—done in a few days to supply the magazine with the distinctively Californian interest theretofore lacking, and his verse, such as *Plain Language from Truthful James* ("The Heathen Chinee"), the currency and success of which he is said greatly to have deplored. In 1871 he removed to the East, where for several years he resided, augmenting and securing his reputation by his active literary work. He was United States consul from 1878 to 1880 at Krefeld, Germany, and from 1880 to 1885 at Glasgow. He then settled in London, where he continued until his death; publishing, however, almost yearly volumes, mainly collections of short stories, and articles on American topics.

It was the fortune of Bret Harte to have reached his high level of appreciation early, and to have maintained it continuously; to have been for well-nigh half a century a decided factor in letters. By tacit consent he was official historian of the "Argonauts." His work is characterized by the union of an almost fastidious precision of workmanship with dramatic sweep, and the interfusing of pathos and humor. He had, too, the defects of his qualities. His scope was restricted: he tried the backgrounds of old England, New England, Germany, but with inferior success; and he had not—as *Gabriel Conroy* (1876) shows—the power of sustained imagination necessary to the longer forms of fiction. The *Condensed Novels* (1867; second series, 1902), parodies of well-known authors, were a *tour de force* of exceptional

cleverness in their sort. It has been said, and with much truth, that in his exaggerations and grotesqueries there is something of Dickens; but the result is obtained with an economy of expression quite unknown to the latter. In fact, it is useless to liken Harte to others. He was unique, a discoverer—not merely of the spirit of '49, not only of the American West, but of the rim of civilization. The best of Harte is to be found in his short stories and dialect poems. Of more than two-score volumes may be mentioned *The Luck of Roaring Camp* (1870), *Two Men of Sandy Bar* (1876), *Flip and Found at Blazing Star* (1882), *Snowbound at Eagle's* (1886), *A Millionaire of Rough and Ready* (1887), *Tales of Trail and Town* (1898), and *Under the Redwoods* (1901). Several incomplete collected editions of his works have been made by his authorized publishers.

HARTLEY, MARCELLUS, an American manufacturer and financier, died in New York City, January 8, 1902. He was born in New York City September 23, 1828, and at an early age entered the employ of Francis Tomes and Son, gun importers and manufacturers. In 1854 he established the firm of Schuyler, Hartley and Graham, which after the retirement of Mr. Schuyler in 1876 and the death of Mr. Graham in 1899, became the Marcellus Hartley Company. During the Civil War Mr. Hartley was commissioned a brigadier-general by Secretary of War Stanton, and was sent to Europe as a government agent to prevent supplies of arms from reaching the Confederate army, by purchasing all the guns in foreign markets. He was an active figure in New York financial circles, was president of the Bridgeport Gun Implement Company and the Remington Arms Company, and a director of many banks and other corporations. He was interested in many philanthropic enterprises and contributed largely to the support of the "Hartley House," founded by the New York Association for Improving the Condition of the Poor, and named for his father.

HARVARD UNIVERSITY, Cambridge, Mass., founded 1636. President, Charles W. Eliot. During 1902 the actions of the faculties and the public discussions and annual report of the president brought a clear decision on two most important points of university policy. These relate to the question now most under debate in university and college circles: one is the length of the college course, the other, connected with it, is the admission to graduate schools. On the first point it has been decided by faculties and overseers that a candidate must have passed in studies amounting to 16 courses together with such work in English as may be prescribed for him, making a total of 17 or 17½ courses as the case may be. He must have attained a grade above D in at least two-thirds of all the work done by him in the university. It is thus possible for a student who enters the freshman class without serious deficiency to complete the requisite number of courses in four, three and a half, or three years. Practically the same policy was recommended by the faculty in 1889, though with considerable opposition, and was not sanctioned by the overseers. Since then the number of required courses has been reduced from 18 to 16, and the student completing the required number of courses in less than four years need not attain higher grades than were required of the candidate who took four years to complete the course. The regulation that a student thus abbreviating the time spent for the A. B. degree should wait until the expiration of the full four years before receiving it has also been removed. As much work and as high attainments are demanded as in the four-years' course. President Eliot states that "Harvard University has no sympathy with any effort to lower the standards of the degree of Bachelor of Arts, or to institute for it an inferior degree. It proposes to uphold the standard of that degree by all appropriate legislation within its own walls and by the effect of its admission requirement on the secondary schools." In regard to the other question, the university has reiterated its position that the baccalaureate degree shall be required for admission into all professional schools, as is now done except in the case of dentistry. This is in radical opposition to the announced policy of most universities where the preliminary degree is not required, or where there is a distinct effort to shorten the undergraduate course. Harvard recognizes, however, that the age of graduation, especially from the professional schools, is too high, but desires to improve this situation by saving time in secondary and elementary education. The faculty has expressed its opinion that 18 should be the proper age for entrance to the freshman class. President Eliot demonstrates that the graduation age is too high and that it has serious results for society by showing that of the 881 members of the six classes from 1872 to 1877, only 72 per cent. were married, and that the 634 men had now only 1262 surviving children; and that on the assumption that half of these children were male that the future classes could not be recruited from graduates. Drawing a wider deduction, it appears that the more highly educated classes in society do not reproduce themselves. The law school has almost recovered from the slight decrease in the number of students following the change to a graduate basis. More than 99 per cent. of the 634 students are now graduates.

It is estimated that the medical school will lose one-third of its members through this change, which is now being made, though the entering class in 1902 numbered 83, as compared with 67 in 1901. The Lawrence Scientific School has raised its standards until in 1903 they will be identical with the School of Arts in requirements for admission, so far as the time and labor requisite for preparation are concerned. So far this has resulted in no diminution of numbers in the student body.

Additions to the physical equipment of the university have been for the most part to the medical school. The full amount required for the purchase of land and the erection of five new buildings was completed in March, 1902, by the gift of \$250,000 from Mrs. Collis P. Huntington, thus securing the conditional gift of \$1,000,000 from Mr. John D. Rockefeller. The total increase in the funds of the university during the scholastic year 1901-02 was almost \$1,000,000. The attendance for the year was 5206, divided as follows: College, 2109; scientific school, 584; graduate school, 316; divinity school, 37; law school, 640; medical school, 445; dental school, 112; summer session, 945. The registration for the full term 1902 had risen to 5468. The teaching staff numbers 534.

HAUSER, WALTHER, a former president of the Swiss republic, died in Berne, Switzerland, October 22, 1902. He was born in Wadenswil in 1837, and after holding several minor offices in the civil and military service was elected in 1868 to the council of his canton. In the following year he became a member of the national council of the Swiss confederation, where he served until 1875, and in 1881 was made a member of the executive council of the canton of Zurich, of which in 1883 and 1887 he was president. He acted for a time as minister of war in the federal council, and in 1892 and 1900 was president of the confederation.

HAWAII, or SANDWICH ISLANDS, a group of small islands in the Pacific Ocean, about 2100 miles west-southwest of San Francisco, Cal. The islands were acquired by the United States, mainly for their strategic importance, under a Congressional act of July 7, 1898, and were organized as the "Territory of Hawaii," by a further act of April 30, 1900. The capital is Honolulu, on the island of Oahu.

Area and Population.—The group includes 8 inhabited islands, with an approximate area of 6449 square miles; the other islands are small and unimportant. The islands are largely composed of barren mountains, and are inhabitable only on "the narrow strips of land extending from the bases of the mountains to the sea." The islands of Hawaii, Mani, Oahu, and Kauai, comprise over 90 per cent. of the territorial area, and have more than 98 per cent. of the total population. This population, as given by the completed census returns of 1900, was 154,001, as against 109,020 in 1896, and 89,990 in 1890. By race the population in 1900 was: Hawaiians, 29,799; part Hawaiians, 7,857; Caucasians, 28,819; Chinese, 25,767; Japanese, 61,111; South Sea Islanders, 415; negroes, 233.

Finance.—The principal sources of the territorial revenue are real and personal taxes, internal revenue, inheritance taxes, land rents, and land sales. Taxes upon real and personal property are limited to 1 per cent. of the assessed valuation, and there is an income tax of 2 per cent. By the Congressional act annexing Hawaii it was provided that a portion of the territorial debt, including postal savings deposits, but not to exceed \$4,000,000 in all, should be assumed by the United States. An appropriation to carry out this act was made March 3, 1901, and the following report was made by the secretary of the Treasury in his annual report for 1902: Total amount assumed, \$3,999,970.31, of which \$3,235,400 were bonds, and \$764,570.31 postal deposits. Amount paid: bonds, \$3,223,813; deposits, \$759,437.20, leaving unpaid bonds to the amount of \$11,587, and unpaid deposits amounting to \$5,133.11. Outside of the amount assumed by the United States, the Hawaiian government is responsible for a bonded indebtedness of \$939,970.31. The receipts for the fiscal year ending June 30, 1902, were \$2,473,172.81 and the expenditures \$2,262,036.48. For the year previous the receipts were \$2,140,297.36 and the expenditures \$2,925,703.53. The largest items of receipts in 1902 were: Tax bureau, \$1,658,107.09; internal revenue, licenses, and stamps, \$229,856.24; harbor master, Honolulu, \$91,650.71; public works office, \$128,687.75; and land revenue, \$103,886.69. The largest items of expenditure were: Judiciary, \$108,077.25; public works department, \$776,174.72; attorney-general, \$309,672.62; public instruction, \$376,496.26; and board of health, \$273,809.96.

The assessed valuation of property in Hawaii increased during the period 1892-1901 from \$33,234,299 to \$121,172,928, making the per capita wealth about \$2000 for every man, woman, and child. Since 1901, however, assessed valuations have undoubtedly decreased, on account of the decline in the price of sugar.

Public Lands.—There is an increased demand for small holdings and the work of the commission of public lands promises to increase steadily if funds are available. Statistics of the public land transactions for the year ending June 30, 1902, show 97 sales of 6,599.9 acres amounting to \$38,880.74 and the entrance of 33 home-

steads of 136.29 acres. The receipts of the land office during the year ending June 30, 1902, were from rents and interest \$103,886.69 and from sales \$13,036.49, making a total of \$116,923.18. A total of about 8000 acres, averaging 10 to 50 acres to a lot, were surveyed during the year, and 113 land patents were issued for 5,711.26 acres for a consideration of \$69,037.79. The indications at the end of the year 1902 promised a great increase in the number of land patents to be issued for 1903.

Agriculture and Industries.—The production of sugar is the leading industry of the islands. According to official statement the acreage devoted to cane in 1901 was 78,618 acres, yielding 359,133 tons of raw sugar, as against 66,773 acres, yielding 289,544 tons in 1900. The estimates of Willet and Gray, which always range considerably below the official figures, put the crop for the season 1901-02 at 317,509 tons, and for 1902-03 at 315,000 tons. The average yield per acre for 1901 was about 8.44 tons of sugar. The average cost of production of sugar per ton was \$41.13 and the average cost of cultivation per acre was \$265.01. The cultivation of sisal hemp was introduced into Hawaii several years ago through the agency of the Territorial Bureau of Agriculture and Forestry. A plantation of several hundred acres is located on the island of Oahu, another was started in 1902 on Molokai, and a third is about to be started on Kauai. The castor-oil bean grows wild, and of recent years has been cultivated, yielding as high as 275 gallons of oil per acre, worth in San Francisco from \$220 to \$260. The growing of pineapples increased during 1902. The one cannery of the islands put up 6200 cases.

Commerce.—Speaking broadly, the commerce of Hawaii consists of the shipment of sugar to the United States and of the importation from the United States of miscellaneous articles and manufactured products for domestic use and the development of industry. As shown by the census of 1900, sugar represents 77 per cent. of the value of all industries in Hawaii, but so far as commerce is concerned this percentage is very much greater, since other so-called "manufacturing" interests are largely "neighborhood" industries, supplying local wants. Thus of exports from Hawaii amounting to \$24,793,735 for the fiscal year ending June 30, 1902, all but \$873,622 represented exports of sugar. The total exports for the year diminished \$3,260,695.43 from 1901, owing solely, except as to \$86,885.02, to a decrease in the market value of sugar. The extent of this decrease may be seen from the fact that 690,879,234 pounds of sugar were shipped in 1901, and 720,553,357 in 1902, an increase of 29,674,123. The only other items of exports which showed a considerable falling off were coffee, amounting to \$311,897.27 in 1901, and \$126,644 in 1902, and wool, amounting to \$110,184.94 in 1901, and to only \$38,681 in 1902. Of the total exports for the year, \$54,365 was domestic (Hawaiian) merchandise shipped to foreign countries; \$24,700,557 was domestic merchandise shipped to the United States; \$9182 was foreign merchandise for foreign countries, and \$29,631 foreign merchandise for the United States. In other words, of a total of \$24,793,735, only \$38,813 was foreign merchandise, and of this same total only \$63,547 was sent elsewhere than to the United States. Imports to Hawaii from foreign countries amounted to \$3,036,583, of which \$934,585 came from British colonies, \$909,112 from Japan, \$432,498 from Germany, \$271,173 from Chile, \$259,311 from Great Britain, and \$198,657 from Hong Kong.

Railroads.—There are four railroads in Hawaii, having about 150 miles of trackage. The Oahu Railway and Land Company, the most important transportation company on the island, during the year ending June 30, 1902, carried 437,645 passengers and 388,534 tons of freight. During the period 1901-02 the company has made extensive improvements on its harbor terminal, constructing 4000 feet of wharfage equipped with two elevators of 10,000 tons capacity each, and provided with electric conveyors capable of delivering 250 tons of sugar per hour. The largest ocean steamers can load and unload at these wharves, as the water has a depth of 30 feet. The street railways of Honolulu are famed for their modern equipment and efficient service—better than in many American cities. The Honolulu Rapid Transit Company began operations August 31, 1901, with a trackage of 4.4 miles and constructed and put into operation 7.31 additional miles within a year. Since it began operations it has carried 3,255,233 passengers, earning \$156,357.40 and expending \$90,904.53, leaving a net income of \$65,452.87.

Education.—Public education in Hawaii is conducted according to the free, graded, public school system with English as the sole basis and medium of instruction. Attendance in the schools is compulsory for children between six and fifteen years of age. The schools include graded schools, night schools, industrial schools, a normal school, and a high school. The total number of students in both public and private schools in the school year 1902 was 17,518, showing an increase in the decade of 7358, or 72 per cent. Of the total number of students in 1902, 13,189 were in public schools, and 4329 in private schools. In the same year there were 143 public schools, 54 private schools, 229 private school teachers, or one to every 19 pupils, and 380 public school teachers, or one to every 35 pupils. The main difficulty

encountered in conducting the school system efficiently lies in the heterogeneity of the population. In the student enrollment of 17,518 in 1902 there were, for example, not less than nine nationalities represented in considerable number, of which the more numerous were: Hawaiians, 4903; part Hawaiians, 2869; Portuguese, 4124; Japanese, 1993; Chinese, 1395; Americans, 812; Porto Ricans, 596; and Germans, 337. Of the 609 public and private school teachers, 329 are American, 56 British, and 149 are Hawaiian or part Hawaiian. The bulk of the private schools are in Honolulu, and are either endowed, as Oahu College, or are supported by religious bodies, as St. Louis College by the Roman Catholics.

Fire Claims.—Under an act of the Hawaiian legislature in 1901, creating a commission of five persons to adjudicate all claims for property losses by fires started under direction of the board of health in 1899 and 1900, 6748 claims were examined up to June, 1902, when the commission adjourned, and \$1,473,173 was awarded to claimants out of a total of \$3,175,132.90 asked. The claims arose through an epidemic of the bubonic plague in Honolulu, and through the fact that fires, started to burn condemned buildings, got beyond control. Over \$700,000 was spent directly by Hawaii in stamping out the plague, and almost immediately thereafter the Congressional act of 1900, organizing the territory, prohibited Hawaii from borrowing money, and, at the same time, by diverting the customs duties to the federal treasury cut off 37 per cent. of the islands' current revenues. Therefore, while the territorial legislature of 1901 appropriated \$1,500,000 to pay the fire claims, it did not provide, and, under the circumstances, could not provide, any adequate means for obtaining this money. The federal government was consequently strongly urged to furnish the necessary amount and a bill to that effect was pending when Congress adjourned on July 1, 1902.

Territorial Needs.—In his report for the fiscal year ending June 30, 1902, the governor, Sanford B. Dole, reiterated the recommendations made by the acting governor, Henry E. Cooper, the year previous, to which Congress had appeared to pay but scant attention. These recommendations were that the Hawaiian silver coins, issued in 1883 to the amount of \$1,000,000, be converted into, or be exchangeable for, the corresponding United States coins; that an expert forester be detailed to the territory to organize, in conjunction with the Hawaiian government, a system of forest conservation and development; that the awards of the fire claims commission be paid by the United States, or else that the Hawaiian government be empowered to take over, and pay the awards from, the customs receipts; that the executive be authorized to grant licenses for the diversion of the water belonging to the public lands from those places where it was valueless to arid land otherwise suitable for agriculture; "that a limited immigration of Chinese laborers be permitted, conditioned upon their engaging in agricultural work for hire only during their stay in the territory and subject to deportation at their own expense upon their ceasing to do so." This last recommendation had been especially urged in 1901 by the acting governor, who pointed out that the Congressional act of 1900 organizing the territory and extending the laws of the United States to it had automatically cut off the supply of cheap contract Chinese labor upon which the sugar planters depended, and that in consequence the sugar properties had decreased in value, and would depreciate still more if an adequate supply of eastern labor was not assured. That, however, the need of Hawaii for Chinese labor would remain disregarded seemed to be clearly presaged by the Congressional act of April 29, 1902 (see UNITED STATES, paragraph Chinese Exclusion) continuing in force the exclusion laws relating to the United States and extending to "all territory under its jurisdiction." Other recommendations of the governor were that the federal instead of the territorial government should be charged with the care and improvement of Hawaiian harbors; that the payment of taxes for the preceding years be made a prerequisite to voting for a territorial delegate to Congress, or for territorial senators and representatives; and that the governor be permitted to remove until the next succeeding session of the senate, officers for whose removal the consent of the senate was necessary.

Political.—In January, 1902, President Roosevelt removed Governor Sanford B. Dole from office because of certain charges of collusion with crime and blackmail preferred by Judge Humphreys of the territorial court. Dole was called to Washington, D. C., to answer the charges, and after a thorough investigation President Roosevelt decided that the charges were not sustained and reappointed him as governor of Hawaii, thus vindicating his character and ability as administrator of the territorial government. Henry E. Cooper, Hawaiian secretary of state, was also reappointed to that office.

Elections.—At the regular election for 1902, Jonah Kalauiauoale, Republican, was chosen delegate to Congress by a vote of 6500 to 4700 for Robert W. Wilcox, the Democratic candidate. In the territorial legislature the Republicans will have 30 majority.

Territorial Officers.—Governor, Sanford B. Dole; secretary of territory, H. E. Cooper; treasurer and auditor (acting), H. E. Cooper; attorney-general (acting), S. B. Dole. Supreme Court, chief justice, W. F. Frear.

HAY. This crop, next in value to the corn crop, was a very fair one in 1902, the average yield per acre (1.5 tons) being the highest ever reported by the United States Department of Agriculture with the exception of 1898. The quality, however, was not up to the average, much of the crop being injured by rain in the making. The yields for States having a million or more acres were as follows:

	Acreage, Acres.	Production, Tons.	Value.
Maine	1,278,824	1,367,807	\$13,732,782
New York	5,013,987	6,718,743	70,748,364
Pennsylvania	3,103,363	3,693,002	51,702,028
Ohio	2,768,547	3,959,022	40,382,024
Michigan	2,193,567	3,180,672	26,399,578
Indiana	1,804,942	2,635,215	22,847,314
Illinois	2,747,869	4,121,054	36,553,749
Wisconsin	1,720,318	3,268,604	25,854,658
Iowa	3,101,924	5,211,232	38,873,008
Missouri	2,698,654	4,290,860	29,564,025
Kansas	1,888,937	3,211,193	13,840,242
Total for United States	39,825,227	59,857,576	542,036,364

The total yield for 1901 was reported as 50,590,877 tons, and had a value of \$506,191,533. This was based upon an estimated acreage of a half million acres less than the returns for 1902. In comparing the returns for the two years, the readjustment of the acreage on the basis of the census returns should be borne in mind. The crop of grass and clover hay in Ontario in 1902 was 4,955,438 tons, and in the United Kingdom 11,277,652 tons, the latter being much above the production in 1901.

The exports of hay from the United States in 1902, as compared by F. H. Hitchcock, chief of the Division of Foreign Markets of the Department of Agriculture, were as follows:

COUNTRIES TO WHICH EXPORTED.	Tons.	Dollars.	COUNTRIES TO WHICH EXPORTED.	Tons.	Dollars.
United Kingdom ..	51,552	794,918	Mexico	10,898	149,341
British South Africa....	37,532	705,143	Other countries.....	6,008	99,709
Philippine Islands . . .	19,134	358,816			
Canada.....	28,807	472,695	Total.....	153,431	2,580,622

The imports of hay in 1902 were 48,415 tons, valued at \$381,417, almost exclusively from Canada.

The hay crop of the United States includes quite a large proportion of clover and other leguminous plants, the growth and variety of which is steadily spreading to all parts of the country. With the increasing difficulty of securing a stand of clover, substitutes for it, notably alfalfa, are being introduced. It has been demonstrated that alfalfa, formerly confined to the West, can be successfully grown in most of the Northern States, as well as in the Central States and the South. There has been a large amount of experimental work with animals to test the value of alfalfa and its most advantageous use in the ration. This has uniformly shown its high feeding value and pointed a way to the saving of heavy feed bills, the alfalfa hay taking the place of a part of the grain in the ration. For example, the New Jersey experiment station found that when alfalfa hay was fed to cows in place of a ration of 11 pounds of grain the milk production kept up well and the cost was much reduced, the cost per 100 pounds of milk being 83.9 cents on the grain ration and only 55.9 cents on the alfalfa. Good results were likewise obtained with other leguminous hays, such as crimson clover and cow peas. The Missouri experiment station found in feeding experiments with steers that the addition of clover hay or cow pea hay to the ration induced better and cheaper gains, and the steers fed these hays carried to market more finish, a better coat, and a finer "bloom," and would readily have outsold those which did not receive these feeds. Alfalfa hay has also given excellent results with horses and sheep, and the green alfalfa makes fine pasturage for hogs.

HAYTI. See **HAITI**.

HECTOR, ANNIE ALEXANDER, an Irish author, better known by her pseudonym of "Mrs. Alexander," died in London, July 10, 1902. Born in Dublin, Ireland, in 1825, she was educated in Dublin and France, and at an early age began to write both fiction and verse. She gave up her writing after her marriage in 1858, but

at her husband's death a few years later she returned to her pen as a means of support and published several poems and a long series of novels. Beginning with *Which Shall It Be?* (1866), and *The Wooing O't* (1873), her works achieved a large measure of popular success both in England and in the United States, but had slight claim to literary recognition and in more recent volumes failed even to justify a certain degree of earlier promise. Among the other writings with which her name is most frequently identified are *Her Dearest Foe* (1876); *The Heritage of Langdale* (1877); *Maid, Wife or Widow* (1879); *The Freres* (1882); *The Admiral's Ward* (1883); *A Second Life* (1885); *By Woman's Wit* (1886); *A Winning Hazard* (1896); *Barbara: Lady's Maid and Peeress* (1897).

HELMUTH, WILLIAM TOD, an American physician, died in New York City, May 15, 1902. He was born in Philadelphia, Pa., October 30, 1833, and after study at St. Timothy's College, Baltimore, he entered the Homœopathic Medical College in Philadelphia, from which he graduated in 1853 and where in 1855 he became professor of anatomy. Removing to St. Louis, Mo., in 1858, he engaged in active practice and aided in the establishment of the St. Louis College of Homœopathic Physicians and Surgeons, of which he was made dean and professor of surgery. In 1869 he was called to the chair of surgery in the New York Homœopathic Medical College and Hospital, where his subsequent achievements as lecturer and surgeon made him one of the most widely known exponents of homœopathic surgery in the United States. For the last ten years he acted as dean of the college. He was an honorary member of the Société Médicale Homœopathique of France, had been president of the American Institute of Homœopathy and the New York State Homœopathic Medical Society, and was a consulting surgeon at many New York hospitals. The most important of his medical works are *Surgery and its Adaptation to Homœopathic Practice*; *Treatise on Diphtheria*; *System of Surgery*; *Suprapubic Lithotomy*; *Nerve-Stretching*; and *Antiseptic Surgery*. He was also the author of several witty poems and stories, published as *Medical Pomposity*; *Scratches of a Surgeon*; and *With the Pousse Café*. From 1875 he was an associate editor of the *North American Journal of Homœopathy*.

HEMPHILL, WILLIAM, an American publisher and founder of the *Atlanta Constitution*, died August 17, 1902, at Atlanta, Ga. He was born May 5, 1842, in Athens, Ga., was educated in the public schools of that city, and at the University of Georgia, from which he graduated with a special degree in engineering. During the Civil War he served in the Confederate army and was wounded at Gettysburg. After the war he went into the publishing business. He was elected mayor of Atlanta in 1891.

HENDERSON, DAVID BREMNER, speaker of the United States House of Representatives in the Fifty-sixth and Fifty-seventh Congresses (1899-1903) announced his retirement from congressional life in September, 1902, and was not a candidate for re-election to the Fifty-eighth Congress in November. He was born at Old Deer, Scotland, March 14, 1840, came to America with his parents in 1846, settling first in Illinois, and removed to Iowa in 1849. He was educated in the public schools and at Upper Iowa University and had begun reading law when his professional studies were interrupted by the outbreak of the Civil War. He at once enlisted as a private in the Twelfth regiment of Iowa volunteer infantry and was commissioned lieutenant before the regiment left the State. He served with bravery and distinction, was wounded in the assault on Fort Donelson and lost a leg at the battle of Corinth, because of which he was honorably discharged in February, 1863. In June, 1864, he obtained another commission, this time as colonel of the Forty-sixth regiment of Iowa volunteer infantry in recruiting which he had displayed great energy, and remained in the field until the conclusion of hostilities. From 1865 to 1869 he was a United States collector of internal revenue in Iowa, and assistant United States district-attorney from 1869 to 1871. He was engaged in the practice of law at Dubuque 1871-82, and in the latter year was elected as a Republican to the Forty-eighth Congress. His service in the house, in which he sat continuously from 1882 to 1902, has been a notable one, and he has been considered the type of unflinching, uncompromising Republicanism. A ready debater, a good parliamentarian, and a conscientious committee worker, he has been for more than a decade one of the recognized leaders of his party in the house. He was one of the leading candidates for the speakership in the Congressional caucus in the Fifty-first Congress which nominated Thomas B. Reed, for ten years was a member of the committee on appropriations, and in the Fifty-fourth and Fifty-fifth Congresses was chairman of the judiciary committee and a member of the committee on rules. Upon the retirement of Thomas B. Reed from Congress in 1899 he became his successor as speaker. Disagreement with his party in Iowa, which had declared for tariff reform, is said to have caused Speaker Henderson to determine upon retirement.

HENRY, ALBERT WILLIAM, Prince of Prussia and brother of the German Emperor William II., was born at Potsdam, August 14, 1862, the second son of Emperor Frederick III. After study from 1875 to 1877 at the Cassel gymnasium he entered the German navy and in 1878, on the *Prinz Adalbert* under Captain Seckendorff, started on his first voyage. In 1880 he returned after having visited China and Japan, and studied at the naval academy of Kiel until 1882, when he began another voyage of two years, on board the *Olga*. He commanded a company of the first naval battalion at Kiel in the winter of 1886-87 after additional training at the academy and service as first officer of the *Oldenburg*, served as chief of a torpedo boat division in the summer of 1887, held the command of the yacht *Hohenzollern* in the following year and of the first battalion at Kiel from October, 1890, to February, 1892, and in 1895 was made rear admiral. While commanding a squadron sent out by Germany during the eastern disturbances of 1898 he had considerable cruising experience in Corean and Siberian waters, visited the Emperor of China, and after acting as chief of the entire eastern squadron in 1899, became vice-admiral in December of that year. He was made admiral in September, 1901. On January 1, 1902, the German Emperor requested of President Roosevelt that the President's daughter christen the imperial yacht then building in the United States. The request was granted, and on February 23 Prince Henry arrived at New York as the Emperor's representative at the launching, accompanied by a number of distinguished army and navy officers. Rear Admiral Robley D. Evans of the United States navy was detailed to act as aide-de-camp in the Prince's suite, at the Emperor's special request. After an official welcome by the mayor of New York Prince Henry immediately left for Washington, where on the following day he visited both houses of Congress and was given a state dinner at the White House. He returned to New York on Thursday, February 25, to a most successful launching and a special performance of the opera of great social brilliance; and after a dinner given by American "Captains of Industry" and a banquet by newspaper editors on Wednesday, he again visited Washington and heard Secretary of State Hay's memorial oration on President McKinley. On Friday, February 26, he crossed the Alleghenies in the cab of a locomotive, made short stops at Pittsburg, Columbus, and Cincinnati, visited the battle-grounds of Chattanooga and Lookout Mountain, and on Monday, March 3, reached St. Louis and Chicago. His rapid tour further included Milwaukee, Buffalo, Albany, West Point, and Boston, and at Cambridge on March 6 he received the honorary degree of LL.D. from Harvard University. Once more in New York he was given a dinner by the German Society of the metropolis, was entertained at several private dinners, and after a short expedition to Philadelphia he sailed March 11 on the *Deutschland*. His visit to America was at first construed by many European newspapers as an event of profound international significance. But in the United States his presence was regarded as of no political import, and he was entertained only as a guest of more than usual distinction.

HENTY, GEORGE ALFRED, an English author, died in Weymouth, England, November 16, 1902. He was born in Trumpington, near Cambridge, December 8, 1832, and was educated at the Westminster School and at Caius College, Cambridge. A short service in the Crimea in the purveyor's department was followed by a promotion to the post of purveyor of the forces, and a charge over the hospitals of the Italian legion. At the end of the war he commanded for a time the Belfast and Portsmouth districts, and then for several years engaged in mining in Wales and Italy. In 1866 he became a special correspondent of the *London Standard*, and in the service of his paper followed the contestants of the Austro-Italian, Franco-German, and Turco-Servian wars, was with Garibaldi in the Tyrol and Lord Wolseley in Africa, made an extended inspection of mining regions in western America, and accompanied the Prince of Wales on his journey through India. His first stories appeared in the *Union Jack*, a boys' magazine which he began to edit after returning from his varied travels, and their instantaneous success led him to devote himself entirely to novel writing. His long service as war correspondent gave him material which seemed inexhaustible, and until his death he was the most prolific and the most popular of contemporary writers of boys' books. The best known of his more serious fiction are *All but Lost* (1869); *Gabriel Allen* (1888); *Dorothy's Double* and *Colonel Thorndyke's Secret* (1898). His most recent writings for boys are *In the Irish Brigade* (1900); *Out with Garibaldi* (1900); *With Buller in Natal* (1900); *At the Point of the Bayonet* (1901); *Malcolm the Water Boy* (1901); *To Herat and Cabul* (1901); *With Roberts to Pretoria* (1901); *The Treasure of the Incas* (1902); *With the British Legion* (1902); *With Kitchener in the Soudan* (1902).

HEPWORTH, GEORGE HUGHES, American clergyman and author, died in New York City, June 8, 1902. He was born in Boston, Mass., February 4, 1833, and was educated first at the Boston Latin School and then at the Harvard Divinity School, graduating from the latter in 1855. After a pastorate of two years on Nantucket

Island he continued his studies at Harvard, and in 1858 became pastor of the Church of the Unity, in South Boston, where he displayed strong individuality in radical church work. In 1862-63 he served in the Civil War as regimental chaplain and held the same post on the staff of Gen. N. P. Banks during the Louisiana campaign. He went to New York City in 1870 and for two years was pastor of the Unitarian Church of the Messiah. Adopting then the belief in the Trinity, he served as pastor of the Church of the Disciples until 1879, and from 1882 to 1885 had a charge in Newark, N. J. In 1880, the year of the Irish famine, he headed a commission sent to Ireland to distribute among the destitute peasantry a relief fund collected by the New York *Herald*, and after his return became connected editorially with that paper and contributed to it his well known Sunday sermons. He visited Armenia in 1897 to investigate the reported Turkish persecution of Christians, and two years later went to Utah to study the political and social effects of Mormonism. Among his best known writings are *Whip, Hoe, and Sword* (1864); *Rocks and Shoals* (1870); *Hiram Golf's Religion* (1892); *Brown Studies* (1895); *The Farmer and the Lord* (1896); *Through Armenia on Horseback* (1898).

HERBERT, Sir MICHAEL HENRY, British ambassador to the United States, was appointed during the summer of 1902, in succession to the late Lord Pauncefoot. The questions pending between the United States and Great Britain are of such moment that only a man of proved ability could fill that position; and the career of Ambassador Herbert, though not remarkable for brilliant successes, has been one of steady and rapid advancement, in which he has won the reputation of being a discreet and farsighted diplomat. Besides, he had already been attached to the British legation at Washington, and by residence and family affiliations was known to many prominent Americans. Upon him largely devolves the opportunity of maintaining during his term of office the increased friendly relations between the United States and Great Britain. He was born in 1857, and after completing his education, was appointed an attaché of the British legation in Paris, being made second secretary in 1883. In 1888 he was transferred to Washington, where he was chargé d'affaires for four months, and promoted to be secretary of legation in 1892. During 1893-94 he was secretary of legation at The Hague, and was then transferred to Constantinople, where he did valuable service as chargé d'affaires during the temporary absence of Sir Philip Currie. In 1897 he was secretary of the embassy at Rome and in the following year went to Paris, where his rank was raised to that of minister plenipotentiary. There he remained until transferred to his present post.

HERRON, FRANCIS JAY, a major-general in the Union Army during the Civil War, died January 8, 1902, in New York City. He was born February 17, 1837, at Pittsburgh, Pa., and graduated at the Western University of Pennsylvania in 1853. At the outbreak of the Civil War he raised a company and joined the First Iowa volunteers. He was engaged in the battles of Dug Springs, Ozark, and Wilson's Creek, and was promoted lieutenant-colonel in September, 1861. He commanded the Ninth Iowa volunteers in the campaigns in Missouri, Arkansas, and Indian Territory, and was wounded and taken prisoner at Pea Ridge, a battle in which his gallantry was singled out by Congress for the award of a medal in 1893. He was exchanged, and promoted brigadier-general of volunteers in July, 1862, commanded the Army of the Frontier in the battles of Prairie Grove and Van Buren, and was promoted major-general. In 1863 he joined Grant at Vicksburg. He received the surrender of the trans-Mississippi army of 60,000 men, together with all of the Confederate military stores in the Western States. Soon after the war he resigned his commission as major-general, and went into business in New York City.

HERZEGOVINA. See BOSNIA AND HERZEGOVINA.

HILPRECHT, HERMANN VOLRATH, a German-American Assyriologist, whose recent explorations have aroused wide interest, was born at Hohenerxleben, Germany, in 1859, obtained his education at Bernburg and Leipzig, and after tutoring in theology for a year at Erlangen removed to Philadelphia in 1886 to edit the Oriental department of the *Sunday School Times*, at the same time being appointed professor of Assyriology in the University of Pennsylvania. In 1888 he was one of the two Assyriologists who represented the scientific work of the expedition sent out by the University of Pennsylvania to excavate the ancient city of Nippur, the ruins of which have yielded over 75,000 inscribed objects. During the summers of 1894-95 he explored the region of Cappadocia in order to determine the character of the antiquities discovered in that country. He was the scientific director of the recent excavations at Nippur, when the famous temple library was discovered which yielded 20,000 tablets belonging to the third millennium B.C., and many other important antiquities. In 1902 his professorship at the university was endowed by Messrs. Edward W. and Clarence H. Clark with \$100,000, and in the same year he received the Lucy Wharton Drexel medal in recognition of his contributions to

archæology and philology. Since 1893 he has been a curator of the Imperial Ottoman Museum in Constantinople. His chief works are: *Freibrief Nebuchadnezzar I.* (1883); *Old Babylonian Inscriptions, chiefly from Nippur*, cuneiform texts (part i. 1892; part ii. 1894); *Assyriaca* (1894); *Business Documents of Murashû Sons of Nippur, dated in the reign of Artaxerxes I.*, cuneiform texts (1898); *Explorations in Bible Lands during the Nineteenth Century* (1903); *Business Documents of Murashû Sons of Nippur, dated in the reign of Darius II.*, cuneiform texts (1903); and *Dated Tablets from the Cassite Archives of Nippur*, cuneiform texts (1903).

HINES, HARVEY KIMBALL, American Methodist clergyman, died in Portland, Ore., January 19, 1902. He was born in Herkimer County, N. Y., in 1828, was licensed to preach in 1847, and in 1853 became a member of the Oregon conference. From then until his death he was most actively engaged in religious work, and in the performance of his duties as pastor, public speaker, and presiding elder of the State of Washington and of nearly all of Oregon and Idaho, he became the most widely known minister in the northwest. Prominent in politics as well as in ecclesiastical matters, he was a member of the territorial legislature of Washington in 1864 and 1866, was at one time president of the territorial council, ran for Congress, though unsuccessfully, as a Republican candidate from Oregon, and in 1876 served as a delegate to the National Republican convention. He was for eight years editor of the *Pacific Christian Advocate*, and was the author of *Missionary History of Oregon*.

HIRSCH, JENNY, a German author, died in Berlin, March 10, 1902. She was born in Zerbst, November 25, 1829, and after several years of teaching was, from 1860 to 1864, a member of the staff of the Berlin *Basar*, for which she wrote under the pen name of "J. W. Heynrichs." The movement for broadening the field of vocations open to women and for increasing their educational privileges early enlisted her sympathies, and for many years she was the secretary of the Lette-Verein. She edited *Der Frauenanwalt* from 1870 to 1882, the *Deutschen Hausfrauenzeitung* from 1887 to 1892 (with Lina Morgenstern), translated Mill's *Subjection of Women* under the title *Hörigkeit der Frau* (3d ed. 1891), and under the pseudonym of "J. Arnefeldt" wrote *Befreit* (1882); *Der Väter Schuld* (1882); *Schwere Ketten* (3d ed. 1884); *Die Erben* (1889); *Schlangenlist* (1891); *Vermisst* (1894); *Lowenfelde* (1896); *Schuldig* (1899); *Camilla Feinberg* (1901). Among works published over her own name are *Geschichte der 25 jährigen Wirksamkeit des Lette-Vereins* (1891), and the romances *Der Amerikaner* (1894); *Theresens Glück* (1899); *Auf Umwegen* (1900).

HIRTH, FRIEDRICH, a German-American Chinese scholar, was appointed to the chair of Chinese, in 1902, at Columbia University, the first to be established in the United States. He was born in Gräfen-tonna, Germany, in 1845, studied at Leipzig, Berlin, and Greifswald, and lived for twenty-seven years in China, where he was in the customs service under Sir Robert Hart. Professor Hirth is regarded as one of the leading authorities in the Christian world on Chinese language, literature, and customs. His valuable collection of ancient porcelains is in the Gotha Museum, and a collection of Chinese manuscripts and printed books is in the Royal Library at Berlin. He applied the methods of classical philology to his investigations in Chinese, and has been able to trace in contemporary Chinese authors many things long lost in obscurity, such as the invention of porcelain and the trade routes by which the famous celadon variety was brought to western countries by Arab traders of the Middle Ages. Some of his publications are: *China and the Roman Orient* (1885); *Ancient Porcelain* (1888); *Text-Book of Documentary Chinese* (2 vols., 1885-88); *Chinesische Studien* (vol. 1. 1890); *Ueber fremde Einflüsse in der chinesischen Kunst* (1896). The courses offered by the Chinese department at Columbia fall in three groups, treating of the written language, the spoken language, and history and general knowledge of China.

HISTORICAL ASSOCIATION, AMERICAN, founded in 1884, and incorporated by act of Congress in 1889, for the promotion of historical studies. An annual meeting is held during the closing week of the year at some city in the East, or in the West, or in the District of Columbia, in triennial succession. The work of the association is carried on chiefly through committees, the following being the standing committees, with their respective chairmen, for 1902: Historical manuscripts commission, Professor Edward G. Bourne; committee on Justin Winsor prize, Prof. C. M. Andrews; committee on bibliography, E. C. Richardson; public archives commission, Professor William MacDonald; committee on publications, Professor George L. Burr; board of editors of *American Historical Review*, Professor William M. Sloane; general committee, Charles H. Haskins, Ph. D. At the annual meeting for 1902, held December 26-31, in Philadelphia, in conjunction with the American Economic Association, the following papers were read: "Subordination in Historical Treatment," Alfred Thayer Mahan, LL. D., president of the

American Historical Association; "Economics and Social Progress," by Edwin R. A. Seligman, president American Economic Association; "The American of 1775," James Schouler; "Antecedents of the Declaration of Independence," James Sullivan, New York High School of Commerce; "Letters from Federal Convention of 1787," Professor J. Franklin Jameson, Chicago University; "A Neglected Point of View in American Colonial History," Professor William MacDonald, Brown University; "Diplomacy and the Withdrawal of the French from Mexico," Prof. C. A. Duniway, Leland Stanford Jr. University; "The French Parliaments," Hon. James Breck Perkins; "The Art of Weaving—A Hand-Maid of Civilization," William B. Weeden; "The Attractiveness of History," Professor Charles W. Colby, McGill University; "The French Communes in the Light of their Charters," Professor Earl W. Dow, Michigan University; "Municipal Problems in Mediaeval Switzerland," Professor John M. Vincent, Johns Hopkins University; "Some Bibliographical Notes on Italian Communal History," Arthur M. Wolfson, De Witt Clinton High School, New York; "American Constitutional Principles in the Constituent Assembly," Professor Henry E. Bourne, Western Reserve University; "The West and Nationality," Professor John L. Stewart, Lehigh University; "Party Politics in Indiana During the Civil War," Professor James A. Woodburn, Indiana University; "Currency Problems in the Orient," Prof. J. W. Jenks, Cornell University; "American Business Corporations Before 1789," Judge Simeon E. Baldwin, Supreme Court of Errors, Connecticut; "The Scots Darien Settlement," Hiram Bingham; "A Letter of Humboldt Touching the Isthmian Canal," George G. Wilson; "The National Canal Policy," L. M. Keasbey; "The Neutralization Features of the Hay-Pauncefote Treaty," John H. Latane; "Central America and the American Foreign Policy," J. W. Callahan; "England and the Suez Canal," Theodore S. Woolsey. The Justin Winsor prize of \$100 for 1902 was awarded to Dr. Charles McCarthy, Madison, Wis., for his monograph on the "Anti-Masonic Party." Membership at the close of 1902 was 1850. President, Henry Charles Lea, LL. D.; secretary, A. Howard Clark, Smithsonian Institution, Washington, D. C.

HITCHCOCK, HENRY, an American lawyer, died in St. Louis, Mo., March 18, 1902. He was born in Spring Hill, Ala., July 3, 1829, graduated at the University of Tennessee in 1846, and in 1848 from Yale, which granted him the degree of LL. D. in 1875. He was for a time an instructor in the Worcester (Mass.) High School, studied law in the office of Judge William F. Copper in Nashville, and in 1851 was admitted to the St. Louis bar. After acting as assistant editor of the *St. Louis Intelligencer* (Whig), from 1851-52, he began active practice and soon became prominent in politics. During the Civil War he served as assistant adjutant-general of volunteers, was on General Sherman's staff as judge-advocate during the march to the sea, received in March, 1865, the brevet of lieutenant-colonel of volunteers for services during the campaigns in Georgia and the Carolinas and in April of the same year bore the despatches to Washington which announced the truce between Sherman and Johnston. He was one of the organizers of the St. Louis Law School, of which he was dean from 1867 to 1880, and was one of the founders of the American Bar Association, of which he was president from 1889 to 1890. He was elected vice-president of Washington University in 1886, was a trustee of the Carnegie Institution, and was connected as an organizer or official with the Missouri State Bar Association, the Missouri Civil Service Reform Association, and the National Civil Service Reform League. President Harrison named him for the United States Supreme Court bench, but he was unwilling to relinquish his large legal practice. It is said that from his character and career was drawn "Stephen Brice" in Winston Churchill's historical novel *The Crisis*.

HOADLEY, GEORGE, ex-governor of Ohio, died August 26, 1902, at Watkins, N. Y. He was born July 31, 1826, at New Haven, Conn. In 1830 his family removed to Cleveland, O., and he graduated at Adelbert College (now part of Western Reserve University) in 1844, studied law at Harvard, and was admitted to the bar in 1847. Two years later he became a partner of Salmon P. Chase. In 1851 he was appointed a justice of the superior court of Ohio and served for two years. He was originally a Democrat, and although he left that party on account of his aversion to slavery, he returned to it in 1871 in opposition to the protective tariff. In 1873 he was a member of the State constitutional convention, and in 1883 was elected governor. He was a professor in the Cincinnati Law School from 1864 until he removed, in 1887, to New York City, where he continued to practise law.

HOBART, HARRISON CARROLL, an American soldier and politician, died in Milwaukee, Wis., January 26, 1902. He was born in Ashburnham, Mass., January 31, 1815, and in 1843 graduated at Dartmouth College. In 1846 he began the practice of law in Wisconsin, was the representative from Sheboygan and Washington counties in the territorial legislature that met in 1847, and was the first State senator from his district. He was the last survivor of the Wisconsin Constitutional Convention,

and was actively interested in the politics of Wisconsin during its early statehood. In 1849 he was the speaker of the lower house. During the Civil War he served as captain of the Fourth Wisconsin Infantry, and as lieutenant-colonel and colonel of the Twenty-first Wisconsin Infantry; and was one of the five Union prisoners who escaped from Libby prison through the famous Ross tunnel. In 1865 he was brevetted a brigadier-general of volunteers.

HOFFMAN, EUGENE AUGUSTUS, an American clergyman, educator, and philanthropist, died at Rouse's Point, Clinton County, N. Y., on June 17, 1902. Born in New York City March 31, 1829, he graduated at Rutgers College in 1847, at Harvard in 1848, at the General Theological Seminary in 1851, was ordained priest of the Protestant Episcopal Church, and from 1851 to 1853 was in charge of Grace Church, Elizabethport, N. J. Subsequently he was rector of Christ Church, Elizabeth, N. J. (1853-63), of St. Mary's, Burlington, N. J. (1863-64), of Grace Church, Brooklyn, N. Y. (1864-69), and of St. Mark's, Philadelphia, Pa. (1869-79). In 1879 he succeeded to the office of dean of the General Theological Seminary. He found the institution in an extremely unsatisfactory condition, but by his skill as an organizer and financier and his notably munificent gifts made it the foremost seminary of the church in the United States, with a splendid equipment after the model of the historic English universities. His administration was characterized by Dr. Morgan A. Dix as "without a parallel, so far, as I believe, in our ecclesiastical annals." To the library of the seminary he gave a copy of the Gutenberg Bible, and for it he completed the collection of Latin bibles, the finest and most valuable in existence, surpassing those of the British Museum and the Bibliothèque Nationale. He also presented to the Museum of Natural History of New York City gifts of rare specimens, collected in America, Asia, and Africa, and at St. Luke's Hospital endowed a private room for the use of the clergy of the church. He was deputy from the diocese of New York to five successive general conventions, was one of the board of managers of the Domestic and Foreign Missionary Society, a fellow of the American Museum of Natural History, and president of the New York Historical Society. His publications include *Free Churches* (1856), and *The Eucharistic Week* (1859). Among the degrees conferred upon him was that of D.D. by the University of Oxford.

HOFMANN, HEINRICH (KARL JOHANN), a German composer, died in Berlin, July 19, 1902. He was born in Berlin, January 13, 1842, and studied music there in Kullak's conservatory. He attained considerable repute as a pianist and teacher, but the flattering reception accorded his *Hungarian Suite* (1873) and *Frithjof Symphony* (1874) led him to abandon his other musical activities for composition. Many operas, oratorios, choral works, songs, orchestral pieces and pianoforte compositions are numbered among his writings. Chief among his operatic productions are *Cartouche* and *Armin* (1872); *Annen von Tharau* (1878); *Donna Diana* (1886). Of his choral works *Die schöne Melusine* (op. 30); *Aschenbrödel* (op. 45), and *Editha* (op. 100) are well known in America. His pianoforte compositions, besides the familiar duets *Italianische Liebesnovelle*, include *Liebesfrühling*, *Silhouetten aus Ungarn*, *Steppenbilder*, *Suite Hongroise*, and many others. He was a member of the Royal Academy of Arts in Berlin.

HOLLAND. See NETHERLANDS.

HOLMES, OLIVER WENDELL, chief-justice of the Supreme Court of Massachusetts since 1899, was appointed on August 11, 1902, by President Roosevelt a justice of the Supreme Court of the United States, to succeed Justice Horace Gray (*q.v.*), who retired on that day. He is the son of Dr. Oliver Wendell Holmes, and was born in Boston, Mass., March 8, 1841. He graduated at Harvard in 1861, and immediately entered the Union Army as a lieutenant in a Massachusetts volunteer regiment. He served with distinction until 1864, was wounded at Ball's Bluff, Antietam, and Fredericksburg, and was successively brevetted major, lieutenant-colonel, and colonel for gallant and meritorious service. After leaving the army he entered the Harvard Law School, where he graduated in 1866. Beginning practice in Boston his rise at the bar was rapid. He was editor of the *American Law Review* from 1870 to 1873. In the latter year he entered the law firm of Shattuck, Holmes and Monroe, with which he was associated until his elevation to the bench in 1882, as an associate justice of the State Supreme Court, of which he became chief justice in 1899. In 1882 he was also in the faculty of the Harvard Law School. A series of lectures on *The History of the Common Law*, delivered at the Lowell Institute in Boston, and published in 1881, won him fame as a legal writer. The book remains to-day one of the best authorities upon the subject, and is as highly thought of in England as in America. Another enduring work is his edition—the twelfth—of Kent's *Commentaries*. In addition to his extensive legal learning and judicial experience, he is a man of great energy and ability as an orator.

HOLUB, EMIL, an Austrian traveler and explorer, died in Vienna, February 21, 1902. He was born in Holitz, Bohemia, October 7, 1847, and after studying medicine

and natural history for a time at the University of Prague, he went to South Africa, where he began to practise as a physician. His interest in natural history led him to make several journeys through the region of the Zambesi, and in 1879 he returned to Europe with a valuable collection of zoological and ethnological specimens. He continued his scientific and mathematical studies, took his degree as doctor of medicine, and aided by public and imperial contributions, in 1883 renewed his travels through central Africa. Starting from Kapstadt he reached Schoschong in Bechuanaland in 1887 after many hardships, and returned soon after to Vienna with another large collection, which after public exhibition was distributed among various institutions of learning. The Emperor Francis Joseph conferred upon him the Order of the Iron Crown. He gave many lectures on South African affairs, which were of especial interest during the Boer War, and published *Kulturskizze des Marutse-Mabunda-Reichs* (1879); *The Victoria Falls* (1879); *Sieben Jahre in Südafrika* (1880-81); *Die Kolonisation Afrikas* (1882); *Beiträge zur Ornithologie Südafrikas* (1882); *Von Kapstadt ins Land der Maschukulumbe* (1888-90).

HONDURAS, a Central American republic, borders on the Caribbean Sea and touches the Pacific at the Gulf of Conchagua. The capital is Tegucigalpa.

Area and Population.—The estimated area is about 43,000 square miles. In 1901 the boundary line between Honduras and Nicaragua was established from the Pacific coast to Portillo de Teotecacinte, but from that point to the Atlantic the boundary remains in dispute. In 1902 the congress enacted a law, to take effect on the 15th of September, creating a new department (state), Atlantida, which extends on the Caribbean Sea from Tela on the west to Belfata on the east, and reaches inland about 50 miles. The capital of the new department is La Ceiba. According to a census taken in 1901, the results of which became available in 1902, the population of Honduras, exclusive of uncivilized Indians, was 543,741. Most of the inhabitants are of Indian blood. Roman Catholicism is the prevailing religion, but there is no state church. Primary instruction is free, secular, and nominally compulsory. At the beginning of 1902 there were 784 public schools, with 28,026 pupils in attendance. A number of schools are provided by the government for more advanced education.

Government.—The executive authority is vested in a president, who is elected by popular vote and is assisted by a cabinet representing five departments. The legislative power rests with a congress of deputies. The president in 1902, for the four-year term ending January 31, 1903, was Gen. Terencio Sierra. The regular army numbers only about 500 men; the militia numbers upwards of 40,000.

Finance.—The monetary standard is silver, and the unit of value the peso, worth 42.8 cents on October 1, 1901, and 38.4 cents on October 1, 1902. The most important source of revenue is customs, and the largest item of expenditure is for the department of war. The reported revenue and expenditure for fiscal years were 2,842,005 pesos and 2,629,815 pesos respectively in 1900, and 3,017,273 pesos and 2,840,397 pesos respectively in 1901. The estimates for the fiscal year 1903 balanced at 2,629,050 pesos. The external debt with arrears of interest, unpaid since 1872, amounted in July, 1901, to £18,761,622 (\$91,303,433). The internal debt in 1901 was 1,285,208 pesos.

Production and Commerce.—The leading crops are tobacco, sugar, corn, coffee, and bananas, the last named being the most important. Considerable attention is given to cattle raising. The mineral resources of Honduras are remarkable in richness and extent, and although they are little developed on account of poor transportation and the usual risks attending investments in Latin-American countries, metals (including ores) occupy first place among the exports. According to an official report the New York and Honduras Rosario Mining Company, at San Juancito, has an annual output of gold and silver bullion valued at about \$1,000,000. The leading imports include cotton textiles and iron and steel goods. The reported values in pesos (silver) of imports and exports in the fiscal year 1897 were 1,131,315 and 2,647,248 respectively; in 1900, 2,416,625 and 5,930,104 respectively; and in 1901, 4,168,599 and 6,183,023. Of the latter imports 3,344,575 pesos were dutiable. The principal items of export in 1901 were metals (precious), 2,279,115 pesos; fruits (chiefly bananas), 1,945,388 pesos; live stock, 557,316 pesos; coffee, 275,194 pesos; cabinet woods, 274,255 pesos. The values of imports in pesos from countries of greatest trade importance in 1901 were: United States, 2,792,822; Germany, 486,274; Great Britain, 471,691; British Honduras, 152,800; France, 101,856. Of the exports about 70 per cent. were shipped to the United States and a large part of the remainder to Germany. A railway is in operation from Puerto Cortez to La Pimienta, 110 kilometres (68 miles) distant. At the beginning of 1902 the total length of telegraph wires was 3166 miles.

Presidential Contest.—A bitterly contested presidential campaign was carried on during the summer and fall of 1902, and the vote on October 25 did not result in an election. There are about 59,000 voters in the country, while about 85,000 votes were cast. The candidates were: Señor Marco Aurelio Soto, Gen. Manuel Bonilla, and

Señor H. A. Rias. Señor Bonilla, who is a cousin of the late President Policarpo Bonilla, received 40,000 votes; Soto, 25,000; and Rias, 20,000. It was stated that the question of the election would be taken up by the congress meeting in January, 1903; meanwhile General Sierra would remain in office. Before the end of the year, however, it appeared that Bonilla would attempt to establish his claim by force, and civil war seemed imminent.

HONG KONG, a British crown colony in Asia, consists of an island lying off the southeastern coast of China, at the mouth of the Canton River, and of a strip of the mainland leased from the Chinese government in 1898 for a term of 99 years. The island, which is separated from the mainland by a narrow strait half a mile wide, has an area of about 32 square miles and a population (1901) of 297,212, largely Chinese. The mainland has an area of 376 square miles and an estimated population of 100,000.

The capital is Victoria, commonly known as Hong Kong. The imperial garrison numbers 4000 men, including the Hong Kong local regiment. The governor in 1902 was Sir Henry A. Blake (since 1897). The revenue, accruing largely from taxes, licenses, and the opium monopoly, amounted in 1900 to 4,202,586 dollars and the expenditure to 3,628,447 dollars. (The dollar is the Mexican silver dollar valued, October 1, 1901, at 46.4 cents, and October 1, 1902, at 41.7 cents.) There is a public debt of £341,800 and a note circulation (1900) of 10,380,538 dollars. Victoria is a free port, and the commerce, which is virtually a part of the commerce of China, is largely trans-shipping. Trade is chiefly with Great Britain, India, Australia, the United States, and Germany, about 50 per cent. being with Great Britain. The import and export trade with Great Britain was (1900) £1,066,048 and £2,762,882 respectively, and is increasing rapidly. The principal articles of export are tea, silks, hemp, preserved fruits, and opium. The tonnage of the registered shipping in 1900 was 29,197.

HOPKINS, ALBERT J., congressman from Illinois since 1885, was endorsed by the Illinois Republican State Convention in September, 1902, for United States senator, thus practically assuring his election as the successor of Senator William E. Mason in the Fifty-eighth Congress. He was born in De Kalb County, Ill., August 15, 1846, and after graduating at Hillsdale (Michigan) College in 1870, studied law and began the practice of his profession at Aurora, Ill. From 1872 to 1876 he was State's attorney for Kane County, was a member of the Republican State central committee of Illinois from 1878 to 1880, and a Presidential elector in 1884. At the same election he was chosen to represent the Eighth Illinois District in the Forty-ninth Congress, and has been re-elected at every succeeding election. He has taken a prominent part in legislation, and in 1899 was a leading candidate for the caucus nomination for speaker to succeed Thomas B. Reed.

HOPKINS, HENRY, who was inaugurated president of Williams College in September, 1902, in succession to Dr. Franklin Carter, is the son of Mark Hopkins, the noted educator, who was president of the same institution for thirty-six years (1836-72). He was born November 30, 1837, in Williamstown, Mass., graduated at Williams in 1858, and studied two years at the Union Theological Seminary in New York City. He was appointed a chaplain in the army by President Lincoln and served through the Civil War as hospital chaplain at Alexandria, Va., and in the field with the 120th New York Volunteers. In 1868 he became pastor of the Second Congregational Church at Westfield, Mass., and, in 1880, of the First Congregational Church at Kansas City, Mo. He was chaplain of the third regiment of the national guard of Montana from 1887 to 1889, and chaplain in 1899 of the commandery-in-chief of the Military Order of the Loyal Legion. He is also a trustee of Williams College, and a vice-president of the American Board of Commissioners for Foreign Missions, and the American Missionary Association. A number of his sermons and addresses have been published.

HOPS. The division of foreign markets of the Department of Agriculture reports the exports of hops from the United States in 1902 to have been as follows: United Kingdom, 9,593,526 pounds, value \$1,401,915; Canada, 570,340 pounds, \$72,664; British Australasia, 413,396 pounds, \$45,986; other countries, 222,889 pounds, \$30,092—total, 10,715,151 pounds, \$1,550,657. The imports were 2,805,293 pounds, valued at \$833,702, of which 2,466,899 pounds came from Germany, 290,783 pounds from Austria-Hungary, and 47,611 pounds from other countries.

Fruwirth and Zielstorff in Germany found that a diminution of nitrogen and phosphoric acid occurred in the leaves and vines of the hop in the fall and interpreted this result as due to a translocation of these substances from the leaves and vines to the other parts of the plant. From his own experiments and observations Remy concludes that a minimum content of phosphoric acid in the lower leaves of the hop plant at the beginning of the blossoming period is an indication of the lack of that element in the soil. He found that the nitrogen requirement of hops varied

greatly with the variety, the English varieties requiring much more nitrogen than those grown on the continent of Europe. Experiments by the Southeastern Agricultural College at Wye, England, have shown that without cultivation as good results are obtained as with deep cultivation. In the experiments reported, a plot of 24 hills, which for seven years received no cultivation except the mere destruction of weeds by the lightest hoeing, yielded 150 pounds of green hops; while two other plots with the same number of hills, one deeply cultivated and the other uncultivated for one year, each gave 144 pounds. A larger tract receiving no cultivation averaged 2400 pounds of dry hops per acre. Where no cultivation was given, the manures were simply put on the surface of the soil. Gross in Bohemia found that pruning largely increased the yield of hops. The unpruned plants developed too many leaves and underground stems for proper cultivation and profitable production.

To aid the hop industry in the United States the Department of Agriculture has secured from various foreign sources varieties which in general are of greater value and better quality than many now grown in this country. It is hoped that by the dissemination of these imported varieties the area now producing inferior varieties may speedily be restricted and the average quality of the American product improved. At present the American hop is fairly rich in lupuline, but is regarded in foreign markets as inferior in quality to varieties grown on the continent of Europe. Progress is being made here in the construction and use of the drying kiln and a better and more uniform product is the result.

HORTICULTURE. Estimates for 1902 place the apple crop at about 43,000,000 barrels as compared with 27,000,000 barrels in 1901. The keeping quality of the fruit has been considerably impaired by wet weather in the Central and Western States. The foreign demand for apples is especially active owing to short crops in nearly all European countries. The American apple trade is being revolutionized by the erection of cold storage plants in the fruit-growing centres and shipments made direct to consuming points. The California citrus crop, which in the early part of the season promised to be a record breaker, was greatly reduced by untoward weather conditions, and only a normal crop was secured. The raisin crop of 100,000,000 pounds was next to the largest ever produced in California. In the eastern United States the grape crop was light. The cranberry crop of 675,000 bushels was about 275,000 bushels less than in 1901. The keeping quality of the crop was also injured by excessively wet weather. The tomato pack in 1902 in the United States and Canada was about double that of the preceding year.

The possibility of shipping perishable fruits to English markets has been investigated by the governments of both the United States and Canada. Summer apples, peaches, grapes, and pears have been forwarded under varying conditions and generally very satisfactorily. The English market for early varieties of American apples has proved especially attractive. Elberta peaches in commercial quantities have been successfully shipped from the orchards of Georgia and Connecticut, via New York, to England, packed only as for the New York market. The work of the United States Department of Agriculture with peaches has clearly brought out the fact that these fruits in cold storage should be held in a temperature of approximately 32° F. rather than 36° to 40° F. as has been commonly the case heretofore. Thus handled the fruit keeps longer without change, holds its flavor better, and is less perishable when taken from cold storage and placed on the market.

Twelfth Census Statistics.—According to the United States Census of 1899, 5,753,191 acres or 2 per cent. of the total area of the country devoted to crops was planted in vegetables. The vegetables grown had a total value of \$238,846,908, which is about 8.3 per cent. of the total value of all farm crops. The average of all farm products per acre was \$10.04, while for all vegetables it was \$42.09. The potato was the most important vegetable grown. It occupied 51.1 per cent. of the total acreage devoted to vegetables, and was valued at \$98,387,614, or \$33.48 per acre. The production was 273,328,207 bushels, an increase of about 25 per cent. over the preceding decade. Sweet potatoes ranked second in value of the vegetables grown in the United States, the yield from the 537,447 acres grown being 42,526,696 bushels, and the value per acre \$36.98. The acreage given to a number of the other more important vegetables is as follows: Watermelons, 199,849; sweet corn, 199,729; tomatoes, 197,489; cabbages, 150,156; muskmelons, 60,854; onions, 47,983; green peas, 30,443; green beans, 15,004; asparagus, 10,192; turnips, 9699; celery, 9327; beets, 8144; and chicory, 3069 acres.

The most important vegetable-growing States mentioned in the decreasing order of their acreage for 1899 are New York, Michigan, Pennsylvania, Wisconsin, Ohio, Iowa, Illinois, Missouri, Virginia, Indiana, Texas, and Minnesota. The heaviest yielding potato States were New York, Wisconsin, Michigan, and Pennsylvania. Georgia, North Carolina, Alabama, South Carolina, and Texas led in the order named in the production of sweet potatoes; New York and Ohio in the production of onions; New York, Illinois, and Michigan in cucumbers; Texas and Georgia in

watermelons; New Jersey, Illinois, and Texas in muskmelons; New York, Virginia, Pennsylvania, and Illinois in cabbage; California and New Jersey in asparagus; and Michigan, New York, and California in celery. Michigan produced over 92 per cent. of the chichory grown in the United States. Commercial gardening, that is, truck and market gardening, appears to have increased about 100 per cent. at the North, and fully 200 per cent. at the South during the decade.

Relative to the canning industry, the statistics show that the yearly output is now about double that of a decade ago. The pickles, preserves, and sauces put up in 1900 were valued at \$21,507,046, and the canned fruits and vegetables at \$56,668,313, of which the vegetables approximated but did not exceed one-half the total value. About two-thirds of the vegetables canned consist of corn and tomatoes. Peas stand next in importance. The number of cases of vegetables holding 24 cans each packed in 1899, was as follows: Tomatoes, 8,905,833; corn, 6,365,967; and peas, 2,738,251. Standard tomato cans hold 3 pounds each, and corn and pea cans 2 pounds each. Maryland and Indiana were the heaviest packers of tomatoes, New York and Illinois of corn, and Maryland and New York of peas. Considerable quantities of such other vegetables as asparagus, lima beans, string beans, okra, pumpkin, squash, succotash, sweet potatoes, etc., are yearly put up in cans. The prices of canned goods have decreased about 25 per cent. during the last decade.

The total value of all fruits produced in the United States in 1899 was \$131,423,517. Orchard fruits alone were valued at \$83,751,840; grapes, \$14,090,937; small fruits, \$25,030,877; and subtropical fruits, \$8,549,863. During the last decade orchard fruit production as a whole increased 15.4 per cent. Apples alone constituted 55 per cent. of all orchard trees, peaches and nectarines, 27.2 per cent.; and plums and prunes, 8.4 per cent. The total acreage of small fruits was 304,029, and the value of the product per acre \$82.33. Strawberries constituted about 50 per cent. of the total acreage of small fruits. Raspberries stood next in importance.

The total value of all cultivated nuts was \$1,950,161. California alone reported 73.9 of this total. That State leads in the production of almonds and English walnuts. Texas leads in the production of pecans.

In 1899 there were 30,417 farms reporting land under glass representing a total of 96,230,420 square feet, or over 2200 acres. Of this number, 6159 were commercial florists' establishments having about 51,023,000 square feet of land under glass. The total wholesale value of floricultural products was \$18,759,464, of which \$17,377,860 was for florists' products. The retail value, it is thought, could not have been less than \$30,000,000. The annual income from cut flowers alone is estimated at \$12,000,000 to \$14,000,000. The sale of cut roses is estimated at \$6,000,000; carnations, \$4,000,000; violets—which stood third in importance—\$750,000; and chrysanthemums, \$500,000. The annual production of roses and carnations is 100,000,000 each; violets, 75,000,000. The average prices for roses and carnations is 20 to 25 per cent. higher than ten years previous, while violets, lilies of the valley, and tulips have considerably decreased in price.

Relative to the nursery business, the twelfth census showed a total of 2029 establishments with 137,459 acres devoted to the growing of young trees. The value of the products from this area was \$9,231,503. New York leads in the production of nursery stock with a total of 237 establishments, yielding products valued at \$1,703,354. Other leading States in value of product, are Iowa, \$636,543; Illinois, \$610,971; California, \$533,038; Ohio, \$538,534; and Pennsylvania, \$515,010.

Experiment Station Work.—Among the leading facts recently brought out by the experiment stations in the United States along horticultural lines are the following: Dwarf tomatoes promise to give larger profits when grown under glass than do the standard sorts usually grown. Rane found that dwarf tomatoes mature fully as early as the standard sorts, bear through a longer period, and are more productive area for area. Waldron has shown that the common practice in eastern States of cultivating orchards up to the middle of the summer and then seeding down to some cover crop will not do at all in the cold, dry Northwest.

Cultivation there should be continued right up to late fall in order to conserve every drop of moisture in the soil and should be followed by a mulch of straw or litter, to prevent further drying of the soil during the winter. Cranfield in Wisconsin found that all fruit tree growth at the station had stopped by July 10 though root growth continued until October. A number of stations have reported further work on the self-fertility or self-sterility of many of our orchard fruits and grapes. The list of self-sterile sorts has been considerably enlarged, while many sorts hitherto considered self-fertile have been found to bear larger and better fruits when cross-pollinated, thus emphasizing more strongly than ever the great desirability of mixing varieties in orchard plantings. With plums Waugh considers that at least every third row should be of a different sort.

The New York stations have pointed out the fact that it is a common mistake among farmers engaged in intensive operations to use too much commercial fer-

tilizer. For onions on good soil 500 pounds of mixed fertilizers gave very nearly as good yields as 2000 pounds, while the danger from financial loss was considerably lessened. More cultivation and less fertilizer is advocated. Hume at the Florida station has presented a monograph of the Peen-To peach group. Voorhees in New Jersey has brought out more clearly than ever the value of an extra supply of nitrate of soda for market garden crops, and the advisability of applying it two or three different times during the growing season. Rane has presented a system of classification for watermelons.

The Canadian stations have made great progress in crossing apples to secure hardy varieties for the cold Northwest. The small hardy *Pyrus baccata* has been crossed with such hardy improved varieties as Tetovsky, Wealthy, and Duchess. Already sixteen or seventeen named varieties have been obtained. The apples are small but promise great usefulness to the people of those regions. Some of them make very good apple sauce and all exceedingly good jelly.

Etherization of Plants.—In Europe, particularly in Germany, the forcing of plants by means of the fumes of ether is coming rapidly into commercial importance. The principle observed in etherization is completely to arrest growth and force the plant into its resting period earlier than usual, after which it is placed in the greenhouse under ordinary forcing conditions. In practice the plants are placed in an air-tight chamber and subjected to the fumes of sulphuric ether for 48 to 50 hours at a temperature of 50° to 60° F. About 400 grams of ether is considered sufficient for a cubic metre of air. Lilacs are among the plants most commonly etherized, though nearly all shrubs, as well as bulbs, respond readily to the influence of etherization. Etherization hastens the blooming period of lilacs and most plants two or three weeks or more.

New Hybrid Fruits.—The first hybrid fruits resulting from crossing the hardy *Citrus trifoliata* with sweet oranges, for the purpose of securing an orange of good quality that could be grown much farther north than any of the present commercial varieties, were obtained during the past year. Such fruits are reported from the Department of Agriculture at Washington, from Texas, and from Louisiana. The fruits obtained are reported to be of fair quality, about the size of a tangerine, nearly seedless, and in the case of the report from Louisiana, to withstand a zero temperature. The fruit obtained in the case of the experiments of the Department of Agriculture more nearly resembles the lemon than the orange. It promises to be of much usefulness for culinary purposes and for the production of a beverage. Dr. Webber, of the Department of Agriculture, also describes a fruit obtained by crossing a pomelo and a tangerine. It is intermediate in size between the two, can be readily peeled like the tangerine, and separates into segments. As a breakfast fruit it is believed to be very desirable, having an acid flavor, but being much less bitter than the ordinary pomelo. This fruit is being propagated for distribution as a valuable new creation under the class name of the "tangelo."

The subject of plant hybridization has had a remarkable impetus during the past year from the rediscovery and confirmation by several European and American investigators of certain laws of hybridization deduced by Gregor Mendel, at Brünn, Austria, from experiments made with peas in 1865. Mendel's paper attracted little attention when published, owing to the greater interest of scientists in the theory of evolution proposed about that time by Darwin. Stated briefly the law as deduced from peas is that in the second and later generations of a hybrid all possible combinations of the parent characters appear and in definite proportions of the individual plants. The theory propounded and proved to explain this phenomenon is that in respect to certain pairs of differentiating characters the germ cells of a hybrid, or crossbred, are pure and carry and transmit one character only, not both. The dominant feature of the International Plant Hybridization Congress held in New York, September 30 to October 2, was the discussion of Mendel's law and its bearing on future work in plant and animal breeding. As a working hypothesis the theories of Mendel promise to be the most fruitful of results of anything thus far proposed since Darwin's theory of evolution.

School Gardens.—The school garden movement, long a feature of many European countries, has made rapid progress in the United States during the past year. The work is being encouraged by municipal and civic clubs, college settlements, factories, and many city and village schools. In the schools it is an important supplement to the nature study movement. A model school garden, an acre in extent and under the direction of the United States Department of Agriculture, is announced as a feature of the forthcoming St. Louis Exposition. The development and functions of school gardens, with a bibliography of the literature on the subject, is given in the *Outlook* (1902, No. 14) by D. J. Crosby.

Literature.—In horticultural literature the chief event of the year has been the appearance of the fourth volume of Bailey's *Cyclopedia of American Horticulture*, thus completing this monumental work and classic in American horticulture. The

year has also seen the complete revision under the general editorship of William Watson of the entire six volumes of Thompson's *Gardener's Assistant*, the well-known English cyclopedia of horticulture. The German illustrated *Cyclopedia of Garden Culture*, by T. Rümpler has also undergone an extensive revision during the year. The series of handbooks of practical gardening, issued by John Lane, under the general editorship of H. Roberts, has now reached fourteen numbers, including books on the following subjects: The Book of Asparagus, Greenhouse, Grape, Old-Fashioned Flowers, Bulbs, Apple, Vegetables, Orchids, Strawberry, Climbing Plants, Pears and Plums, Herbs, Wild Garden, and Bees. All of these subjects are treated from the standpoint of English conditions. The art of gardening as developed in America has been brought out in a book by G. Lowell on American gardens, a quarto publication richly illustrated. The commercial side of horticulture has been contributed to by J. Pacrette in a 200-page octavo volume, entitled *The Art of Canning and Preserving as an Industry*. The *Australian Gardener*, a monthly journal of sixteen to eighteen pages, and devoted mainly to floriculture, issued its first number in July. *Meehan's Monthly*, established in 1891 and devoted to general gardening and wild flowers, ended its existence with the December issue. *American Horticulture Manual*, part i., by J. L. Budd.

HOSPITALS. The new lying-in hospital in New York City built by J. P. Morgan, was opened early in the year 1902. The building, which is at Seventeenth Street and Second Avenue, is eight stories high, and is built with every modern convenience for obstetrical work. A bill has been introduced authorizing the construction of a smallpox hospital in the Borough of the Bronx, New York City. The building is to cost \$300,000 and the site \$200,000, and the hospital is to be devoted to cases of infectious and contagious disease. St. Vincent's Hospital, New York City, is to have a splendidly equipped sanatorium near Suffern, N. Y., for convalescents. The building will accommodate at least thirty private patients, and will be in charge of the Sisters of St. Vincent's Hospital. The new building of the New York Ophthalmic and Oral Institute will shortly be erected at West Sixty-fourth Street and Central Park. The trustees of Bellevue and allied hospitals in view of the unsanitary and antiquated condition of these institutions, have urged Mayor Low to provide a new hospital of modern design without delay, and the mayor has virtually pledged his administration to increase the number of hospitals for the treatment of contagious diseases, and to provide for this purpose a fund of \$2,000,000 to be expended in the next three years. Only 9½ per cent. of cases of infectious diseases in New York are now treated in hospitals. It has been decided to construct an emergency hospital at Annapolis, the number of accident cases which have occurred lately making this step necessary. An isolation building has been erected on the grounds of the Noble Hospital at Westfield, Mass., with accommodations for ten patients. A bill for the establishment of a State commission to consider the establishment of a hospital for tuberculous patients has been introduced in the Maryland senate. The Pennsylvania legislature will be asked to pass a bill appropriating \$300,000 for the enlargement and improvement of the White Haven Consumption Sanatorium for the free treatment of poor consumptives. If this appropriation is passed, Pennsylvania will have given more than any State in the Union for the care of the consumptive poor. It is proposed to establish other sanatoriums like that at White Haven throughout the State. The method of treatment is outdoor life with forced feeding. The State Tuberculosis Commission of New Jersey decided to purchase 400 acres of land at Glen Gardner as the site for the New Jersey Hospital for Consumptives. The plans for a new county insane hospital at Weyanwega, W. Va., have been approved and contracts given for the erection of a building to accommodate 125 patients. Philadelphia is to have a new almshouse and insane hospital. After a good deal of debate it has been decided to utilize the House of Correction property at Holmesburg, which consists of over 150 acres of high land, easily accessible and already owned by the city. About \$300,000 will be devoted to the buildings. The site recently chosen for the Municipal Hospital is about five miles southwest of this property. The Walker Hospital for Europeans, at Simla (India), was opened for the reception of patients on May 1, 1902. In 1902 Mr. John Master-son Burke, of New York, gave \$4,000,000 for founding a home for convalescents in that city.

HOTT, JAMES WILLIAM, bishop of the United Brethren Church, died at Dayton, O., January 9, 1902. He was born near Winchester, Va., November 15, 1844, entered the ministry in 1861, and was ordained in 1864. He became editor of the *Religious Telescope* in 1877, and was chosen a bishop in 1889, and re-elected three times. He traveled extensively in foreign lands, and was the author of *Journeyings in the Old World* (1882), and of *Sacred Hours with Young Christians* (1892), besides numerous doctrinal and other papers for periodicals. His *Life*, by the Rev. Marion R. Drury, D.D., was published in 1902.

HOUSING PROBLEM. The most serious problem confronting the social reformer of to-day is the question of supplying habitable quarters for the poor at rates within their means and still paying dividends on the investment. Each city has its own problem which must be solved in a way determined by the topography of the vicinity and the social structure of the population. More attention was given to the housing question in 1902 in the United States than ever before. The New York State Tenement House Law was put into operation with good results. Efforts were made in nearly all large cities to prevent further overcrowding and to relieve the evils existing. An excellent account of the legal regulations of tenement houses and the particular problems to be met in the principal cities of the United States is given in the *Annals* of the American Academy of Political and Social Science for July, 1902. Hon. Robert W. de Forest treats of tenement house regulations, Miss Jane Addams gives Chicago conditions, the *Report* of the Octavia Hill Association treats Philadelphia, Mr. Robert Treat Paine writes of Boston, while the housing problem in Jersey City is stated by Miss Mary B. Sayles, fellow of the College Settlements Association. A brief summary of these papers will give an idea of the progress toward social betterment in American cities.

Tenement House Regulations.—Legally a tenement house is a dwelling inhabited by three, or, in some cities, by four families. The necessity for regulating the construction of such dwellings has led to a considerable body of legislation. Protection from fire is almost universal. In all cities of the United States, the kind of materials and the mode of structure are prescribed by law. In New York, Philadelphia, San Francisco, Jersey City, Providence, Syracuse, and Nashville, all tenements must have fire escapes. In St. Louis, Baltimore, Louisville, Minneapolis, St. Paul, Denver, Toledo, and Columbus, O., all tenements above two stories, and in Chicago, Cleveland, and Cincinnati, all above three stories must have fire escapes. In many cities, tenements above a certain height must be fireproof throughout. In Philadelphia the limit is four stories, in Washington five stories, in New York, Buffalo, Louisville, Minneapolis, and Denver six stories, and in Boston 65 feet. Light and ventilation are provided for by ordinances regulating the size of yards and air shafts. Buffalo, Boston, Philadelphia, and New York are foremost in such legislation. Water supply and water-closet accommodations are regulated in most of the larger cities, as is also the occupancy of cellar dwellings. Building regulations have a direct effect upon the cost of rents as well as the conditions of living. Sometimes laws cannot be enforced, because if they were thousands would be deprived of all shelter, and the worst habitation is better than none at all.

In Chicago conditions are unique. In the poorer districts the tenements are often inhabited by the owner. Especially is this true of the Bohemian quarter and to a lesser extent of the Italian quarter. This makes the question of improving conditions all the more difficult, as the opposition of both landlord and tenant must be reckoned with. Overcrowding is almost incredible. If the average tenement house density prevailing in the Bohemian, Italian, Russian-Jew, and Polish quarters extended over the 187 square miles of Chicago, the city would have a population of 23,000,000. On an area of one-seventh of an acre 130 people were living when the committee of the Homes Association made its report in 1901. At this rate all the people of the Western Hemisphere could be housed in Chicago. More than a hundred "double-decker" tenements were found by the committee, and many more escaped this classification only by a technicality in the definition adopted. Conditions in the single houses and apartments were quite as bad, often worse than in the "double-deckers" of evil name. Rents in the poorer districts are very low. The problem of supplying decent accommodations at rentals within the reach of these people is most difficult. The inducements of better surroundings have no weight with them, if betterment involves an increase in rent, and it is impossible to better their conditions without increasing rents.

Philadelphia is commonly supposed to have no housing problem. The report of the Octavia Hill Association for 1901, revealed serious evils existing in the city and showed the necessity of immediate and vigorous measures to prevent further growth of overcrowding. This association is a stock company organized to improve the poorer sections of Philadelphia by methods similar to those of Miss Octavia Hill in London. Its aim is to improve old houses and small properties rather than to build new dwellings. It employs women rent collectors, both salaried and volunteer. Its capital stock is \$50,000, paying 4 to 4½ per cent. dividends. It has demonstrated the practicability of remodeling the houses in the poorer districts into decent dwellings and of still making reasonable profits. It now has under its care seventy-seven houses, sixty-five of which are small houses for single families, and twelve are tenements of eleven or twelve rooms each. The aim is to improve the neighborhood gradually by showing the people better ways of living. The population of Boston has increased from 1871 to 1901 by 25.3 per cent., while the number of dwelling houses increased only 22.8 per cent. Four per cent. of the dwellings are

vacant, and it is likely that conditions have not improved. Increased facilities of transport and the cooperative banks have greatly helped to build up suburban homes and to relieve the pressure of population in the centres. The Boston Cooperative Building Company and the Workingmen's Building Association are building good houses at reasonable cost, and are making fair profits. These building associations cannot, however, meet the needs of the sections most in need of better houses. The necessity for relief from present evils is told by the high death-rate in the slums—more than double the rate in the better sections of the city, in some cases. Jersey City is another city which is supposed to have no housing problem, but the special investigations made by Miss Sayles brought out the fact that much overcrowding exists in certain quarters, especially among the foreign born. The worst examples of overcrowding to be found in the United States, exist in certain areas in New York City. The density of population in the Polish quarter in Chicago is three times that of the most crowded portions of Tokio or Calcutta; but Chicago's densest quarters are not so overcrowded as the worst sections of New York. Although the density per acre is greater in New York, the density per room is not greater than in other cities named. The problem of relieving the congestion is immensely greater, however, not only because of the greater numbers to provide for, but because of the difficulties of providing transportation accommodations. The topography is such that most of the travel must be north and south. The distance to the suburbs is correspondingly greater and rents higher. The underground railway, the new bridges over the East River, the tunnels to Brooklyn and the Pennsylvania Railroad tunnel, it is hoped, will enable many thousands who are now compelled to reside on Manhattan Island to live in Long Island, New Jersey, or the Bronx. The new tenement house law, which went into effect the latter part of 1901, has already improved conditions in the worst sections. A strong effort was made to overthrow the law in the legislature in 1902, but failed. A new attempt is now on foot to repeal portions of the law compelling the abolition of sinks and regulating dimensions of light and air space.

In England the housing question has been under consideration longer than in America, and greater advancement has been made in many ways. Greater powers are conferred upon the local and municipal authorities to regulate building, to condemn unsanitary buildings, and to erect municipal tenements. In spite of all efforts the situation does not improve. The wiping out of one slum simply means further overcrowding in other quarters. In West Ham, one of the boroughs of London, the Socialistic party got control and attempted to solve the housing problem. The London *Times* regards the result as a clear failure. Wages were fixed 20 per cent. above the union scale and the eight-hour day was made universal. Twenty-seven municipal dwellings were built for workmen and leased at an annual loss of £4 per house. Expenditures increased from £13,000 to £30,000 a year, and the rates rose from 9s. to 10s. 6d., the proportion levied by the borough council rising from 2s. 7d. in 1890 to 4s. 8½d. in 1901. Rents rose 12½ to 20 per cent. Finally the Socialistic majority advocated the expenditure of nearly £3,000,000 on public works, £1,675,000 to go for municipal dwellings. This led to the defeat of their candidate in 1902, and this attempt to eliminate the slums by paying more than the market wages and supplying better houses at less than cost, was abandoned. The Socialists claim that great good was accomplished, the worst slums were eradicated and great improvements justified the increased expenditures. It is doubtful if any permanent benefit was accomplished. A more hopeful remedy for existing evils was proposed by Mr. Ebenezer Howard in his *Garden Cities of To-morrow*. He advocates the purchase of cheap land in rural communities by a corporation, and the transplanting of industries to the new site, which will be built upon a definite plan that will prevent overcrowding and the other evils of tenement life in the great cities. This plan is being partially followed out at Bournville, a suburb of Birmingham, by Mr. George Cadbury. The conference of the Garden City's Association was held there in 1902, and the practical working of the plan was demonstrated. A movement peculiar to England is the effort to improve housing conditions of rural districts. Often it is found that overcrowding and most unwholesome conditions exist among the cottagers and tenantry in the country. In several cases, landlords were induced to provide decent houses for their tenants, and the movement is spreading.

HUDSON RIVER TUNNELS. See TUNNELS.

HUGHES, HUGH PRICE, an English clergyman, died November 17, 1902, in London. He was born in 1847 at Carmarthen, and studied at University College, London, and Wesleyan Theological Seminary at Richmond. He had decided early in life to become a Methodist preacher, and in 1869 received his first pastorate, at Dover. He remained in every pastorate to which he was appointed for the three years allowed by his denomination, and became superintendent of the West London Mission when it was founded in 1887. The three-year rule was suspended in the

case of the mission, and he remained with it until his death. Large congregations were regularly attracted by his preaching, and from the first the mission grew rapidly in size and influence. A nursing sisterhood, thrift societies, poor relief operations, and kindred agencies were added to the mission. He became identified with the social purity movement and his vigorous attacks on all phases of corruption, including various statutes as well as officials of the city, had a far-reaching effect. He was uncompromising in his theological views, but gradually became less and less prone to controversy in such matters. Under his editorship the *Methodist Times* became the most powerful paper of the Wesleyan Church. In 1898 he was elected president of the Wesleyan Conference, and upon the movement for federation among the Non-conformist churches, became president of the National Council of Evangelical Free Churches. He published *Social Christianity*; *Ethical Christianity*; *Essential Christianity*; *The Atheist Shoemaker*; and *The Philanthropy of God*. From the similarity of methods employed in his efforts toward social improvement, he was often referred to in the American press as "the Dr. Parkhurst of London."

HUMBERT CASE. The year 1902 added one more *cause célèbre* to the long list that has given to the history of justice in France almost the character of a series of romances. Briefly stated, the facts of the case appear to be as follows: Some twenty years ago M. Frédéric Humbert, the son of Gustave Humbert, minister of justice in the cabinet of M. de Freycinet in 1882, appeared in Paris with his wife, who had been Thérèse D'Aurignac, the daughter of a lace merchant of Toulouse. The official position of the elder Humbert gave them entrance to society and they were enabled to keep up a city house with considerable magnificence, in which they entertained lavishly. The funds by which this establishment was maintained consisted of loans obtained from various sources, on practically no security whatever, the creditors, if inclined to question the Humberts' solvency, being satisfied by rather indefinite stories of an expected inheritance that at different times was said to consist of a large estate near Tarbes, or the property of a fabulously wealthy Portuguese nobleman, who had been a "friend" of Mme. Humbert's mother. There were some who doubted the existence of these fortunes, but if they happened to be creditors they were always appeased by the payment of a part or the whole of their loan from funds borrowed for the purpose from others; if they happened to be disinterested persons their doubts were generally smothered by unusual social attentions from the Humberts. In 1885 the hope of realizing on the estate at Tarbes and the Portuguese millions was evidently abandoned, for from that time on Mme. Humbert's "security" underwent a new and very remarkable change. Thereafter credulous lenders were told a story something like this: Under the last will and testament of a certain Robert Henry Crawford, a wealthy American, Mme. Humbert explained, his entire fortune of 100,000,000 francs had been left her as a mark of his gratitude for her having once nursed him in a serious illness. In order that this legendary fortune should be accepted as the equivalent of negotiable securities Mme. Humbert devised an ingenious scheme whereby a legal certification of the Crawford millions could be obtained and at the same time a demand to show the actual securities might be averted. This was no less than the invention of a second will, which left the entire fortune to be equally divided between Crawford's two nephews and Marie D'Aurignac, a younger sister of Mme. Humbert, providing that person with only a small annuity. Pending the settlement of the inheritance, Mme. Humbert produced an agreement, purporting to be signed by the Crawfords, providing that the 100,000,000 francs in securities should be sealed up and deposited in a safe to be left in Mme. Humbert's keeping, but with the stipulation that she should not open the safe under penalty of forfeiting all claim to the estate. This scheme of tying up the fictitious inheritance by means of perfectly legal proceedings was a positive stroke of genius. Under English or American legal procedure the deception could not have been possible for a year; in France for a period of twenty years during which the "settlement" was pending the Humberts lived in luxury, maintained country châteaux and city houses, a yacht, and a box at the opera, gave largely to charitable institutions and continued to be received in the best official society. Some few creditors who insisted on repayment were actually paid, but most of them were satisfied with a sight of the famous agreement and other legal documents relating to the settlement, or with a view of the outside of the little safe in which the Crawford millions were said to repose. The Humberts' borrowings ran from 250,000 to 7,000,000 francs, the total probably reaching at least 60,000,000 or 70,000,000 francs. During all these years, although many seem to have questioned the truth of the story or actually declared it to be a colossal fraud, the Humberts remained unmolested, and there have been persistent rumors that persons in high authority were shielding them. The climax came in May, 1902, when, as a result of one of their numerous legal difficulties, the courts ordered the mysterious safe opened. Unable longer to keep up the deception, the Humberts disappeared. The safe was opened the next day

and found to contain only some paste jewelry and worthless papers. The inability or disinclination of the government to find the fugitives renewed the rumors of official collusion, which their discovery, late in December in Madrid, where they had lived quietly since June, did not allay. With no more ado they were taken back to Paris to await trial. The feeling that the government had acted in a lax manner manifested itself at length in the Chamber of Deputies, where, however, an interpellation resulted in a vote of confidence in the ministry by a large majority.

HUMPHREYS, ALEXANDER CROMBIE, an American engineer, who in the autumn of 1902 succeeded the late Henry Morton as president of the Stevens Institute of Technology, Hoboken, N. J., was born in Edinburgh, Scotland, March 30, 1851, and was brought by his parents to the United States in 1859. When prevented by age restrictions from entering the United States Naval Academy, to which he had been appointed at the age of fourteen, he began work in a Boston insurance office; and after six years' service in the office of a New York firm he became secretary and then superintendent of a gas company in New Jersey. In 1877 he entered Stevens Institute as a special student, and despite the duties of his regular business life graduated with his class four years later. He then engaged in the construction of oil-gas works, as chief engineer of the Pintsch Lighting Company, and in 1885 was appointed general superintendent of the United Gas Improvement Company, a position which he held until his resignation in 1894, when he established in New York the firm of Humphreys and Glasgow. His influence on the system of management in gas-lighting companies has been very marked, and he has made experiments of great value in the manufacture of water gas.

HUNGARY. See AUSTRIA-HUNGARY.

HYATT, ALPHEUS, an American zoologist, died January 15, 1902, at Cambridge, Mass. He was born at Washington, D. C., April 5, 1838, and was a student at the Maryland Military Academy and Yale University, leaving the latter institution after his freshman year to travel in Europe. On his return in 1858 he entered the Lawrence Scientific School of Harvard, where he studied zoology under Louis Agassiz. Graduating in 1862, he served throughout the Civil War in the Forty-seventh Massachusetts Volunteers, and reached the rank of captain. After studying in Europe he returned to America, and in 1867 became a curator in the Essex Institute of Salem, Mass. He was one of the founders of the Peabody Academy of Sciences in Salem and also of the *American Naturalist*. As one of the Salem school of zoologists Hyatt's reputation soon spread, and in 1870 he was elected custodian, and in 1881 curator, of the Boston Society of Natural History. A professorship of zoology and paleontology at the Massachusetts Institute of Technology, the oversight of the Museum of Comparative Zoology in Cambridge, and work for the United States Geological Survey comprised only a part of his work, and his success as a teacher and promoter of investigation was most marked. He founded a marine biological station at Annisquam, Mass., for his students, and actively participated in establishing the Teachers' School of Science, which was held in the rooms of the Boston Society of Natural History. One of the founders of the American Society of Naturalists, he was its first president and in 1875 was elected a member of the National Academy of Sciences. He was LL.D. of Brown University (1898), and a member of many scientific societies both in America and in Europe.

Professor Hyatt's researches dealt mainly with invertebrate animals, both fossil and recent, and he was a recognized authority in the group of tetrabranchiate cephalopods known as ammonites, the evolution of which he has discussed most minutely. He published many papers on fossils and evolution, while his *Commercial and Other Sponges* (1879), was considered one of his best pieces of work. All of his scientific investigation was marked by a thoroughness of observation and study, and he is known as the founder of a distinct school of zoological research in which exact methods are demanded. Hyatt's more important publications include: *Observations on Fresh-water Polyzoa* (1866-68), *Fossil Cephalopods of the Museum of Comparative Zoology* (1872), *Revision of the North American Porifera* (1875-77), *The Genesis of the Tertiary Species of Planorbis at Steinheim* (1880), *Genera of Fossil Cephalopods* (1883-84), *Larval Theory of the Origin of Cellular Tissue* (1884-85), *Genesis of the Arietidae* (1889), *Bioplastology and the Related Branches of Biologic Research* (1893), *Phylogeny of an Acquired Characteristic* (1894), *Cephalopoda* (1900).

HYBRIDIZATION. See HORTICULTURE (paragraph New Hybrid Fruits).

HYDROPHOBIA. See RABIES.

HYGIENE. A New York sanitary engineer found as much as 26.2 parts of carbonic acid gas per 10,000 volumes of air in the trolley cars of that city. This is to some extent due to insufficient heating of the cars, the windows in winter being of necessity tightly shut. The cocoanut-husk mats on the floors of the cars have

been examined, and fibres $1\frac{1}{2}$ inches long found to contain from 3,000,000 to 4,000,000 bacteria. As bad as these findings are, they compare favorably with conditions on many railroads. In the Mont Cenis Tunnel the air contains 107 parts of carbonic acid gas; in cars in the Mersey Tunnel in England 26.4 parts; in an electric car in the new Boston subway 24.97 parts; and in the Metropolitan Railway Tunnel in London 89.4 parts per 10,000 volumes. The health commissioner of New York City, from the examination of 55,000 children in 36 schools found no less than 12 per cent. afflicted with contagious diseases of the eye, principally trachoma. A routine examination to prevent the attendance of such children is to be regularly made in the future. The unwisdom of excluding all children suffering from trachoma has been pointed out by numerous physicians, for, since there are no proper hospital facilities for the treatment of such cases, and since the dispensary treatment lasts for months, the result of the regulation will be that large numbers of children will be kept out of school. The International Sanitary Congress was held at Havana, in February, 1902, Major Gorgas, U. S. A., presiding at the opening session. The opening address was made by the president of the congress, Dr. Santos-Fernandez of Havana. Many important subjects were considered, embracing sanitation, hygiene, malaria, leprosy, yellow fever, and mosquitoes, at the Sanitary Congress held in Manchester, England; among other important matters the dust problem was considered. Sir J. Crichton Browne pointed out that notwithstanding the successful crusades against it, dust was responsible for an appalling amount of suffering, disablement and death. A detailed examination of conditions in the twenty-two principal dusty trades showed that it was the dust that was responsible for their unhealthfulness. The alarming mortality among miners was due to ganister dust (brought to light by Drs. Birmingham and Shaw), which kills, not by inducing phthisis in the ordinary sense of the word, but by setting up widespread fibrous changes in the lungs (fibroid phthisis), to which tuberculous infection was secondary. The thirteenth annual meeting of the American Public Health Association was held at New Orleans, in December, 1902. Reports of the committees on the disposal of refuse materials, and on animal diseases and animal food, were presented. The former stated that the disposal of city refuse had not materially improved during 1902. Many of the largest cities in America had reduction plants for the extraction of the grease from garbage. Feeding kitchen garbage to swine as a method of disposal was advocated by a prominent health officer, but opposed by the majority of sanitarians. Many other papers and reports were read, among the most important of which were those on vital statistics, public health legislation, disinfection, leper homes, and yellow fever. See GAS, ILLUMINATING AND FUEL; TUBERCULOSIS; YELLOW FEVER.

ICE HOCKEY. In the Intercollegiate Hockey League, composed of Yale, Harvard, Princeton, Columbia, and Brown, the championship for 1902 was won by Yale with 4 victories and no defeats. Harvard was second with 3 victories and 1 defeat (Yale). Princeton defeated Columbia and Brown and lost to Yale and Harvard. Columbia won from Brown and lost to all the others, and Brown lost all of her games. An extra series of two games was played between Yale and Harvard, both contests being won by Yale. The championship of the Amateur Hockey League of New York City was won by the Crescent Athletic Club of Brooklyn, which defeated the New York Athletic Club in an extra game to decide a tie. The teams finished as follows: Crescent Athletic Club, won 6, lost 2; New York Athletic Club, won 6, lost 2; Hockey Club of New York, won 5, lost 3; St. Nicholas Skating Club, won 3, lost 5; Brooklyn Skating Club, won none, lost 8. In the Amateur Hockey League of Canada, the Montreal team won the championship with 6 victories and 2 defeats. The other teams finished as follows: Ottawas, won 5, lost 3; Victorias, won 4, lost 2; Quebecs, won 3, lost 4; Shamrocks, won 1, lost 7.

ICELAND, an island lying about 250 miles east of southern Greenland, constitutes a Danish colony. Its area is 39,756 square miles, and its population (1901) 78,489. The capital is Reykjavik. The head of the administration is a minister appointed by the Danish crown, while local executive authority is vested in a governor, and the legislative power is an assembly, the Althing. Imports and exports in 1899 were valued at 2,403,000 kroner and 2,660,000 kroner, respectively; in 1900, 2,386,000 and 2,993,000, respectively. The krone is worth 26.8 cents. The leading exports include wool, dried fish, mutton, ponies, and sheep. Trade is chiefly with Denmark. Economic conditions in Iceland are improving. Commerce, which used to be carried on chiefly through barter, now conforms more nearly to modern methods. It appeared in 1902 that Iceland would benefit in the fact that the fishing area of the North Atlantic is moving northward, and the Danish government undertook a piscatorial survey in waters near Iceland and the Faroe Islands. In Iceland salmon fisheries were being exploited in 1902 and plans were made for the establishment of large canning factories along the rivers.

On January 10, 1902, a royal decree stated the willingness of the Danish govern-

ment to conclude an arrangement whereby the minister for Iceland should leave Copenhagen and reside at Reykjavik, and should use the Icelandic language. The provisions of this decree, which was well received by the Icelanders, subsequently became law, and it seemed that the long existing constitutional strife between the colony and the mother country was at an end.

IDAHO, a northwestern State of the United States, has an area of 84,290 square miles. The capital is Boise City. Idaho was organized as a Territory March 3, 1863, and admitted to the Union July 3, 1890. The population in 1900 was 161,772, while in June, 1902, as estimated by the government actuary, it was 177,000. The largest city in 1900 was Boise City, with a population of 5957.

Finance.—The report of the treasurer for the biennial period ending January 1, 1903, shows that the balance on January 1, 1901, was \$130,980. The total receipts during the term were \$1,889,066.40, and the disbursements \$1,302,291.83, leaving a balance on January 1, 1903, of \$717,755.34. The largest sources of revenue were: From the general fund, \$609,562.36; general school fund, \$204,869.73; common school fund, \$88,766.79; and bonds amounting to \$102,000 face value, issued at a premium to meet the deficiency of 1901, \$105,526.32. The bonded indebtedness of Idaho on January 1, 1901, was \$443,500. There were redeemed, during the term, bonds amounting to \$90,000, and there were issued bonds amounting to \$198,000, of which \$102,000 were for funding the deficiency in 1901, making a net bonded indebtedness on January 1, 1903, of \$551,500. Idaho is one of the few States that do not have a State banking law. On account of the rapidly increasing commercial interests of the State, it was recommended by the State officials that a banking law be passed similar to that of other States and requiring State supervision and examination of all State banks. Another recommendation was that an adequate and equitable system of taxation for mining property be passed. This was deemed especially important, as the mining industry stood among the first in the State as a producer of wealth.

Agriculture and Industries.—All crops in 1902 were above average, and all the principal ones showed a considerable increase in acreage. There was as usual an excellent crop of hay in the valleys in the northern part of the State, the production being 955,676 tons, valued at \$5,256,218. The Twelfth Census placed the acreage of wheat for 1899 at 266,305. According to the statistics of the Department of Agriculture, this had increased to 273,080 acres in 1902 and promised a further increase in 1903. The total wheat production in 1902 was 6,021,946 bushels, slightly more than half being spring wheat; the value of the crop was placed at \$4,215,362. The acreage of oats was 81,064 acres in 1902, as against 64,739 acres (according to the census) in 1899. The yield was 3,412,794 bushels, valued at \$1,638,141. Barley increased in acreage from 32,798 acres to 37,731 acres. The 1902 crop, according to the *Crop Reporter*, was 50 per cent. above the average, yielding 1,746,945 bushels, valued at \$925,881. Flaxseed produced in 1902 was valued at \$307,878, and corn \$78,744. The larger part of these crops was raised by the aid of irrigation. The census returns for 1899 give the total crop area as 953,545 acres, of which 508,183 acres were irrigated. The construction of the systems then in use cost \$4,168,252, and the value of the irrigated crops for 1899 was \$5,440,962.

Abundant hay and grain favored a large growth in stock-raising. On December 31, 1902, Idaho had 4,541,815 sheep, valued at \$11,612,513—a number exceeded only by Montana, Wyoming, and New Mexico. Montana and Wyoming alone had a larger wool-clip in 1902, Idaho's clip being 21,639,387 pounds—more than 5 per cent. increase over 1901. Idaho had in 1902 416,171 head of cattle, valued at \$9,814,483; 148,279 horses, valued at \$4,988,597; and 119,611 swine, valued at \$901,867. The State horticultural inspector reported that Idaho was making great progress in fruit growing. In 1902 fruit products exceeded a million dollars in value.

The Coeur d'Alene mining district in Idaho showed an increase in production for 1902, notwithstanding the limitations on output imposed by the action of the American Smelting and Refining Company. Reports showed an output of 75,200 short tons of lead and 3,569,263 ounces of silver. In 1901 the full output of the district was 68,953 short tons of lead and 4,282,388 ounces of silver. Owing to the restriction of product but little new work was done beyond the ordinary prospecting and development necessary to keep the mills supplied. An important feature of the mining development in Idaho, as elsewhere, during 1902 was the substitution of electric power generated by water-motors for pumping and the hoisting and hauling of ores from the mines. Idaho has had no coal mines, but in 1902 coal was discovered and mines opened in several counties. See COPPER and GOLD.

Conventions and Platforms.—The Republican State convention was held at Boise August 21, 1902. Protection and the trusts were the two principal planks in the platform. It favored such a revision of the tariff, "without unreasonable delay," as would "place upon the free list every article and product controlled by any monopoly, and such other articles and products as are beyond the need of protection." The

platform suggested an amendment to the Constitution to enable Congress to "effectually regulate and suppress all trusts and injurious combinations for aggregations of capital."

The Democratic State convention was held at Boise City, September 5, 1902. The usual declarations embodying the principles of the Kansas City platform were repeated. Protests were made against "imperialism" and the carrying on of a colonial policy. Trusts and protective tariffs were condemned. Legislation was advocated to prevent "the abridgment, by the abuse of a writ of injunction, of the right of free speech, the peaceable assemblage of all persons to peaceably discuss any and all questions, the right to use persuasion to convert others to their views, and the depriving of persons of trial by jury." Demand was made for the government ownership of railway, telegraph, and telephone lines. The election of United States senators by direct vote of the people was strongly advocated, as were also the adoption of the initiative and referendum and legislation giving married women equal property rights with men.

Elections.—At the regular biennial State elections, held November 4, 1902, a full Republican State ticket was elected. The vote for governor was, Morrison (Rep.), 31,874; Hunt (Dem.), 26,021; giving Morrison 5853 plurality. The legislature for 1903 will consist of 6 Fusionists and 15 Republicans in the senate, and 11 Fusionists and 35 Republicans in the house.

Other Events.—The lands of the ceded Fort Hall reservation were thrown open to settlement June 17, 1902, and 1300 persons proceeded to take up homesteads on the lands. There was consummated at Salt Lake City on November 29 a deal through which 271,000 acres along the Snake River in Idaho are to be redeemed by irrigation. The scheme of the company organized to accomplish this includes the building of two great canals, the development of the power at Shoshone Falls, and the building of an electric railroad to connect with the Oregon Shore Line at Shoshone. The principal shareholder is F. H. Buhl, of Sharon, Pa., and the capital invested is stated at \$1,500,000.

State Officers.—For 1902: Governor, Frank W. Hunt (Dem.); lieutenant-governor, Thomas F. Terrell (Dem.); secretary of state, C. J. Bassett (Dem.); treasurer, John J. Plumer (Dem.); auditor, Egbert W. Jones (Pop.); attorney-general, Frank Martin (Dem.); superintendent of education, Permeal French (Dem.); inspector of mines, Martin H. Jacobs (Pop.) For 1903: Governor, John T. Morrison (elected for two years, term ending January, 1905); lieutenant-governor, James M. Stevens; secretary of state, Wilmot H. Gibson; treasurer, Henry N. Coffin; auditor, Theo. Turner; attorney-general, John A. Bagley; superintendent of education, May L. Scott; inspector of mines, Robert Bell—all Republicans.

Supreme Court: Chief-Justice, Ralph P. Quarles (Dem.); associate justices, Isaac N. Sullivan (Rep.); Charles O. Stockbridge (Dem.).

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

ILLINOIS, a central State of the United States, has an area of 56,650 square miles. The capital is Springfield. Illinois was organized as a Territory March 1, 1809, and admitted as a State December 3, 1818. The population in 1900 was 4,821,550, while in June, 1902, as estimated by the government actuary, it was 5,033,000. The populations of the largest cities in 1900 were: Chicago, second largest city in the United States, 1,698,575, an increase of 598,725 since 1890; Peoria, 56,100; Quincy, 36,252; and Springfield, 34,159.

Finance.—The funds of the State treasury of Illinois on October 1, 1900, amounted to \$2,617,955.88. The total receipts during the biennial period from October 1, 1900, to October 1, 1902, were \$16,382,020.34, and the disbursements \$15,621,652.19, leaving a balance on September 30, 1902, of \$3,378,324.03. Of the receipts for the term \$12,151,242.17 were from the revenue fund; \$2,083,619.02 from the school fund; \$2,136,552.57 from the local bond fund; and \$10,606.58 from the State game protection fund. Of the general revenue fund, \$2,881,902.56 were derived from taxes for 1900; \$3,387,414.21 from the tax of 1901; \$1,695,773.85 from the 7 per cent. tax of the gross receipts of the Illinois Central; \$532,877.90 from fees received by the secretary of State; \$604,593.86 from insurance taxes, and \$1,005,129.29 from the United States government on account of expenditures incurred during the Civil War. Of the State school revenues, \$2,083,619.02 were on account of taxes of 1899, 1900, and 1901. At the end of the term the principal of the bonded debt of the State was \$18,500, and this principal represented bonds called in and drawing no further interest.

Agriculture and Industries.—The year 1902 was one of unprecedented prosperity in all branches of industry in Illinois. Farm, mine, and factory reported both large production and high prices. In 1902, Illinois was the first State in the production and value of farm produce. In that year the total value of all farm crops of the State, according to the *Crop Reporter*, was \$241,263,406—30 per cent. greater

than that of any other State and exceeding the value of the aggregate crops of the six New England States and the eleven States and Territories west of Kansas. In the production of corn and oats, the two principal crops, Illinois was equaled by no other State. The following table gives the acreage and production of the principal crops:

CROPS.	Acres.	Bushels.	Value.
Corn	9,623,680	372,436,416	\$ 134,077,110
Oats	4,070,303	153,450,423	42,966,118
Hay	2,747,369	4,121,054*	36,553,749
Wheat	1,821,337	32,601,992	19,235,140
Potatoes	146,245	17,262,810	7,250,380

* Tons.

The value of both barley and rye produced was \$1,000,000. On December 31, 1902, Illinois was surpassed in total value of farm animals only by Iowa. The statistics given by the *Crop Reporter* were 1,077,188 horses, value \$84,583,390; 107,699 mules, \$9,034,795; 985,769 milch cows, \$34,817,361; 1,700,716 other cattle, \$45,054,861; 988,174 sheep, \$3,792,909; 3,747,495 swine, \$35,338,878.

Live-stock receipts at Chicago fell off greatly in 1902, though shipments of sheep increased. Freight receipts by water were greater at Chicago than at any other Lake port, amounting to 6,664,117 tons during the open season. Bank clearings for Chicago during the calendar years 1901 and 1902 were \$7,756,372,450 and \$8,394,872,346, respectively—a greater increase than was shown by any other city of the country.

Illinois easily maintained second place in the production of coal for 1902. There was unusual activity in mining, on account of the coal shortage due to the strike of the anthracite coal miners in Pennsylvania. No labor disturbances of any importance were experienced in the Illinois mines. The Illinois Bureau of Labor Statistics reported 332 shipping mines on July 1. The total output for the year ending June 30, 1902, was 30,021,300 short tons. (For production by calendar years, see COAL.) The total value of the output at the mines was \$28,072,050. The mines were in active operation for an average of 210.2 days during the year. The quantity mined was, by machines, 6,647,087 tons; by hand, 23,374,214 tons. The total number of employees was 13,130. The average price paid for hand mining was \$0.5635 per gross ton. Only Pennsylvania and Ohio exceeded Illinois in the manufacture of iron and steel. The production of pig-iron increased from 1,596,850 tons in 1901 to 1,730,220 tons in 1902. The volume of business in the iron and steel trades, both wholesale and retail, was 25 per cent. more in 1902 than in 1901, and the increase would have been even greater if the railroads could have handled all the freight offered. The activity in the manufacture of locomotives and railroad equipments was especially marked, because of the great demand for increased transport facilities.

Railroads.—The total length of steam railroads in the State of Illinois in 1901 was 17,351.2 miles, an increase of 571.92 miles over 1900. The mileage of surface and elevated electric lines reported for 1901 was 218.99 miles as against 149.68 miles for 1900. The capital of all steam railroad corporations doing business in the State on June 30, 1901, was \$3,140,822,020, which is an increase of \$72,122,991 over the previous year. The capital stock of elevated and surface lines on the same date was \$88,595,450—an increase of \$5,528,150 for the year, a very remarkable showing. The gross earnings from operation of all steam roads entering the State was, for the year ending June 30, 1901, \$519,391,409, which was \$36,847,830 more than the gross earnings for 1900. The total income of steam railroads operating in the State for 1901 was \$114,677,806, an increase over the previous year of \$6,871,654.

Taxation Reform.—The movement to increase the assessments of public utility corporations called forth loud complaints of confiscation from the corporations. The Union Traction Company, operating the street railways in the north and west divisions of Chicago, reported a deficit for the fiscal year ending June 30, 1902, as against a small surplus for 1901. President Roach in his report said: "The financial statement will show that prospective profits have been taxed into a deficit." In that, the receipts of the Union Traction Company from operation in the year 1901-02 were \$7,825,000. The expenses for maintenance and operation were \$4,570,000, leaving net earnings from operation for the year \$3,254,000. The taxes paid, to which President Roach lays the blame for the deficit, amounted to \$683,000. This would leave \$2,500,000 applicable to payments on account of investment—a very handsome income on a reasonable capitalization. The alleged deficit appears as the result of a complicated system of accounting whereby dividends on the stock of constituent companies (which often amount to 30 or 35 per cent. per annum, on stock consisting mostly of water) are made to appear as fixed charges. The Union

Traction Company is capitalized at over \$250,000 per mile of single track, while the City Railway Company, operating in the south division of the city with a much more valuable plant, has a capitalization of only \$90,000 per mile.

Conventions and Platforms.—The Republican State convention was held at Springfield on May 8, 1902. In the platform, the sentiments expressed in the platform of 1900 were reaffirmed. The national and State administrations were heartily endorsed, and the candidacy of Representative Albert F. Hopkins for the Senate was approved. The platform referred in terms of great praise to the services of the army and navy, and urged liberal pensions to those discharged from service. Reciprocity with Cuba was recommended, the protective tariff was upheld, and trusts of all kinds were condemned unsparingly. State legislation to reduce the competition of convict with free labor was insisted upon.

The Democratic State convention was held at Springfield on June 17, 1902. In addition to the reaffirmation of the regular Democratic principles as set forth largely in the Kansas City platform, the convention expressed its deep regret at "the monstrous crime which removed from the nation its much loved and mourned President, William McKinley." The platform, in this connection, condemns all resorts to violence for redress of grievances, real or fancied. Concerning the administration policy in the Philippines, it was declared that "the American government should at once announce to the Filipinos that it is not our policy to permanently retain their country, but as soon as hostilities shall cease and a stable government be established the United States will recognize the independence of the Philippine Islands, as was done in the case of Cuba." The Republican tariff was denounced as "a prolific mother of trusts," and a thorough revision was demanded, together with the abolition of all special privileges. On the trust question, the platform declared that private monopolies destroyed competition and controlled the price of material, labor and finished product, "thereby robbing both producer and consumer." Rigid enforcement of the anti-trust laws and the supplementing of such laws were urged. The Ship Subsidy bill was denounced. Home rule for municipalities in the matter of granting franchises, and the taxing of corporations, also the application of civil service laws in State institutions were declared to be necessary. The abolition of convict labor was asked for.

The platform of the People's party reaffirmed the principles set forth in the Omaha platform, and, later, the Cincinnati platform. The Louisville convention was endorsed, "as a means of looking to the co-operation of all reforms." The main plank of the platform invites the "full, free co-operation of all who are opposed to monopoly of the natural sources of wealth and have the good of mankind and the perpetuity of the American government at heart. We favor the initiative and referendum and imperative mandate as the only means whereby the people can freely and fully express themselves on all political questions, and as the open door through which all other reforms can be brought about. We favor practical, clear-cut legislation in the interest of labor, including the following specific enactments: A law to prevent blacklisting of employees by corporations; a law to prohibit the use of convict labor in competition with free labor."

Strikes and Labor Movements.—The members of the Coal Teamsters' Union were ordered on January 28, 1902, not to deliver coal to any building using that fuel in cold weather only; those to whom coal was to be delivered must be such as use it all the year round. A number of firms were visited by representatives of the union and induced to give up the use of fuel-gas. The large packing houses of the Western cities having, in April, advanced the price of dressed meats, giving as excuses the shortage of suitable cattle owing to the drought of 1901, the increased consumption at home and increased exports, the retail dealers in Chicago also advanced prices. In May, the Chicago packers were called into court and were temporarily enjoined by Judge Grosscup, under the provisions of the anti-trust law. Later in the month the teamsters employed by these packers struck, demanding their share of the increased profits. This led to the use of department store wagons to haul meat, and when two drivers were discharged for refusing, all struck. Rioting accompanied the strike, and on June 2 there were conflicts between the police and the packing-house strikers. The governor and the State board of arbitration restored peace on June 5, 1902. The packers agreed to advance wages, but refused to recognize the Teamsters' Union. The strike of the Chicago freight handlers, which began on June 7, 1902, terminated in July. A threatened sympathetic strike by the teamsters was averted by the refusal of their union officers to sanction the strike. The freight handlers returned to work on the terms offered at the beginning of the controversy by the railroad managers. The chief dispute was over the pay of truckers, the union demanding 18 cents an hour in the first instance, then receding to 17½ cents an hour. The railroad managers declined to grant more than 17 cents, and carried their point. On November 7, 3500 employees of the Union

Traction Company of Chicago were awarded 10 per cent. increase in their wages by arbitrators, the same to continue till May, 1904.

Legal Decisions.—Judge Tuley, of Chicago, early in January, 1902, granted a preliminary injunction restraining the Chicago Telephone Company from charging more than the franchise rate of \$125 a year for its business service. Judge Grosscup, of the United States Court, decided on January 15, 1902, that Chicago has the right to regulate the price of gas. Judge Tuley, on January 31, 1902, ordered a receivership for the Lion Lace Industry, managed by Alexander Dowie, head of the Christian Catholic Church. A suit against Dowie had been brought by his brother-in-law, Samuel Stevenson, who had made over the business, but who claimed that undue influence was exerted. Judge Tuley decided that Stevenson was entitled to \$100,000 or to its equivalent, the business itself. For Illinois trust case decision, see article TRUSTS.

Elections.—At the regular biennial State election held on November 4, 1902, the only officers voted for were treasurer and superintendent of public instruction. The vote for State treasurer was Busse (Rep.), 450,695; Duddleston (Dem.), 360,925. The State legislature for 1903 will consist of 36 Republicans and 15 Democrats in the senate and 80 Republicans, 62 Democrats, 1 Prohibition, and 2 People's party in the house. A very interesting feature of the election was the expression of opinion by the voters upon three questions of great political significance. A petition signed by more than 100,000 voters, secured the submission of these important questions, which were briefly: (1) Whether the voters favored a referendum upon acts of the legislature whenever 5 per cent. of their number petitioned for it, and a referendum upon proposed legislation whenever 8 per cent. of their number petitioned; (2) whether the voters desired a corresponding referendum upon measures adopted by or proposed to city councils and other local governing bodies; (3) whether the voters desired popular election of United States senators. The great majority of legislative candidates bound themselves to carry out the wishes of the voters as expressed in the result of the election, though the vote was merely an expression of opinion and not a legislative mandate. Notwithstanding the clumsy wording of the initiative and referendum propositions, the vote on them was about 428,000 for and 87,000 against. The third proposition was carried by about the same majority.

Other Events.—Early in January, 1902, the American Stove Company, with a capital of \$5,000,000, was organized in Chicago. This new corporation was made up of nine constituent companies, manufacturing gas, gasoline, and oil stoves. In March was completed the organization of the National Millers' Federation at Chicago, which includes the National Millers' Association and the National Winter Wheat Millers' Association. The total capitalization of the new corporation is \$400,000,000, and the annual output of their mills is about 100,000,000 barrels. In the latter part of April the Deering Harvester Company of Chicago announced that it was about to build large steel mills in South Chicago, and had secured one of the richest ore mines in the Mesaba range. The intention was to make itself independent of the United States Steel Trust in the manufacture of its raw and finished product. Later on, the Deering Harvester Company, with all its plants and mines, was absorbed in the International Harvester Corporation, a newly organized trust with an authorized capital of \$65,000,000.

State Officers.—For 1902 and 1903: Governor, Richard Yates, elected for four years, term ending January, 1905; lieutenant-governor, W. A. Northcott; secretary of state, James A. Rose; treasurer, M. O. Williamson (in 1902), and Fred A. Busse, term two years, 1903-05; auditor, J. S. McCullough; superintendent of public instruction, Alfred Bayliss, term four years, 1903-07; attorney-general, H. J. Hamlin; superintendent of insurance (appointed), Henry Yates—all Republicans.

Supreme Court: For 1902 and 1903: Chief justice for year ending June, 1902, Jacob W. Wilkin; chief justice for following year, Benjamin D. Magruder (Rep.); associate justices, Carroll C. Boggs (Dem.), James B. Ricks (Dem.), Joseph N. Carter (Rep.), John P. Hand (Rep.), James H. Cartwright (Rep.), Benjamin D. Magruder (before June, 1902), and Jacob W. Wilkin (Dem.) (after June, 1902).

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

ILLINOIS, UNIVERSITY OF, at Champaign and Urbana, Ill., opened 1868. The total student enrollment for 1902 was 3221, excluding duplicates, and the faculty numbered 297. The gross income for the year was \$778,789. The library contains 60,000 volumes. The most important addition to the curriculum was the opening of the School of Commerce. The special feature of this new department is its book equipment, which includes a number of complete sets of importance in French, German, and English. The new hydraulic laboratory was opened, the new classical laboratory was taken into use, and the new law school was moved into the old chemical building.

IMMIGRATION. The report of the commissioner-general of immigration shows that the total ascertained alien immigration to the United States in the fiscal year ending June 30, 1902, was 730,798. Of this number 82,055 were cabin passengers and 648,743 (the largest number ever recorded) were steerage passengers. As compared with the previous year, the cabin passengers showed an increase of 7105, and the steerage aliens of 160,825, or a total of 167,930. The increasing preponderance of male over female immigrants (steerage), which became noticeable in 1900, when the proportion of 3 males to 2 females changed to 2 males for every female, became still more marked in 1902, when the proportion was nearly 5 males to 2 females. Of the steerage aliens in 1902, 77,355 brought over \$30 each, and 413,705 brought less than \$30 each. Those who could read but not write numbered 2917, while 162,188 could neither read nor write, and 483,638 could both read and write. Since 74,063 of the aliens were under fourteen years of age, it may be seen of how little avail would be the legislation proposed in Congress in 1902, in accordance with the President's general recommendation, establishing a reading test for immigrants, but releasing therefrom children under fifteen and adults over fifty. A more effective test, if the proper administrative rules could be framed, would probably be that also recommended by the President—examining the immigrant as to his ability to earn a fair living in accordance with American standards, and to comprehend and fit into American political institutions. Such a test would seem especially important for the reason that aliens tend to congregate in the urban centres and there form little separate national colonies of their own, and for the further reason that the preponderating characteristics of the immigrants are essentially un-American; as is instanced by the fact that in 1902 more than 70 per cent. of the steerage immigration was from Italy, Austria-Hungary, and Russia. The countries sending the largest number of steerage immigrants to the United States in 1902 were: Italy, including Sicily and Sardinia, 178,375, an increase over the year previous of 42,379; Austria-Hungary, 171,989, an increase of 58,599; Russia, including Finland, 107,347, an increase of 22,090; Sweden, 30,894, an increase of 7563; Ireland, 29,138, a decrease of 1423; the German empire, 28,304, an increase of 6633; Norway, 17,484, an increase of 5236; and Japan, 14,270, an increase of 9001.

Of the more than forty races that contributed to the alien steerage immigration in 1902, ten contributed 85 per cent. These ten races were the same, though in slightly different order, that in 1901 contributed 86 per cent. of the immigration. In both years the Italians maintained the lead at 28 per cent., having more than double the number of immigrants sent by any other nation. The ten races most largely represented in each year, and the percentage of the total immigration which they furnished, is shown in the subjoined table:

RACE.	Number in 1901.	Percentage in 1901.	Number in 1902.	Percentage in 1902.
Italian.....	137,807	28	180,535	28
Polish.....	43,617	9	69,320	11
Jewish.....	58,098	12	57,888	9
Scandinavian.....	40,277	8	55,780	8
German.....	34,742	7	51,886	8
Slovak.....	29,343	6	36,934	6
Croatian and Slovenian.....	17,928	3	30,283	5
Irish.....	30,404	6	29,001	4
Magyar.....	13,311	3	23,610	4
English.....	13,488	3	14,942	2
All others.....	68,903	14	98,714	15
Total.....	487,918	100	648,743	100

As regards destination, 203,824 immigrants, or nearly one-third of the whole number, were bound for New York, 139,096 were going to Pennsylvania, 50,939 to Massachusetts, 45,845 to Illinois, 29,038 to New Jersey, 25,995 to Ohio, 16,835 to Connecticut, 15,093 to California, 14,758 to Michigan, and 13,984 to Minnesota. The very limited distribution shown by these figures, indicates the danger of allowing immigration to continue unregulated. It is evident that concentrated alien populations grouped into distinct racial communities cannot be assimilated and Americanized.

IMMUNITY. See SERUM THERAPY.

IMPERIAL SERVICE ORDER, instituted in London in June, 1902, by King Edward VII., consists of a sovereign and companions. The number of companions is unlimited, but the order is only conferred for long and meritorious services and practically is confined to persons who have been employed in the various branches of the British civil service and who have served at least forty years. It has as yet been conferred on only about one hundred and five gentlemen.

INDIA, BRITISH, comprises all that part of the Hindustan Peninsula and of Burma (*q.v.*), which is directly or indirectly under British rule, but in a popular sense includes also certain other states, as Nepal (*q.v.*), which are beyond its borders, but are under the control or protection of the governor-general of British India.

Area and Population.—The total area of the British Indian empire is 1,560,160 square miles, of which 655,695 square miles are included in the native states. According to the census of 1901 the population of British India proper was 231,085,132, and of the Native States 63,181,569, or a total for all the British possessions of 294,266,701. The net increase in population for the decade 1891-1901 was 4,283,069, or 1.49 per cent, as compared with an increase of 11.2 per cent. in the decade 1881-91. The populations of the largest cities in 1901 were: Calcutta, 1,121,664; Bombay, 770,843; Madras, 509,397; Hyderabad, 446,291; Lucknow, 263,951; Rangoon (Burma), 232,326; Delhi, 208,385; and Benares, 203,095. Ethnically the principal racial elements in India are, in the order of their size, the Aryo-Indian, the Dravidian, the Tibeto-Burman, the Kolarian, and the Aryo-Iranian. The languages and dialects spoken number in all 118, of which 20 are used by more than a million each. According to religious belief, the population (1901) was divided as follows: Hindus, 207,146,422; Mohammedans, 62,458,061; Buddhists, 9,476,750; Christians, 2,923,241 (in 1891, 2,284,380). The total for the Hindu faith is the only one to show a decrease for the decade. In 1900 the enrollment in the 150,569 colleges and schools, public and private, was 4,462,844, of whom 20,744 were enrolled in 171 colleges. Three-quarters of the institutions are maintained or aided by the state. The expenditure of the British Indian government for education in 1902 was estimated at £1,126,000. At the head of the Indian educational system stand the five universities of Calcutta, Madras, Bombay, Punjab, and Allahabad, which are merely examining bodies, having each numerous affiliated colleges. The total number of matriculates in 1900 numbered 7519.

Government.—The administration of the British Indian empire in England is entrusted to a secretary of state for India, a cabinet minister responsible to Parliament, who is assisted by a council of not less than ten members, whose principal duty is to control the Indian budget. The supreme executive authority in India is vested in the governor-general (or viceroy) in council. The governor-general's council consists, for executive purposes, of five ordinary members, and the commander-in-chief of the forces in India, and for legislative purposes is expanded by sixteen additional members appointed by the viceroy. The enlarged council has power, subject to certain restrictions, to make all the laws for British India proper, and for British subjects within the Native States. For purposes of administration that part of India directly under British control is divided into nine principal provinces, each under a governor, a lieutenant-governor, or a chief commissioner, and several minor charges or districts. The provinces are Madras, Bombay, Bengal, the United Provinces of Agra and Oudh (formerly called Northwestern Provinces and Oudh), Burma (*q.v.*), the Punjab, Assam, the Central Provinces, and the new North-West Frontier Province, constituted in November, 1901. The governors of Madras and Bombay, who are appointed by the crown, are assisted by executive and legislative councils. The unit of administration within the province is the district, and each district is in charge of a deputy commissioner or collector, whose duties are executive, magisterial, and fiscal. The present governor-general is Lord Curzon of Kedleston, who succeeded the Earl of Elgin in 1898.

The nature and extent of British control in the Native States, which comprise over one-third of the area of the Indian empire, varies greatly, and is usually exercised through a government resident or agent, who advises and assists the native princes. The princes manage their own internal affairs, but have no power to make peace or war, and can maintain only a limited army. Some, but not all of them, pay tribute to the government, which controls all their external relations.

The Indian army is composed of both British and native troops. The commander-in-chief (General Lord Kitchener of Khartoum since 1902) has a seat in the viceroy's council. The establishment consists (1902) of 228,887 officers and men, of whom 73,638 are British troops and 155,249 native troops with European officers.

Finance.—The revenue of the Indian government is largely derived from land revenue or rental, opium and salt duties, stamp taxes, excise, and customs. The expenditure is incurred principally for railways and public works, administration, defense, pensions, and interest on the debt. The total revenue for the fiscal year ending March 31, 1901, amounted to £75,272,000, and for 1902 £76,547,000. The expenditures for the same periods were £73,602,000 and £71,874,000, respectively, showing an increase in the surplus from £1,861,000 in 1901 to £4,673,000 in 1902. The principal items of revenue in 1902 were: Railways, £20,178,000; land, £18,470,000; salt, £5,997,000; opium, £4,854,000, and excise, £4,086,000. The principal items of expenditure were: Railways, £19,360,000; defense, £16,129,000; departmental services, £11,164,000; irrigation and other public works, £6,811,000. The expenditure for

famine relief which in 1901 amounted to £4,125,000, in 1902 was only £556,000. The Indian debt amounts to £220,009,000. The value of the Indian silver rupee has been fixed since 1868 at 1s. 4d. (32.4 cents), or 15 rupees to the pound sterling.

Industries.—About 85 per cent. of the population of India is engaged in agriculture. The state owns the land and lets it out at a fixed annual rental. Rice, wheat, and other cereals, cotton, jute, tea, tobacco, opium, sugar-cane, indigo, and oil-seeds, are the principal products. The acreage of the chief crops in 1900 was: Rice, 72,808,952 acres; wheat, 16,104,779; other grains, 75,965,064; sugar-cane, 2,693,029; cotton, 8,375,841, and oil seeds, 10,327,641. The state forest reserves in 1900 covered 87,000 square miles. The principal manufactures are textiles, pottery and metal goods, the total manufacturing population being estimated at 20,000,000. The output of 286 collieries worked in 1900 amounted to 6,118,692 tons, and the mines, although very little developed, employed 89,188.

Commerce.—The commerce of India, in spite of the prevalence of famine and other adverse conditions, has increased enormously in the past few years. The value of the imports and exports for the past three fiscal years has been as follows:

	1899-1900	1900-01	1901-02
Imports	£64,186,000	£70,314,000	£73,076,000
Exports.....	78,026,000	81,328,000	90,664,000

The principal imports (1901-02) were cotton goods and yarns, £21,930,000; metals, £4,600,000; sugar, £3,901,000; mineral-oil, £2,558,000, and machinery, £2,004,000. The leading imports were seeds, £11,186,000; raw cotton, £9,617,000; rice, £9,280,000; raw jute, £7,865,000; cotton yarns and cloth, £7,244,000; jute manufactures, £5,808,000; opium, £5,682,000; and tea, £5,430,000. In the order of the value of their sea-borne trade, the countries having commercial relations in 1901-02 stood: Great Britain, China, Germany, France, and the United States. The value of the frontier land-trade amounted in 1901-02 to a total of £9,575,000 for both imports and exports.

Communications.—The number of miles of railway open for traffic on March 31, 1902, was 25,529, of which 460 miles were opened in 1901-02. In addition, the construction of 2284 miles has been sanctioned. The capital outlay on all the Indian railways on January 1, 1902, amounted to £219,483,000, and the expenditure for the year 1901-02 was £6,658,000. The net gain to the state, above expenditures, amounted in 1901-02 to £818,000, as compared with £325,000 in 1900-01. About two-thirds of the total length of railways in operation is owned by the state and operated either by the government or by private companies. The remainder of the lines are owned and worked by private corporations or native states.

HISTORY.

The Durbar at Delhi.—In the closing days of the year 1902 and extending over into 1903, the ceremonies and festivities attending the proclamation of the coronation of Edward VII. as king-emperor took place at a durbar (convocation) of the native princes of the British Indian empire. The Duke and Duchess of Connaught, the special representatives of the king and queen, landed at Bombay on December 27, and on the 29th, with Lord Curzon, the viceroy, made their state entrance into the city of Delhi. The Durbar itself took place on January 1, 1903, the viceroy and the royal representatives occupying thrones on a raised dais in the centre of a horseshoe-shaped amphitheatre, about which were seated 15,000 spectators. A force of 40,000 troops under the personal command of Lord Kitchener was drawn up in the arena. There, amid scenes of oriental splendor and display probably never equaled in modern times, the native princes paid homage to the viceroy and swore renewed allegiance to the emperor of India. After an eloquent address from Lord Curzon in which he delivered to the assembled princes the royal message declaring the hope that he might be permitted to secure to them as humane and equitable an administration as that of his mother, Queen Victoria, a long list of honors was announced.

The Northwestern Disturbances.—Operations against the Mahsud and Waziri tribes on the northwestern Indian frontier continued during the greater part of 1902, in spite of the fact that at the beginning of the year it was thought the trouble was practically ended. The policy of a strict blockade of the region which had prevailed since 1900 was then abandoned for a more active policy, consisting of a series of sharp rallies or raids for a period of a few days' duration by a force of 1000 or 2000 men. The effect of this new policy was so successful that in March, 1902, the chief commissioner of the North-West Frontier Province was able to report that he believed that the settlement of the difficulty as far as the Mahsuds were concerned was assured. The Waziris, however, continued to make trouble, and late in November necessitated the inauguration of a more active campaign against them. This resulted

ELEPHANT PROCESSION AT THE DELHI DURBAR

in considerable fighting and in the loss of a number of British troops, including Colonel Tonnochy and Captain White of the Third Sikh Regiment, who were killed in an assault on a stubbornly defended stone tower.

Other Matters.—The number on famine relief was somewhat larger through the year than in 1901, but conditions were reported as being much improved and the situation was not considered as serious as it has been for several years past. The number on relief averaged between 300,000 and 400,000 during the greater part of the year. An agreement was reached during the year between the imperial government and the India Office by which it was arranged that in the future the cost of Indian troops serving outside the country should be borne jointly by the British and the Indian government.

INDIA, FRENCH, the possessions of France in East India, comprising five geographically separate districts or *dépendances*, united under one colonial government for administrative purposes. The divisions are Chandernagore, an inland town, 17 miles north of Calcutta, on the Hoogly River, completely surrounded by British territory; Yanaon, on the eastern coast of British India, north of Madras; Pondicherry and Karikal, two districts on the east coast south of Madras, and Mahé, on the west coast. The total area is about 205 square miles, and the population in 1901 was 275,094, of whom only 1000 were Europeans. The most important settlement, Pondicherry, where the seat of the colonial government is located, has an area of 115 square miles and a population of 182,000. The colony is administered by a governor, assisted by an elective council, and is represented by a senator and a deputy in the French parliament. The local revenue and expenditure amounted in 1901 to Rs. 1,225,000 (1 rupee equals 32 1/2 cents), and the expenditure of France for the colony (budget of 1902) was 473,009 francs. The total imports in 1901 were valued at 3,793,000 francs, and the exports, chiefly ground-nuts and oil-seeds, at 22,253,000 francs. There are 23 miles of railway in operation, connecting Pondicherry and Karikal with the South Indian system.

INDIA, PORTUGUESE, consists of Gôa, on the Malabar, or western, coast of India, 265 miles south of Bombay; Damao, a small coast territory north of Bombay; and Diu, a small island off the Guzerat coast. Gôa, the most important division of the colony, has an area of 1080 square miles, and had, in 1891, a population of 561,384. Its estimated revenue (1901-02) was 1,019,868 milreis, and its expenditure, 1,028,420 milreis. The annual production of salt in Gôa amounts to about 12,500 tons. Hemp, grain, pulse, and betel-nuts are also raised. In 1900 the imports by sea and land amounted to Rs. 5,483,924, the exports to Rs. 1,562,287, and the British Indian transit trade to Rs. 5,719,122. There is a railway 51 miles in length connecting Gôa with the Indian railway system. Damao has an area of 384 square miles and a population of 63,284, and Diu, an area of 52 square miles and a population of 12,758.

INDIANA, an east central State of the United States, has an area of 36,350 square miles. The capital is Indianapolis. Indiana was organized as a Territory July 4, 1800; admitted as a State December 11, 1816. The population in 1900 was 2,516,462; in June, 1902, as estimated by the government actuary, it was 2,586,000. The populations of the largest cities in 1900 were: Indianapolis, 169,164; Evansville, 59,007; Fort Wayne, 45,115; Terre Haute, 36,673.

Finance.—The receipts of the treasury for the year ending October 31, 1901, were \$7,358,140.84, the expenditure \$7,129,493, and the balance in the treasury \$642,292.32. The State debt on January 1, 1902, was \$4,204,615.12, all of which was bonded. The debt was reduced \$500,000 during the year 1901. No figures for the year 1902 are available.

Agriculture and Industries.—Conditions were favorable to agriculture in 1902. All cereals except wheat showed an increase of acreage in the period 1899-1902, according to comparisons of the census figures and the Agricultural Department's figures. If the figures are to be relied on, the acreage of wheat decreased from 2,893,293 acres to 2,217,718 acres in that period. The yield of wheat for 1902 was 35,484,448 bushels, valued at \$24,129,425. The acreage of corn in 1902 was 4,520,637 acres, and the total yield 171,332,142 bushels, valued at \$61,679,571—an amount nearly equal to the value of all other crops combined. Of oats there were 1,371,912 acres under crop, as against 1,017,385 acres in 1899. The yield for 1902 was larger than for several preceding seasons, being estimated at 48,565,685 bushels, valued at \$13,598,392. The hay crop reached 2,635,215 tons, cut from 1,804,942 acres, and was valued at \$22,847,314. The value of the potato crop was \$3,431,233. The *American Grocer* states that more tomatoes were packed in Indiana during 1902 than in any other State except Maryland, and estimated the output at 992,686 cases of two dozen tins each. The report of the Department of Agriculture, January 1, 1903, showed 649,158 horses, valued at \$47,824,869; 1,472,562 cattle, \$38,783,980; 1,355,436

sheep, \$4,667,308; and 2,712,397 swine, \$22,349,327. The wool clip in 1902 was 5,395,320 pounds, which was about a 4 per cent. increase over the clip in 1901.

There was a large increase in coal mining during 1902, both in the number of mines in operation and in output. Large investments were made in coal lands. This was due to two causes, first, the coal strike in Pennsylvania, and, secondly, the failure of natural gas in supplying fuel for the manufactories situated in the gas belt. The year's production of coal was estimated at 8,357,417 tons, an increase of more than 1,000,000 tons over 1901. The output was somewhat curtailed by the inability of the railroads to handle the coal. The construction of a number of steam and electric railroads to tap the coal regions was begun or actively pushed during the year. Practically no labor troubles were experienced in the mining regions, the agreement between operators and men being faithfully observed. In 1901-02 the State labor commission adjusted 42 labor controversies involving 202 firms and 10,000 employees.

Conventions and Platforms.—The Republican State convention was held at Indianapolis on April 24, 1902. It was the first political convention to meet in any State during the year, and was looked forward to with interest, as likely to be indicative of Republican sentiment throughout the Union. Senator Beveridge, permanent chairman of the convention, sounded the keynote of the Republican programme in his opening address, in which he emphasized the necessity of securing foreign markets for American products. The principles of the national platform of 1900 were reaffirmed by the convention, and the administration was endorsed. The platform favored the most stringent national and State legislation to suppress anarchy. It advocated just and liberal reciprocal relations between the United States and Cuba. The administration policy in the Philippines was approved, emphasis being laid on the necessity for giving the people of the islands increased participation in the administration of their domestic affairs when they shall have proved themselves capable of self-government. The policy of protection was endorsed with this proviso: "While we favor such modification of tariff schedules as from time to time are required by changing conditions, we insist that such changes shall be made in line with the fundamental principle of protection." Combinations of capital prejudicial to competition were denounced. The construction of an isthmian canal was advocated, also the exercise of a liberal pension policy, Chinese exclusion, and the exclusion of all undesirable immigrants.

The Democratic State convention was held at Indianapolis, June 4, 1902. The principal question at issue was the reaffirmation of the Kansas City platform of 1900. There was strong opposition to such a course, and in the end its opponents carried the day. In the platform ultimately adopted bimetalism was ignored, except in the shape of a resolution declaring that the increased supply of money, arising from the doubled production of gold, had brought a rise in prices and revival of industry, which demonstrated the truth of the bimetallic theory. The Dingley tariff was denounced as the "breeder of trusts," and a demand was made that tariff duties be levied for the purposes of revenue only. The Philippine policy of the administration was condemned in unequivocal terms. The platform favored the election of United States senators by popular vote. The ship subsidy bill was condemned, also the attitude of the Republican party in refusing to give the Interstate Commerce Commission power to enforce its decisions against discriminations in railroad rates. The construction and control of an isthmian canal was approved.

Elections.—At the regular biennial State elections, held November 4, 1902, the following officers were voted for: Secretary of state, auditor, treasurer, and attorney-general. The vote for secretary of state was, Storms (Rep.), 208,819, and Schoonover (Dem.), 263,555. The State legislature for 1903 will be composed of 33 Republicans and 17 Democrats in the senate, and 61 Republicans and 39 Democrats in the house.

State Officers.—For 1902 and 1903: Governor, Winfield T. Durbin, elected for four years, term ending January, 1905; lieutenant-governor, N. W. Gilbert; secretary of state, D. E. Storms; treasurer, Leopold Levy in 1902, and N. U. Hill in 1903; auditor and commissioner of insurance, David E. Sherrick; attorney-general, W. L. Taylor in 1902 and Charles W. Miller in 1903; superintendent of education, Frank L. Jones in 1902, and F. A. Cotton in 1903—all Republicans.

Supreme Court for 1902 and 1903: Chief justice, John V. Hadley; associate justices, Leander J. Monks, John H. Gillett, James H. Jordan, and Alexander Dowling—all Republicans. For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

INDIANA UNIVERSITY, Bloomington, Ind., founded 1820. In 1901-02 the faculty numbered 70 and the attendance was 1334, of whom 104 were law students. The income was \$165,000. The library contained 43,000 volumes. The chief event of the year was the installation of William L. Bryan as president, who entered upon his duties on August 1, 1902. During the year a fireproof science hall was

erected at a cost of \$100,000. A student building for the use of men and women students is planned for 1903 to cost \$60,000, of which one-half was given by John D. Rockefeller, the canvass among the students and former students resulting in securing more than the amount originally pledged.

INDIANS OF THE UNITED STATES, PRESENT CONDITION OF. The Indians of the United States having governmental relations, representing about 150 officially recognized tribes, are gathered upon some fifty reservations, nearly all west of the Missouri, having a combined area about twice that of the State of Kansas. There are also some thousands of wandering Indians in the West not attached to agencies, with several mixed-blood tribal remnants in the East, some of them upon State reservations, but not subject to federal supervision.

In dealing with the Indian problem the first question asked by an inquirer would naturally be, How many Indians are there?—but a little investigation will show that before that question can be answered we must first decide another, viz., What is an Indian? Here the official figures are of little aid, and, in fact, are misleading. Under the general ruling, the government regards as Indians all persons having any appreciable proportion of Indian blood, together with a small number of whites adopted by intermarriage; and, in the Southwest, a considerable number of American and Mexican captives, originally taken as children in former raids along the frontier and reared as Indians among the tribes. With the five civilized tribes in the Indian Territory the fact is further obscured by the admission to Indian citizenship of thousands of their former negro slaves, with several thousand white men adopted by intermarriage, thousands of others enrolled on the strength of such a small proportion of Indian blood as 1-32d or 1-64th from some remote ancestor, and thousands of others whose claims have been admitted by the government enrolling commission, although repudiated by the tribal courts. In the Cherokee Nation, where invested funds and valuable lease privileges made Indian citizenship a thing particularly to be desired, these “galvanized Indians,” as they are locally known, formed an association for raising funds with which to procure their legal recognition, with the result that the citizen population of the Nation, which in 1880 was 20,336, including all recognized adoptions and the mixed-bloods of every degree, jumped to 25,978 in 1890, and is now 35,000. In 1890 the 26,000 recognized “citizens” included 6000 negroes and adopted whites, less than half of the remainder being rated as full-bloods. As practically all of the later additions to the rolls were repudiated by the Indians themselves so long as they had any voice in the matter, we may assume that the present citizen enrollment of 35,000 in the Cherokee Nation represents an Indian population of pure or mixed blood of not more than half that number. The Seminole Nation, officially reported at 2757, includes about 200 adopted whites and over 800 negroes and negro-Seminole half-bloods. Among the reservation tribes similar conditions exist, but in less degree. Thus the Kiowa tribe of 1115 persons includes 8 adopted whites and 32 captives of whom no separate account is kept. The children of captives by one or both parents may number 300 of the remainder. The confederated Comanches, numbering 1400, include probably 60 adoptions and captives, besides children of the same mixed blood. Some of the smaller remnant tribes, as the Peorias (181) and the Wyandots (342) do not now include a single full-blood. Taking the Indian population of the United States, exclusive of Alaska, as now officially reported in round numbers at 270,000, and striking out the nearly 20,000 citizen negroes, 500 citizen whites, and probably 10,000 additional legalized but repudiated claimants, in the five civilized tribes, we have left an Indian population, pure and mixed, of about 235,000. Balancing adoptions in the reservation tribes against uncounted remnants in the East, this is probably very near the true figure.

Our Indian problem therefore centres upon about 235,000 survivors of the aboriginal stock, representing an original full-blood population within the same territory of perhaps four times as many. The Indian population of Alaska, not noted in this calculation, was estimated at about 32,000 when the territory was annexed and is now probably about half that number. The New York tribes, the Pueblos, Navahos, and a few others being almost entirely self-supporting, the problem concerns itself chiefly with the tribes upon the plains reservation. To administer the affairs of these 235,000 aborigines and their alien connections the government maintains an Indian Office with over 100 employees in Washington, and a small army of agents, inspectors, clerks, teachers, mechanics, farmers, and laborers in the field at a total expenditure last year of over nine million dollars (\$9,132,028.10), a per capita cost of nearly \$39 apiece directly from the government. Missionary bodies and State legislatures contributed about \$400,000 more, making a total not far from \$10,000,000. Besides all this must be considered the lease moneys. The allotted Indian almost invariably declines to work upon the lands allotted to him in severalty under recent treaties, but at once looks around for some landless white farmer or stock-raiser to whom to rent them. The ordinary cost to

the renter on the western Oklahoma reservations, for a five-year lease of 160 acres, including the building of a 3-room house, well, and substantial wire fence at his own cost, to become the property of the Indian at the expiration of the lease, is the breaking of the raw prairie ground, and an annual money payment in addition of from 50 cents to \$2.00 per acre. In several tribes this lease income amounts to over \$100,000 per annum, in addition to what is received directly from the government or private philanthropy. The present direct money income of the Kiowas and Comanches, exclusive of school support and other benefactions, is about \$150 per capita annually, of the Kaws \$160, and of the Osages over \$300, all without the expenditure of a stroke of work or a dollar of taxation or house rent, yet each of these tribes is financially insolvent, the debts of the Osages amounting to nearly a million dollars. How best to bring to an end this constant expenditure of money and effort upon an insignificant fraction of our population, composed chiefly of incompetent or unwilling beneficiaries who make no return in taxation or the upbuilding of the communities in which they live, is the "Indian problem" of to-day.

The solution proposed by the present commissioner, Mr. Jones, is radical and eminently practical, viz.: at once to discontinue rations or other gratuities to all but the physically helpless; to limit the educational system to reservation schools devoted chiefly to industrial training; to confirm every Indian in an allotment inalienable for a reasonable term of years; and as soon as possible to cancel all further government obligations by a per capita division of all tribal funds held by the government, the Indian then to be freed from supervision and control and thrown upon his own resources, to sink or swim according as he chooses or fails to make the effort. The result would be to relieve the American taxpayers of a great and increasing burden, while yet paying over to the Indian every dollar to which he had any just claim, to turn the energies of several thousand persons now engaged in Indian work into other channels of more public usefulness, and to hasten the general development of the western country. It is doubtful if more than a small percentage of the Indians could thus stand upon their own feet, but those who survived the test would be those worthy of survival. In line with this policy 12,000 able-bodied individuals have been dropped from the ration rolls during the year, the amount thus saved being devoted to the hiring of Indian labor on roads, ditches, etc., the recipients thus giving value received.

In the meantime the problem bids fair to solve itself in the near future by the extinction of the Indian. The race in the United States is debilitated, diseased, and decaying. Almost without exception the official reports show a steady decrease, wherever reliable figures are obtainable. Thus the Blackfeet, Crows, Pawnees, Kaws, and Comanches have diminished respectively since 1875 from 7200, 4200, 2200, 516, and 721, to 2043, 1911, 629, 218, and 1409.

The government appropriation for Indian education during the fiscal year was \$3,438,000, exclusive of the large sums expended by missionary denominations, by the State of New York, and by the five civilized tribes of the Indian Territory for their own schools. The government enrollment is about 25,000 pupils in 134 day schools and 90 boarding schools upon reservations, and 25 non-reservation boarding schools. The State of New York provides for about 800 more. The 48 mission schools care for about 3400 more, and the five civilized tribes provide for about 14,000 of their own, making a grand total of about 43,000. As the Indian child usually enters school ignorant of the commonest things of civilized home life, as well as of the language, it is evident that domestic and industrial teaching must take precedence over literary, and that the practical home-keeping can best be taught in a good boarding school. Experience has also shown that the ornamental education acquired in certain much advertised eastern schools is worse than useless on the reservation. The commissioner covers the ground in a single sentence: "More reservation boarding schools and less non-reservation institutions are required."

The lease evil has grown to such proportions as to constitute now one of the greatest hindrances toward self-support by honest labor, and it is probable that steps will soon be taken to curtail the privilege to the minimum. The question of the disposition of lands whose owners have died since the allotment has also come to the front. Under the treaties the lands were inalienable for a term of years, but so eager have been the Indian heirs to dispose of them, and so anxious the white tenants and homeseekers to buy, that a bill has recently been enacted by Congress giving the heirs the option of sale under supervision. The law is continuous in action, and as on some reservations the number of allotments thus vacated by death is already nearly one-third of the whole, the speedy result will be to transfer a large quantity of Indian land to the white man by individual sales. A bill is also before Congress and will probably be passed at its next session, for the sale of over 500,000 acres of pasture reserved to the Indians on the

opening of the Kiowa and Comanche country. The effect will be to further the development of the new country.

The retroactive fight against the Kiowa and Comanche treaty, begun by Lone Wolf and others two years ago, has been adjudged adversely to the Indian contestants by the Supreme Court in a decision which promises to be of far-reaching effect. Briefly, the opinion holds that the Indian, as a ward of the government, has no inherent legal right or title whatever, but is entirely at the disposition of the government as represented by Congress, which may at its pleasure cancel any agreement, make any regulation or open any reservation without the necessity of negotiating with him. An entering wedge was the decision rendered thirty years ago that an Indian tribe, not being sovereign, could not make a treaty, since which time these instruments have been technically known as "agreements." In anticipation of unfavorable result upon this and other similar appeals and protests a considerable agitation has begun in several tribes for removal to Mexico and transfer of tribal interests and funds from the custody of the United States government to that of Mexico. The movement, which is being fostered by several attorneys and Mexican agents, appears to be strongest among the Cherokees, Kickapoos, and Kiowas, but can hardly obtain the concurrence of this government.

Among special regulations promulgated during the year may be noted an effort to systematize Indian personal names upon the family basis, with a view particularly to the settlement of heirship questions. More stringent instructions have been issued in regard to marriage, intended to prevent polygamy and the prevalent frequent change of partners without the formality of divorce. The famous "short hair" order, issued early in the year, instructing agents to use their efforts to prevent the wearing of long hair or the practice of painting, with the suggestion of deprivation of rations and "a short term in the guard-house at hard labor" in certain cases, provoked so much criticism that it has been allowed to fall into desuetude. The long-standing difficulty between the Osages and the traders in regard to the debts due from the Indians to the latter has been settled by the appointment of a commission to investigate the claims and make equitable payment from the Osage funds. Special appropriation for irrigation purposes has been made for a number of reservations within the arid belt. In view of the growing necessity of the Navahos from the invasion of their lands by cattlemen, a large body of public land adjoining their reservation on the southwest has been temporarily set aside for their use. Provision has been made for the relief of the distressed Mission Indians of Warner's Ranch, Southern California, who are about to be dispossessed on technical grounds from the homes which they have occupied for generations. No new agreements were ratified by Congress during the last session, although several are pending.

In regard to conditions in the Indian Territory, still ruled under tribal governments by the Cherokee, Creek, Choctaw, Chickasaw, and Seminole nations, known as the "Five Civilized Tribes," it may be said briefly that the work of the commission appointed ten years ago to secure the opening of this section upon the basis of regular citizenship is now practically completed. Agreements have now been reached with each of the tribes for a per capita division of the tribal lands, the readjustment of the tribal revenues, the winding up of the Indian governments and the complete installation of United States jurisdiction over the Territory not later than 1906. In the meantime the government has already assumed limited jurisdiction over educational affairs, leases, and certain other important matters. Hundreds of miles of railroads, telegraph and telephone lines are in operation or under construction, nearly 200 town sites have been plotted, and the white population of the Territory is now close to half a million.

INDIAN TERRITORY, an unorganized Territory of the United States, set apart by Congress in 1834 for Indian reservations, has an area of 31,154 square miles. In 1900 the population was 391,960; in June, 1902, as estimated by the government actuary, it was 433,000. This total is made up of Indians, some 16,000 negroes, and 300,000 whites, including men with permits to reside in the Territory. There are 5 Indian nations, and 7 reservations in the Territory. The largest town is Ardmore, with a population in 1900 of 5681.

Municipal Bond Issues.—By a Congressional act of May 19, 1902, municipalities in Indian Territory of 2000 or more inhabitants were authorized to issue bonds up to 10 per cent. of their assessed valuation for the construction of sewers and water-works and the erection of school buildings. Authority for the bonds was to be obtained by a two-thirds vote of the municipal electors and a sinking fund was to be created for the redemption of the bonds within twenty years. In municipalities where bonds were already authorized by special acts of Congress, the bonds allowed under this general act should be correspondingly diminished.

Present Conditions.—The five civilized tribes—the Cherokees, Creeks, Seminoles, Chickasaws, and Choctaws—own the entire 31,000 square miles of land. The

tribes aggregate 87,000 members, about one-fourth being full-bloods, the remainder of varying white and negro intermixtures. Some of the negroes, as among the Choctaws, for example, were originally slaves of the tribe, and were by government ruling made, as freedmen, equal sharers with their former masters in the tribe's possessions. Each tribe has a governor and a legislature. The laws are subject to the endorsement of the Department of the Interior at Washington, thus giving the federal government supreme supervision and control. In the towns, and on some farms, reside about 360,000 whites, who have followed the advent of the railroads and are transacting the business of the Territory. These whites have no rights in real estate. They lease the farms from the Indians by the year. The town lots are held under "schedule," which means that in a town officially laid out a white man may select a lot and have it credited to him. Twenty towns contain more than one thousand people each; two have five thousand each. By the laws of 1893 and 1898, the Indian lands are now being allotted to the tribal members. The lands have been surveyed, the Indians are being listed by name and personal description, and the land of each tribe is being divided among its members, each receiving an equal share. The listing of the Creeks is finished. There are 16,000 members of that tribe. Each member receives about 160 acres of land, three-fourths of which he may, with the government's permission, dispose of. After twenty-one years he is at liberty to sell the remainder of his lot. Members of the Chickasaw tribe are to receive 560 acres each. After five years all their land except the homestead may be sold without restriction. Each of the tribes has primary and academic schools for its children, supervised either by the federal government or the tribal heads. There are several railroads running through the Territory, including the "Frisco" and the Missouri, Kansas and Texas, running north and south through the Territory, with continually increasing branches and new lines. The average product of lint cotton in 1901 was 214 pounds per acre—a production exceeded only by Louisiana, with 260 pounds per acre. The cotton industry is large and increasing. Coal mines are being rapidly developed and other mineral industries are being established. The Territory has several banks, many important business houses, a number of newspapers, numerous churches and other religious institutions, and is speedily developing in all directions along the line of a greater civilization.

Political.—Tribal elections brought about several disturbances during the year in the Choctaw nation. The government is tribal under federal supervision. Charges of fraud were made by both parties. Supreme Judge Wesley Anderson, of the Choctaw government, was finally appealed to. On his order the ballot boxes were put in possession of Governor Dukes. The governor displaced Anderson and appointed Silas Cole as judge pro tem., to have charge of the election returns. As an amicable adjustment could not be reached, the party leaders appealed to the secretary of the Interior. Federal troops were despatched to the scene of factional strife to maintain order. The governor took possession of the capitol and issued commissions for members chosen by himself for the Choctaw council. The outcome of the election was the choice of Green McCurtain for governor of the Choctaws by a majority of several hundreds.

The Standing Rock Case.—The committee of the United States Senate on Indian affairs, in May, completely exonerated Commissioner Jones from a charge made against him in a letter written by Mr. William V. Wade, of Wade, N. D., who, in referring to the Sioux Indians, alleged that their reservation at Standing Rock had been rented to a company in which the commissioner of Indian affairs was connected. At the investigation before the Senate committee, Mr. Wade was unable to substantiate the charge he had made, acknowledging that in making the accusation he had been guided largely by hearsay testimony. Afterwards he wrote to Commissioner Jones and admitted that his letter on which the charge was based did Mr. Jones a great injustice, and stated his belief that the commissioner had been completely exonerated on this point.

INDO-CHINA, FRENCH, comprises the dependencies of Anam, Cambodia, Cochinchina, and Tonquin, and the district of Laos in Southeastern Asia, all of which are under the control or protection of France, and are incorporated into a single colony for administrative purposes. Their combined area is indefinite, being variously estimated at from 350,000 to 450,000 square miles, and their population approximates 18,000,000.

The colony is administered by a civil governor-general (M. J. B. P. Beau appointed in 1902), residing at Hanoi, Tonquin, which is the seat of the colonial government. He is assisted by a resident superior in each of the divisions except Cochinchina, which has a lieutenant-governor. There is a superior council which arranges the budgets for Cochinchina and Laos, and advises or supervises those of Anam, Cambodia, and Tonquin. A French military force of about 12,000 is maintained, in addition to 17,000 native troops. The colonial revenue is derived prin-

cipally from customs, government monopolies, posts, telegraphs, and railways. According to the budget of 1902 the revenue and expenditure amounted to 27,142,000 piastres and 27,128,000 piastres respectively. The French budget of 1902 provided for a contribution of 33,574,923 francs for administration in Indo-China, as compared with 19,222,000 francs in 1901.

The chief products are rice, pepper, hides, cacao, cotton, sugar, and spices. The largest article of export is rice. In 1901 the imports were valued at 202,296,000 francs and the exports 160,752,000 francs, both figures showing considerable increases over previous years. Within the last three years there has been great activity in railroad building in the country. Up to 1900 there were only 115 miles of line in operation.

The French government has undertaken to extend and consolidate the railway lines in Indo-China in order that all the colony from the mouths of the Mekong northward to the Chinese border may be connected by a single system. There is already in operation a line from Haiphong to Hanoi and thence to the Chinese frontier, and another line from Saigon to Mytho. Construction is under way on a line from Hanoi and Vietri to Lao-Kay on the Chinese frontier, to be continued thence into Yunnan, and the first section of the line is already completed. Progress is being made on a line 200 miles in length from Hanoi to Vinh, and its early completion is looked for. A presidential decree of July 25, 1902, authorized the Indo-Chinese government, in accordance with the law of 1898, to contract a loan of 70,000,000 francs for the carrying on of the projected railway construction. Part of this will be expended on the northern lines and part on extensions in the south.

INDUSTRIAL COMMISSION. The nineteenth and final volume of the *Report of the Industrial Commission* was issued on February 10, 1902. The commission was a non-partisan body created by act of Congress, June 18, 1898, consisting of 19 members, of whom 5 were senators, appointed by the president of the Senate, 5 representatives, appointed by the speaker of the House, and 9 especially qualified persons, appointed by the President with the consent of the Senate. The duties of the commission were to investigate thoroughly all matters relating to industrial and economic conditions in the country, and on the basis of their findings to recommend proper corrective or supplementary State and federal legislation. The life of the commission was limited to two years, but this period was subsequently extended to December 15, 1901, and to February 15, 1902, successively. The work of the commission, owing to the preoccupation of its congressional members in legislative affairs, was largely carried on by the presidential appointees and, in the more difficult portions, by employed experts. Of these latter there may be especially mentioned: On strikes and arbitration, E. Dana Durand; on labor legislation, Frederic J. Stimson; on trusts and industrial combinations, Jeremiah W. Jenks; on transportation, William Z. Ripley; on agriculture, J. F. Crowell; on immigration, John R. Commons; on taxation, Max West; on labor organizations, Charles E. Edgerton. The report of the commission, issued by separate subjects, and published from time to time between 1900 and 1902, comprises eighteen volumes of testimony and findings of fact, generally preceded by a digest thereof, and a final volume summing up the history and status of the principal subjects treated, and embodying the commission's legislative recommendations. Some 700 witnesses altogether were examined, of whom the larger part were heads or managers of trusts, railroad companies, factories, and labor organizations, or were otherwise directly conversant with special phases of the industrial situation. In addition, special reports were prepared by, or under the supervision of, experts upon such technical subjects as prison labor, trust and corporation laws, industrial combinations in Europe, and labor legislation. In this way much valuable information previously scattered through official, national, and State documents was collated and put in available form for public use. In general, it may be said, that considering the thoroughness of the investigation, the treatment of the subject as co-extensive with the industrial life of the nation, and the eminence either as examiners, collaborators, or witnesses of the contributors, the report, as completed, comprises an approximately complete though often uneven and inconsistent encyclopædia of prevailing industrial conditions in the United States, together with whatever fairly reasonable arguments and deductions may be made therefrom. The scope of the commission's report may be judged from the eighteen volumes issued before 1902, which treated of: Trusts and Industrial Combinations (2 vols.); Trust and Corporation Laws; Prison Labor; Transportation (2 vols.); Labor Legislation; Distribution of Farm Products; Capital and Labor in Manufactures and General Business (2 vols.); Chicago Labor Disputes; Agriculture, and Agricultural Labor; Agricultural Taxation; Capital and Labor in the Mining Industries; Immigration and Education; Foreign Labor Legislation; Labor Organizations; Labor Disputes and Arbitration; Railway Labor; and Industrial Combinations in Europe. The final volume treats of the subjects of Agriculture; Mining; Trans-

portation; Manufactures, Trade and Commerce; Industrial Combinations; Labor; Immigration; Taxation; Irrigation; the statistics of prices, exports, combinations, etc., and an index of the particular volume and also of the entire report. While it is impossible even to indicate here the breadth and manner of the commission's report, yet a single subtitle of the article Transportation, in the final volume may be mentioned as illustrative, viz.: The Anthracite Coal Problem. Under it is given a general description of the coal fields, of the railways running to these fields, and somewhat of their economic history, the relation of the independent operators to the railroads, the peculiarities of the anthracite fields and of the foreign demand for coal, and the influence of these peculiarities in causing the railroads to pool their issues; the history of previous attempts at railroad consolidation in the fields and the method of the present consolidation and its probable economic effects. Again, under the title Immigration, a full account is given of the status of immigration, illustrated with charts; the economic effect of wages and employment; the agricultural distribution of immigrants; the method of inspecting immigrants, together with recommendations for the revision and codification of existing laws relating to the deportation of immigrants and the restriction of immigration.

INFLUENZA, EPIDEMIC (LA GRIPPE). According to Pfeiffer, Canon, Klein, and others, the pathogenic organism of influenza is a very minute bacillus which develops in the nasal passages, throat, larynx, bronchial tubes, and blood. These organisms are present in large numbers in the bronchial secretions and occur only during the acute stages of the disease, gradually disappearing as the attack abates. The disease has been widely distributed during 1902 both in Europe and America, and although it is described as of a rather mild type, the death rate has been on the increase. The Chicago Board of Health has introduced a method of direct microscopical examination of the sputum of persons suffering from influenza, and it has been found possible to recognize the bacillus in this way without waiting for the growth of a culture. Accurate diagnosis of the affection is thus made in a very short time with great benefit to both physician and patient. The disease shows a predilection for the nervous system, being characterized by peculiar nervous and mental manifestations. Dr. S. E. Jelliffe, of New York, has attempted to demonstrate a relation between the increased number of suicides and the prevalence of influenza during the last dozen years. He quotes the *Weekly Bulletin* (March 1, 1902) of the Health Department of Chicago as follows: "Against the conditions which have produced these results [an enormous increase of mortality from pneumonia, the chronic diseases, suicide, and other forms of violent death—53 per cent. more of these than in the previous year] sanitary effort and administration can do little. Influenza . . . not only disastrously complicates other diseases, but exerts a most baneful effect upon the nervous system, causing all forms of mental disturbances, from mere irritability of temper to suicidal melancholia and homicidal mania."

INSANITY. The fifty-fifth report of the British commissioners of lunacy shows that the total number of certified lunatics in England and Wales on January 1, 1901, was 107,944, an increase of 1333 since the same date in 1900. The commissioners observe that although there has been a diminishing rate of increase during the last ten years, previous experience has shown that it is not wise to count upon a continuance of this satisfactory condition. It was suggested that this diminution might be made continuous if an hereditary tendency to insanity was made a bar to marriage, or if marriage was prohibited to persons with a distinct family history of alcoholism. After three admissions into an asylum a case should be regarded as incurable recurrent insanity, always excepting acute attacks of insanity following childbirth. The recent international conference on the treatment of the insane, held at Antwerp, in September, 1902, adopted the following resolutions: That the confinement of the insane henceforth be abandoned except in the case of those recognized as dangerous. That the system of boarding insane persons with families be carried out whenever possible. That it is expedient to renew the wish formulated at the congress at Paris for the establishment of schools for special classes of the mentally weak, under medical supervision. That the manner of placing patients be left entirely to physicians, and that forcible restraint should be condemned. According to *Charities* for February, 1902, Massachusetts contemplates establishing "State farms" for its insane. It is planned to take the "pauper insane" from country, city, and town poor-houses and bring them together in large farm colonies, under as nearly domestic conditions as possible. This farm is 1500 acres in extent and within two years the experiment will have been fairly made and the public will be able to judge the results. The national government has recently completed an asylum for insane Indians at Canton, S. D., costing about \$60,000. It is stated that this will not accommodate all the Indians needing asylum care. Contrary to the general belief on this subject, that insanity is unknown among savage races, the Indians become insane over religious matters, and the same causes which have

increased insanity and diseases of degeneration among negroes, apply to Indians. It has been very properly argued, however, that their mental degeneration was not due to savagery, but to the vices of advancing civilization, especially the abuse of alcohol. Concerning the relation of insanity to alcohol, Dr. Robert Jones, superintendent of the London County Council's Asylum at Claybury, writes in the *Lancet* of October 25: "If the Lunacy Commissioners' Blue Book for England and Wales be consulted, the proportion per cent. of instances in which alcohol has been assigned as the cause of insanity to the yearly average number admitted into asylums in the five years from 1895 to 1899 inclusive, is 21.8 for males and 9.5 for females. The proportion is much higher in Scotland, and after allowing for the deaths of those whose form of insanity is more immediately fatal than those caused by alcohol, there are, I believe, upon the lowest computation, remaining in the asylums at the present time no less than 10,900 males and 5800 females who are mentally decrepit through the effects of alcohol." During the nine years that the Claybury asylum has been open, 8493 patients have been admitted, of whom 21.2 per cent. of the males and 12.6 per cent. of the females owed their insanity to drink. A total of over 800 men and 594 women have been thus rendered incapable of productive work through their own acts and have been or are being supported by the taxpayers. With regard to the reputed increase of the drink habit among women Dr. Jones says that the proportion of women committed to asylums for insanity brought on by alcohol is on the increase, especially among the laboring classes. Whereas the proportion per cent. of these patients to the total admissions into asylums bears a ratio in the private class of 20.8 males and 9.4 females, it is 22.7 for males and 9.7 for females among the pauper class. This possibly indicates less moral stamina among the women of the poorer classes, and on the contrary, the increased inhibition which education, the influence of public opinion, and the effects of social ostracism may exercise upon the well-to-do. See ALCOHOL.

INSECTS AND THE PROPAGATION OF DISEASES. The importance of the rôle played by insects, particularly mosquitoes, in the transmission of diseases is now thoroughly recognized. Many investigations have been on foot during 1902, but most of the work done was merely confirmatory of results already arrived at. The adoption of the mosquito theory as a basis for preventive measures against yellow fever and malaria has been productive of much good. Major Gorgas describes the manner in which the sanitary department of Havana rid that city of yellow fever and lessened the number of cases of malaria. It was the aim of the department to destroy all the *stegomyia* mosquitoes possible, leaving as few as might be to transmit the fever from patient to patient. Efforts were also directed toward preventing mosquitoes that escaped destruction from biting yellow fever patients and finally to kill all mosquitoes that had become infected. The screening of patients, as well as of all water receptacles, was urged, and the pouring of petroleum on all such drains, privies, etc., as could not otherwise be protected. A house-to-house inspection and crusade against mosquitoes was made, and infected houses disinfected by burning pyrethrum powder at the rate of one pound to every thousand cubic feet of air space. Dengue has been added to the list of mosquito-borne diseases. This is an acute febrile disease of tropical and subtropical countries, characterized by febrile paroxysms, pains in the joints and muscles, and sometimes a cutaneous rash. Dr. Harris Graham, professor at the American College at Beyrout, Syria, reports that the disease is due to a protozoal parasite, and is conveyed by the common *culex* mosquito. The United States marine hospital service has requested its health officers to furnish information upon the appearance of epidemic dengue, in order that investigators may be immediately sent to study the disease. The war on mosquitoes has been carried on with vigor in many places. In the borough of Queens, New York City, all the breeding places of mosquitoes have been treated with petroleum. In Flushing, L. I., the residents have been doing similar work. At Lawrence and Inwood, L. I., where \$1000 were appropriated by the authorities, excellent results have been accomplished. The Long Island Railroad is assisting the work done by draining all pools of water on its property. The New York City Board of Health sprinkled crude petroleum on ponds and other breeding places of the mosquito during the summer of 1902, the health commissioner asking for \$10,000 to carry on the work. Baltimore and New Orleans have adopted similar measures, and many other communities are now preparing for regular summer campaigns against these pests. There is a plan for exterminating mosquitoes by causing a fungus disease among them, based on the belief that the infection of mosquitoes in this manner will exterminate them cheaply and efficiently. The professors of biology in the universities of Wisconsin and Chicago insist that the plan is feasible, and Prof. R. H. Pettit has shown that mosquitoes are killed by this fungus, which is closely allied to the one which kills flies in the autumn. The mosquitoes are found attached to the surface upon which they die by filaments of the fungus extending from the body of the insect, which is filled with the fungus growth, and is finally

completely covered by it. Spores appear upon the outside of the mosquito, which are forcibly ejected into the air, and, coming into contact with other mosquitoes infect them. Mr. A. Weaver, an electrical engineer, while making some experiments in harmonic telegraphy, found that at a certain note all the mosquitoes near flocked to the instrument. The phenomenon is thought to be an instance of sexual selection. Hiram Maxim, according to the London *Lancet*, made similar observations by means of an electrical lamp which gave off a constant musical note. The instrument was soon covered with mosquitoes. It has been suggested that this peculiarity may be the means of destroying mosquitoes on a large scale. See YELLOW FEVER.

INTERNATIONAL SUNDAY SCHOOL CONVENTION. See SUNDAY SCHOOL CONVENTION, INTERNATIONAL.

IOWA, a central western State of the United States, has an area of 56,025 square miles. The capital is Des Moines. Iowa was organized as a Territory July 3, 1838, and admitted as a State December 28, 1846. The population in 1900 was 2,231,853; in June, 1902, as estimated by the government actuary, it was 2,229,000. The populations of the largest cities in 1900 were: Des Moines, 62,139; Dubuque, 36,297; Davenport, 35,254; and Sioux City, 33,111.

Finance.—The balance in the treasury of the State of Iowa at the beginning of the calendar year 1902 was \$780,527.75. Receipts from all sources during the year amounted to \$3,215,611.74, while the total expenditures were \$3,069,222.84, leaving a balance on hand on January 1, 1903, of \$926,916.65. The main items of revenue and the amounts derived therefrom were as follows: From county treasurers on account of State tax levy, \$1,536,519.73; from county treasurers for the support of insane in State institutions, \$380,490.61; from county treasurers for the support of State charitable institutions, \$36,943.02; from the collateral inheritance tax, \$119,719.85; from the tax on insurance companies, \$224,569.37; from payment of all claims against the United States government on account of the Civil War, \$456,417.89; from fees collected by State officers, \$282,160.42; from miscellaneous sources, \$178,790.85. Iowa has no debt.

Agriculture.—For the first time in a number of years Iowa was surpassed in the value of its annual farm produce in 1902 by Illinois. This could occur only through a partial failure of one of the two staple crops, corn and oats, while Illinois obtained at the same time a nearly normal yield. In 1901 Iowa was the first State in the production of both corn and oats. In 1902 long-continued spring rains and early fall frosts combined to decrease the amount of Iowa's corn crop about 25 per cent. The quantity (297,686,016 bushels) was equal to the average yield, but the poor quality made it hardly desirable for milling purposes and diminished its value for feeding. The corn acreage was 9,302,688 acres and the total value of the crop \$98,236,385. The wet weather also caused a considerable portion of the oats to rust and go down before it was completely filled. There were 4,063,138 acres of oats, from which were threshed 124,738,337 bushels, worth \$31,184,584; 1,094,490 acres of spring wheat were harvested, yielding 13,462,227 bushels, valued at \$7,404,225. The crop of winter wheat was about one-tenth as large. The barley crop, which covered 513,499 acres, amounted to 13,505,024 bushels, valued at \$4,861,809. The damage done to the cereals by the wet weather was partially compensated by an unusual crop of hay, in the production of which Iowa ranked second only to New York State. The yield of 5,211,232 tons, cut from 3,101,924 acres, was valued at \$33,873,008. Of potatoes, 16,966,642 bushels, valued at \$5,768,658, were produced on 173,129 acres. On the whole, crops were considerably better than in 1901, when corn suffered so severely from drought. The price of land has been steadily advancing in Iowa for over a decade, but 1902 witnessed unusual activity. One minor cause of this—and noteworthy even from a sociological standpoint—is the general spread of rural telephones and rural free delivery of mail throughout the State. The building of inter-urban trolley lines has been begun. Another cause of the appreciation in value of farm property is the growing importance of stock-raising in the State. According to the statistics of the Department of Agriculture the value (\$277,410,484) of Iowa's farm animals on January 1, 1903, was 30 per cent. greater than the value of those in any other State. Iowa had more horses and 75 per cent. more cattle than in any other State except Texas, the numbers being 1,144,570 horses, and 4,964,924 head of cattle. There were 7,438,655 swine—more than in any other two States. The State mine inspector reported 15,175 mine employees in 1901, nearly all of whom are coal miners. The production of coal increased about 3 per cent. in 1902.

Railroads.—The annual report of the Board of Railroad Commissioners of Iowa for the year ending June 30, 1901, shows that the total railroad mileage of the State for that year was 9,353.9 miles, representing a capitalization of \$141,498,923.01 and a funded debt of \$149,913,248.70. The total passenger earnings for the year were \$12,540,451.03. The total freight earnings were \$34,049,174.67, and the gross

income including all earnings and receipts was \$54,480,776.67. The number of passengers carried was 8,155,706. The passenger earnings per mile of road were \$1,551.08. The number of tons of freight carried was 17,308,153 and the freight earnings per mile of road were \$4,206.56. The total expenses of the railroads of Iowa amounted to \$37,449,971.10, leaving a net revenue of \$17,314,664.85. The mileage in 1900 was 9,171.48; the gross earnings \$52,974,571.77, and the expenses \$35,409,424.82, leaving a net revenue of \$16,665,146.79. The number of employees in 1901 was 37,836, receiving \$22,253,822.79 in wages and salaries, while for 1900 the number of employees was 37,696, receiving in wages \$21,363,319.55. Taxes paid to the State in 1901 amounted to \$1,521,553.42, or \$162.53 per mile of road. No official statistics have been issued since 1901, but from unofficial sources it is estimated that the gain in traffic, both passenger and freight, has been even greater in 1902 than in 1901.

Legislation.—The regular session of the Twenty-ninth General Assembly of Iowa began on January 13 and ended April 11, 1902. Among the acts passed were the following: The law providing that savings banks and State banks should not make any loans to any one person or corporation in an amount exceeding 20 per cent. of their capital stock, was amended to permit such banks to loan not exceeding one-half their capital stock to any one person or corporation on notes or bonds secured by unincumbered farm land in the State worth at least twice the amount loaned. Railroads are required to submit to an executive council consisting of the governor, the treasurer, the auditor, and the secretary of state, for purposes of taxation, a detailed report of their gross and net earnings on business originating or transacted within the State; and if the railroads refuse to make such reports the executive council is authorized after having assessed the property for taxes upon the best available information, to add an indemnity of 25 per cent. thereto. Loan and investment companies are also directed to submit reports showing the value of their property and business in the State for purposes of taxation. A negotiable instruments law was enacted uniform with that passed by various other States. An act was passed providing for the compulsory education at school of children between seven and fourteen years, and authorizing the establishment of truant schools and the appointment of truant officers. Boards of police and fire commissioners were created in cities of 60,000 or more, to be appointed by the mayor with the consent of the council and to hold office for six years. The board was to consist of three members representing both political parties and to be removable for cause by act of the municipal legislature. All officers of the police and fire departments except the chief of police and the chief of the fire department were to be removable for cause by the board of commissioners.

An habitual criminal act provides that any person who has been twice convicted for terms of not less than three years each may upon the third conviction be adjudged an habitual criminal and imprisoned for not more than twenty-five years. Kidnapping is made an offense punishable by not less than ten years in prison.

An act was passed to provide for the construction of fire escapes and other safety appliances in buildings of three stories and higher.

An act was passed strengthening the provisions of the act of 1901 regulating the practice of osteopathy and providing for the issue of revocable certificates to practice.

A "Louisiana Purchase Exposition Commission" was appointed to consist of thirteen members to represent the State of Iowa and to prepare Iowa's exhibit at the Louisiana Exposition to be held at St. Louis in 1904. For the purposes of this exhibit \$125,000 were appropriated.

The executive council was directed to raise by State taxation for general State purposes approximately \$2,300,000 for the year 1902 and approximately \$2,000,000 for the year 1903. A proposed constitutional amendment, to be referred to the next General Assembly for action, provided for increasing the number of State senators and representatives, and directing inequalities of representation to be equalized every ten years instead of as at present at every regular session.

Another amendment similarly proposed provided for general biennial elections instead of as at present, electing the governor, lieutenant-governor, the superintendent of public instruction in odd years and the secretary of state, treasurer, attorney-general, representatives, and State senators in the even years. The proposed amendment also involves having the legislature meet in the odd years after 1906 instead of as at present in the even years.

Political.—One of the most significant political events of the year was the refusal of Speaker Henderson in September to run for re-election to Congress. His own reason recited in a letter in which he declined to accept the renomination, was that he found, after careful study, that there was a growing sentiment among Republicans in his district and State that trusts "can be cured or the people benefited by free trade, in whole or in part," a sentiment which he could not endorse, and refused to stand for. In another statement he said: "I must say, and emphatically, that I

do not believe that a single schedule of the Dingley tariff law can be so amended as to relieve the people from the oppression of trusts or combinations of capital, however named, and that such action may involve the retarding of our expanding commerce and getting and holding of foreign markets. Indeed, I believe such a plan to be fraught with grave dangers to the people." The question arose in several quarters as to Mr. Henderson's real reasons for retiring and opinions were freely expressed that the reason given by him was inadequate. Mr. Henderson's estimate of Iowa opinion on the tariff issue was confirmed by Governor Cummins, who said that it was "practically the unanimous sentiment of the Republican voters that the time had come for certain changes in the tariff." Judge B. P. Birdsall, who was nominated in place of Henderson, declared for tariff reform in his letter of acceptance on September 25, saying: "The Republican party of Iowa . . . will not permit the policy of protection to become a shield for the greed and avarice of man."

Conventions and Platforms.—Only minor State officers were nominated at the Republican convention, held at Des Moines on July 30, but the proceedings were of more than usual interest, because of the attitude of party leaders regarding the reaffirmation of the sentiment regarding tariff matters voiced in the platform of 1901. In that platform tariff abuses were denounced, and a demand was made for reform. Leaders like Henderson, Wilson, Shaw, and Allison were not in sympathy with the tariff reform movement advocated by Governor Cummins, Director of the Mint Roberts, and Senator Dolliver. In the committee on resolutions, the governor scored a victory, securing the readoption of the tariff resolutions of 1901, and supplementing them by a new clause approving the President's trust policy. The reaffirmation of the tariff plank of the previous year was taken to indicate that the Republicans of Iowa, excepting the protectionist faction, would not sanction the use of the tariff to protect trusts in charging higher prices to the American people than they receive for their products in foreign markets. In the Republican platform the administration of President Roosevelt was strongly endorsed, reciprocity with Cuba was advocated, modifications of the tariff "from time to time" were favored, and combinations of capital in restraint of competition condemned.

The Democratic State convention was held at Des Moines on September 3. The majority report, ignoring free silver, was adopted by a vote of 384 to 344. The platform declared in favor of tariff reduction, condemned the Philippine war, and demanded that all monopolies should be driven from American soil. In the tariff plank it was asserted that "the tariff system should be immediately reduced to a revenue basis, as the only one absolutely essential remedy to overcome the trusts;" and "that the Republican party, as now organized, is powerless to revise the tariff downward or curb the trusts it shelters is, we believe, clearly shown by the present attitude of its national leaders."

Elections.—At the regular biennial State election, held November 4, 1902, the officers voted for were secretary of state, auditor, treasurer, and attorney-general. The vote for secretary of state was Martin (Rep.) 229,219; Bourke (Dem.) 149,912. The legislature of Iowa on January 21, 1902, re-elected William B. Allison (Rep.) as United States senator for the full six years' term commencing March 4, 1903, and ending March 4, 1909; and chose Jonathan P. Dolliver (Rep.) to serve out the unexpired term ending March 4, 1907, which was left vacant by the death of John H. Gear (Rep.). Mr. Dolliver was appointed senator August 23, 1900, and took his seat in the United States Senate December 3, 1900. There was no contest in the Republican ranks over either senatorship. The legislature for 1903 will consist as before of 39 Republicans, and 11 Democrats in the senate, and 84 Republicans, and 16 Democrats in the house.

State Officers Serving in 1902 and 1903.—Governor, Albert B. Cummins, elected for two years, term ending January, 1904; lieutenant-governor, John Herriott; secretary of state, William B. Martin, term ending 1905; treasurer, Gilbert S. Gilbertson, term ending 1905; auditors, Frank F. Merriam, term ending 1902; B. F. Carroll, term ending 1905; attorney-general, Charles W. Mullin, term ending 1905; superintendent of education, R. C. Barrett, term ending 1904—all Republicans.

Supreme Court in 1902 and 1903—Chief justice for the year 1902, Scott M. Ladd, and for the year 1903, Charles A. Bishop; associate justices, C. M. Waterman, who resigned and was succeeded on July 1, 1902, by Charles A. Bishop; H. E. Deemer, John C. Sherwin, Emlin W. McClarin, S. M. Weaver, and Scott M. Ladd (in 1903)—all Republicans, except Weaver and Bishop, Democrats.

For Congressional representatives see UNITED STATES (paragraph Congressional Representatives).

IOWA, UNIVERSITY OF, Iowa City. Ia., founded 1855 and reorganized 1860. The student body in 1902 numbered 1512, the faculty and officers of administration 165. The whole number of graduates since the reorganization was 6130. The income of the university had increased to \$402,000. The buildings, grounds, and equipments were valued at \$653,000. The library contained 63,000 volumes. The re-

quirements for admission to the college of dentistry were raised from one year of high school work to two years, or 16 preparatory credits. For the college of pharmacy, at least one year of high school work, or 8 preparatory credits are now required instead of the completion of the preparatory course. The college year has been divided into two semesters, at the beginning of each of which new classes in all regular first year courses are organized, thus enabling students graduating from the high schools in the middle of the year to enter as regular freshmen without delay. The university now has 210 secondary schools in its accredited list. During the year a series of assemblies were held, which were addressed by members of the faculty or by visitors, and were very popular. Two new buildings for the college of medicine are in process of construction. Physical training has been made compulsory for first and second year students, and has resulted in a revival of interest in athletics on the part of the women students of the university.

IRELAND. See GREAT BRITAIN.

IRELAND, CHURCH OF, has been an independent body since 1871, when the act of disestablishment (1869) became operative, the union with the Church of England having existed since 1800. The governing body of the church, the general synod, meets annually in Dublin. It is constituted of a house of bishops, and a representative house of the clergy and laymen, chosen every three years by the 23 diocesan synods. There are in the Church of Ireland 2 archbishops, 11 bishops, 1200 incumbents, and 360 curates; and a church population estimated at 579,385.

IRON AND STEEL. In the United States, another year of great activity and increased production is to be recorded for the iron and steel industry. There was not only a much greater production than in previous years, but also a demand which was far from satisfied by the output of American works and which had in part to be met by imports on a large scale. The production of pig iron in the United States amounted to 17,821,307 gross tons, an amount equal to the production of England, Germany, and Belgium, the two countries first named coming next after the United States on the list of producers. In Great Britain conditions while generally leaving much to be desired, were a distinct improvement upon those of 1901. This was due in part to the fact that the United States, so much occupied with home consumption, had ceased attempting competition in the markets of the world, leaving to England a large share of the foreign trade. Accordingly the exports of pig iron were about ten times as large as in 1901 and those of steel billets nearly four times as large. The production for 1902 was stated as being about half a million tons in excess of the previous year, when it amounted to 7,761,890 gross tons. Germany and Luxemburg also show an increase in production for 1902 over 1901, when the output was 7,860,893 metric tons. Belgium's contribution to the world's total was about 1,250,000 tons.

Production of Iron Ore in the United States.—The mines of the Lake Superior region continued during 1902 to furnish the greater part of the iron ore used in American furnaces, and their total production amounted to 27,800,000 long tons, or about 80 per cent. of the total production of the United States. This production is an increase of about 25 per cent. over that of 1901, the increase by districts being shown in the following table:

DISTRICT.	1902	1901	DISTRICT.	1902	1901
	<i>Tons.</i>	<i>Tons.</i>		<i>Tons.</i>	<i>Tons.</i>
Mesaba.....	13,290,000	9,004,890	Michigan.....	298,000	300,000
Menominee.....	4,409,000	3,605,449	By all rail.....	450,000
Marquette.....	3,715,000	3,254,680			
Gogebie.....	3,558,000	2,938,155	Total.....	27,800,000	20,889,237
Vermilion.....	2,080,000	1,786,063			

The mines of this region have experienced great development in recent years and new discoveries of ore are constantly being made. The first important mining in this region was done in 1855, and since that time 220,000,000 tons of ore have been excavated. From 1898 to 1902 the output has doubled, and for the latter year was four times that of 1894, eight times that of 1886, and sixteen times that of 1882. This growth is fairly well distributed among the different mines, and in 1902 there were six producing over a million tons of ore each, while in 1898 there were only six which produced 300,000 each. At that time there were 79 mines in operation, as compared to 120 in 1902. Where the mines are worked from the surface with steam shovels they can be rapidly developed, and the Stevenson mine, which was opened in 1900, shipped during 1902 enough ore to enable it to stand second on the list. The ore coming from this region is much of it low grade and contains comparatively small amounts (40 to 55 per cent.) of iron, but such ore is mixed with that of

higher quality previous to shipping and is accordingly in the form required for the furnaces. There seems to be considerable ore still in sight in this region and explorations are constantly being made to locate new deposits. On the Mesaba range these have been most successful, and it is estimated that in 1902 some 75,000,000 tons of ore were discovered. The mines and ore reserves of the Lake Superior region are now concentrated in the hands of a comparatively small number of owners, chief of which is the United States Steel Corporation. This company in 1902 mined and transported in its own or chartered vessels some 16,000,000 gross tons of ore. It should be said in passing that iron ore forms over two-thirds of the commerce of Lakes Superior and Michigan, and in 1902 it amounted to 24,000,000 tons out of a total of 36,000,000 tons which passed through the Sault Ste. Marie Canal.

Looking now at other iron producing districts of the United States it is necessary to consider the South, and especially Alabama, where some 3,500,000 tons of ore were mined during 1902. This was largely for local consumption, as the furnaces of the vicinity can take care of the greater part of the output. In addition, ore aggregating about 2,400,000 tons was mined in Virginia, West Virginia, Tennessee, Kentucky, and Georgia. The activity in Alabama was shown by the fact that new furnaces were constructed at Thomas and at Ensley, and by the fact that there were at the close of 1902 36 furnaces in blast and 7 idle, as compared with 31 in blast and 10 idle at the beginning of the year. Ore in smaller amounts was also mined in New Jersey, Eastern Pennsylvania, Ohio, Indiana, and other States. The United States Geological Survey in its annual report on mineral resources gives the production of iron ore by States for 1901 and 1900 as follows:

PRODUCTION OF IRON ORES IN THE UNITED STATES IN 1900 AND 1901, BY STATES AND TERRITORIES.

STATE OR TERRITORY.	1900	1901	STATE OR TERRITORY.	1900	1901
	<i>Long Tons</i>	<i>Long Tons</i>		<i>Long Tons</i>	<i>Long Tons</i>
Minnesota	9,884,399	11,109,537	Georgia, North Carolina, and South Carolina	336,186	215,599
Michigan	9,926,727	9,654,067	Kentucky and Iowa.	55,057	46,499
Alabama	2,759,247	2,801,732	Ohio.....	61,016	44,185
Pennsylvania.....	877,684	1,040,684	Connecticut and Massa- chusetts	31,185	25,214
Virginia and W. Virginia..	921,821	925,394	Maryland	26,223	21,218
Tennessee	594,171	789,494	Missouri.....	41,366	14,230
Wisconsin.....	746,105	738,868			
New York.....	441,485	420,218			
Colorado.....	407,084	404,037			
New Jersey.....	344,247	401,989			
Montana, Nevada, New Mexico, Utah, Texas, and Wyoming.....	149,158	284,514	Total.....	27,553,161	28,887,479

It must be remembered that during 1902 it was necessary to import iron ore and that the total amount brought into the United States was about 1,200,000 tons. Of this about 60 per cent. came from Cuba, while the remainder was the output of Canada, Newfoundland, and Spain. This ore was used by furnaces on the seaboard or in the east portions of the United States.

Pig Iron.—The output of pig iron in 1902 was greater by some 11 per cent. than that of 1901 and was about double the production of 1896. So great were the requirements of the domestic trade that 625,383 tons (as compared with 62,930 tons in 1901) had to be imported from England and Germany, paying a duty of \$4.00 a ton in addition to ocean freights. It was believed that the demand for pig iron during 1902 was about 1,000,000 tons in excess of the possible output of American furnaces. The production for 1902 in comparison with the previous year is shown in the following table:

	1901	1902		1901	1902
	<i>Tons.</i>	<i>Tons.</i>		<i>Tons.</i>	<i>Tons.</i>
Foundry and forge.....	4,541,250	5,166,568	Spiegeleisen and ferro- manganese.....	291,461	212,981
Bessemer pig.....	9,596,793	10,393,168			
Basic pig.....	1,448,850	2,038,570	Total.....	15,878,354	17,621,307

The year's production must be considered marvelous in view of the poor facilities or the transportation of iron ore and coke, and the effects on eastern furnaces resulting from the anthracite coal strike. There were 307 furnaces in blast on December 31, 1902, as compared with 266 on December 31, 1901, and 232 on December 31, 1900. The production by States is shown in the accompanying table.

PRODUCTION OF PIG IRON BY STATES.

(Tons of 2240 lbs. each.)

SOUTHERN STATES.		1902	1901	NORTHERN STATES.		1902	1901
		Tons.	Tons.			Tons.	Tons.
Alabama		1,472,211	1,225,212	Pennsylvania		8,117,800	7,343,257
Virginia		537,216	448,662	Ohio		3,631,388	3,326,425
Tennessee		392,778	337,139	New York		401,369	283,662
West Virginia		183,005	166,597	New Jersey		191,380	155,850
Kentucky		110,725	68,462	Illinois		1,730,220	1,596,850
Georgia and N. Carolina...		32,315	27,333	Michigan		155,218	170,762
Maryland		303,229	303,186	Wisconsin *		278,987	207,531
Texas		8,095	2,273	Missouri †		269,930	203,409
				All others		15,446	11,828
Total		3,034,574	2,578,864	Grand total		17,821,300	15,878,854

* Including Minnesota.

† Including Colorado and State of Washington.

So rapid has been the consumption of pig iron that at the end of the year there was practically none held in storage, the actual stock of manufacturers amounting to 49,951 tons, as compared with 70,647 tons at the close of 1901, and 442,270 tons at the close of 1900.

The production of pig iron is largely carried on about Pittsburg, and this district produces about 35 per cent. of the total for the United States, the Carnegie Steel Company, with its 20 blast furnaces, contributing over two-thirds of this amount. A large number of new furnaces were started during 1902, which when completed and in operation will raise the output of Pittsburg works to 45 per cent. of the entire pig iron production of the country. These new furnaces are of large size and will enable great quantities of ore to be handled at a minimum of cost.

Steel.—The demand for steel in almost every form served to make the year 1902 memorable. The total output was in excess of 15,000,000 tons, two-thirds of which was Bessemer, or converted steel, the remainder being open hearth steel with a certain amount of crucible and other special varieties. The chief event of the year has been the progress made in the erection of new open-hearth furnaces. These plants can be operated successfully by purchasing pig and scrap iron in the open market, whereas a Bessemer plant must be of large size and be operated in connection with blast furnaces and constant and uniform supplies of ore. The increased output due to these new open-hearth furnaces is estimated at between 1,200,000 and 1,500,000 tons. The demand for steel rails during the year was large and the railway construction (6024 miles, according to the *Railroad Gazette*), was the largest for eight years. This together with renewals made active business, and the price of rails remained steady during the year at \$28 a ton, enabling the maker to derive a profit of about \$10 a ton. The United States Steel Corporation in this department owing to the magnitude of its works with the consequent economies, is able to make a profit considerably greater on this class of steel. There was also an unparalleled demand for finished steel for building, and beams were sold in large lots at \$32 a ton. Often, however, the demand was so keen that \$50 and \$60 a ton was paid for early deliveries. The same condition prevailed as regards plates and the demand for this material, especially for freight cars, is constantly increasing. Sheet steel was not so active during the latter part of the year owing to the large number of mills recently constructed to supply this material. In the field of wire, bars, nails, pipe, etc., there was a uniformly good business.

The following table indicates the average prices for iron and steel prevailing during the year 1902 at Pittsburg:

RANGE OF IRON AND STEEL PRICES IN PITTSBURG, 1902.

	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
Bessemer pig iron	\$16.75	\$17.00	\$17.50	\$20.75	\$22.00	\$22.25	\$22.25	\$22.50	\$23.00	\$24.00	\$23.75	\$23.50
Foundry No. 2	16.50	17.00	19.00	20.75	21.50	22.00	23.00	23.00	23.00	23.50	23.50	23.25
Gray forge	16.00	16.50	18.00	19.75	20.25	20.50	21.00	21.25	21.50	21.00	21.00	21.00
Bessemer steel billets	27.00	30.00	31.00	32.00	32.50	33.50	32.00	31.00	31.00	30.00	30.00	30.00

Tank plate	1.60	1.60	1.60	1.60	1.60	1.60	1.60	1.60	1.60	1.60	1.60	1.60
Steel bars	1.50	1.55	1.60	1.60	1.60	1.60	1.60	1.60	1.60	1.60	1.60	1.60
Steel rails	28.00	28.00	28.00	28.00	28.00	28.00	28.00	28.00	28.00	28.00	28.00	28.00
Wire nails	2.00	2.05	2.05	2.05	2.05	2.05	2.05	2.05	2.00	1.90	1.85	1.85
Cut nails	2.05	1.95	1.95	2.05	2.05	2.05	2.05	2.05	2.05	2.05	2.05	2.05
Ferro-manganese, domestic	52.50	52.50	52.50	52.50	52.50	52.50	52.50	52.50	52.50	52.50	52.50	52.50

During 1902 the United States Steel Corporation devoted its energies to com-

pleting and adding to its equipment and works so as to secure greater capacity and economy of operation. In December it absorbed the Union Steel Company which had been formed by a combination of the Union and Sharon Steel companies. This gave the United States Steel Corporation the large blast works of the Union Company at Donora, Pa., and the elaborate plant of the Sharon Company at Sharon, Pa., besides large ore deposits in the Lake Superior region. The price paid was \$45,000,000 in bonds secured by mortgages on the property. At these works, which are of the most modern type, it is the intention of the steel corporation to carry on a large part of its wire and nail manufacture. It was stated that by acquiring these properties the steel company had greatly strengthened itself at a possible vulnerable point besides getting possession of valuable and important ore supplies. The United States Steel Corporation also purchased during 1902 the property of the Troy Steel Products Company, and thus secured three blast furnaces, a rolling mill, and a basic Bessemer plant. It was believed at the time of purchase that only the blast furnaces were desired and that they would be used for the production of basic iron for the wire factories at Worcester, Mass. The effect of the policy of the steel corporation continues to be extremely beneficial to the industry at large and these benefits are shared by the independent manufacturers. Prices are maintained steady and unwholesome competition is prevented. The trust has been a steady influence in the pools and associations for the regulation of prices and has prevented unduly high prices from which a disastrous reaction would have resulted. It has been the policy of the company to so consolidate its works as to reduce the expense of maintenance and to get the plants into the best possible condition.

The year 1902 was one of such prosperity that in the opinion of many similar conditions and profits could not be anticipated for the future. Others, however, maintained that the iron industry was now so firmly established that it could look forward with every possible confidence and that with the diminution of the domestic demand caused by less activity in manufacturing generally, this country by its improved and cheaper processes would be able to export iron and steel products to the markets of the world.

IRRIGATION. In accordance with a recommendation of the President, and the pledges made by both Republicans and Democrats in their national platforms of 1900, a law was passed on June 17, 1902, providing for the reclamation of the arid lands of the West. The bill was opposed upon the score of unconstitutionality and inadvisability by the leading Republican representatives of New York, Pennsylvania, Ohio, Illinois, Iowa, and other States east of the Mississippi, and was finally passed only as a means of party harmony. It was said by the opponents of the bill that it was an opening wedge to unlock the treasury doors to endless demands that the West might make upon it; that the transcontinental railroads were engineering the bill, hoping for the increase of their traffic by the enhancement of land values; that the bill if effective in reclaiming arid lands would injure the agriculturists of the East; finally that as the bill was intended to aid only one section of the country it constituted class legislation and was unconstitutional. To these criticisms the advocates of the bill replied that the sums appropriable were definitely limited in the act; that the aid of the railroads did not affect the merits of the bill; that no harm would come to eastern farmers since very different crops would be raised on these western lands, and that it was no more improper for the government to aid interstate industries by means of irrigation works than for it to aid interstate commerce by river and harbor works.

The bill as finally enacted and the reasons for its several sections as stated by its advocates were as follows:

1. All moneys received from the sale of public lands in Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, and Wyoming, beginning with the fiscal year ending June 30, 1901, excepting the allowances to registrars and receivers of land offices, and the 5 per cent. of the land receipts due to the several States and Territories for the support of agricultural colleges, are directed to be placed in a special fund of the treasury, to be known as the "reclamation fund," to be used for the survey, construction, and maintenance of irrigation works and for the storage and diversion of waters for the reclamation of the arid and semi-arid lands of the West.

In case the receipts from the sale of other public lands than those specified above be not sufficient for the support of agricultural colleges under the act of 1890, providing for the more complete support of State colleges as established under the provisions of the Morrill act of 1862, then the deficit shall be supplied from funds in the general treasury. The public lands affected by the law amount to about 535,000,000 acres, or one-third of the entire area of the United States proper, or two-thirds of the western half of the United States. The proceeds from the sale

of public lands for the fiscal years 1901 and 1902 amounted to somewhat over \$6,000,000, and this sum would become the nucleus of the reclamation fund.

To show more clearly the extent of the reclamation fund and its geographical division, the following figures may be given, showing the income from the sale of public lands for the fiscal year 1901 in each of the arid States and Territories: Arizona, \$42,586.16; California, \$205,030.40; Colorado, \$252,277; Idaho, \$206,449.94; Kansas, \$20,182.22; Montana, \$367,130.10; Nebraska, \$103,040.49; Nevada, \$9,008.61; New Mexico, \$75,091.83; North Dakota, \$449,025.43; Oklahoma, \$370,427.13; Oregon, \$364,761.47; South Dakota, \$113,475.22; Utah, \$98,329.22; Washington, \$257,046.22; Wyoming, \$206,863.87; making a total of \$3,140,725.31.

2. The secretary of the Interior, who is charged with all the administrative authority given under the act, is directed to survey and construct irrigation works and to report annually to Congress. The irrigation works authorized include canals reservoirs and artesian wells and it was expected that the secretary would at once make extensive surveys, utilizing the results of such preliminary work as had already been done by the government, with a view to determining the most feasible and practicable as well as the most urgent irrigation projects required.

3. The secretary is directed to withdraw from public entry all public lands required for irrigation works, and also to accept as homestead entry all lands proposed to be irrigated. The lands left open to homestead entry cannot be apportioned to one individual in lots of less than 40 acres or more than 160 acres, and shall moreover be subject to all the special conditions and stipulations of the irrigation act.

4. Contracts for the construction of irrigation works may be made by the secretary only when there is sufficient money in the reclamation fund, and the area of public lands to be allotted to each entryman is to be determined, within the limits of from 40 to 160 acres, by the secretary as appears to him reasonable. The secretary also is to determine what charges in repayment for the irrigation of his land shall be paid by the entryman, and what charges shall be borne for the irrigation of their land by any private owners of land. In all cases the charges are to be determined with the view of returning to the reclamation fund the estimated cost of constructing the irrigation works; but in all such construction eight hours is to constitute a day's work and no Mongolian labor can be employed.

The land that an entryman may obtain is limited to a maximum of 160 acres in order to prevent large holdings, and the object is, so far as possible, to attract actual settlers of small means who, under existing circumstances, with nearly all arable land in the United States already occupied, find themselves homeless.

The provision excluding Mongolian labor was made with the purpose of providing settlers with work pending the irrigation of their lands. Naturally some portions of the lands to be irrigated will be found already in private ownership; and, as it would be unjust to deprive such owners of the advantages of irrigation, it is directed that they shall be entitled to the benefits thereof upon payment of their due share of the cost. But as will be seen in the following section, effort was made to prevent large private holdings and to break up those large private holdings already existing by enacting that the secretary shall not sell water rights to any private owner for more than 160 acres.

5. Before an entryman may obtain patent for his land he shall reclaim at least one-half of the total arable area of his entry and pay to the government all charges apportioned against him. These charges are to be paid in annual installments, not exceeding ten, and are based on the cost of irrigation. No right to the use of water can be sold to private owners for tracts exceeding 160 acres, and no sale shall be made in any event unless the land owner shall be a bona fide resident or occupant.

6. When payments shall have been made upon the major portions of the lands made arable from any one irrigation work, the secretary is authorized to transfer to the owners of such lands the management and operation of the works, reserving to the government, however, the title to and management of all reservoirs. This provision follows the usual custom of transferring irrigation works to the owners of the land irrigated; but on account of their extreme importance to the large class of water users affected, storage reservoirs are to be retained by the government.

7. The secretary is authorized to acquire any necessary land by purchase or by condemnation under judicial process.

8. It is directed that the rights already obtained by owners under State and Territorial laws shall not be disturbed by this act, and that in general the secretary shall proceed in conformity with such laws; with this important exception, however, that the right to the use of water acquired under the act shall be appurtenant to the land irrigated, and that beneficial use "shall be the basis of the measure and the limit of the right." The customary policy of Congress in conforming with local laws is observed by this section so far as possible. It is believed that by such conformity the States will be stimulated to enact more equitable water laws than they

have done, and that through the provision that water rights shall be appurtenant to the land those States will repeal any laws that have hitherto allowed a vested interest in the water right.

9. The secretary is directed to expend in each State and Territory so far as possible, the sums derived from the sale of public lands in that State or Territory; and in every expenditure, the net expenditure in any State or Territory as measured by such sales is directed to be equalized within each ten-year period. Each State will be inclined strongly to insist that money derived from the sale of lands within its borders shall be expended therein; and while from the interstate nature of the work it was impossible to observe this desire entirely, it was intended to do so as far as possible.

Under this act, the estimated construction cost of works must be returned to the reclamation fund by those using the water, but there is no provision for the repayment of money expended in maintaining and operating works so long as they are in the hands of the government. This may be an indefinite period. If the major portion of the land to be benefited by any particular work should never be sold, the works could apparently be operated permanently free of cost to water users.

The work thus far done in carrying out the purposes of this act has been confined to surveys and examinations of different projects. Investigations are being carried on to arrive at an understanding of the scope of the work to be done and the conditions which will govern the expenditure of money and the disposal of works to settlers. Although no projects have been definitely located, the law has already produced a marked effect on western settlement and land values. There has been a great increase in immigration and a rush to file on public land. It is claimed that a large number of these filings are speculative, and the President in his annual message recommended the appointment of a commission to investigate and report upon the questions involved in the disposal of public lands.

The rapid rise in the value of agricultural products and irrigated land in the arid West during the past year has caused renewed activity in irrigation construction by private enterprise. The active competition for the control of water as well as land has increased filings on streams and litigation over water rights. The danger to future development which this threatens has aroused public sentiment in several arid States to the need of a reform in irrigation laws which will secure more satisfactory results in the settlement of water titles. A committee of the California Water and Forest Association in California has drafted a bill for submission to the legislature which meets this winter. A committee of the Engineers' Association of Montana has drafted an irrigation code for submission to the legislature of that State, and similar legislation is being considered in Utah and Nevada.

The subject of rights to the water of interstate streams has attracted increased attention during the past few months through the beginning of a suit by the State of Kansas against the State of Colorado in the United States Supreme Court to determine the respective rights of these two States to the waters of the Arkansas River. The facts leading up to this litigation are as follows: The Arkansas River rises in Colorado and derives nearly all its water supply from the mountains at its head. Leaving Colorado, it flows for 200 miles through Kansas, finally emptying into the Mississippi. In this litigation it is claimed by Kansas that the construction of ditches and the diversion of the water in Colorado has reduced both the underground and surface supplies in Kansas, causing great hardship and loss to settlers. These allegations are denied by Colorado, and the issue is now as to the facts.

In this litigation a number of perplexing issues are involved. The Arkansas is a navigable stream. On the upper part of its course, riparian rights are abrogated; on the lower part of its course, they are recognized. Among the questions, therefore, are the respective rights of appropriators for irrigation in the two States and the respective rights of parties claiming water under the riparian doctrine and the doctrine of appropriation.

The building of reservoirs has been the most marked feature of construction during the past year. High-priced crops, as a rule, require irrigation late in the season, and this, on many streams, can only be supplied through the storage of the floods which run to waste in the spring. The construction of these works has, as a rule, proven profitable to their builders and added greatly to the value of the lands and products. Sugar beets, potatoes, fruit, and other special crops requiring intensive culture are taking the place of grain and hay crops. This line of development has been especially marked in Colorado, where a number of large reservoirs have been built and several sugar beet factories erected within the year.

The volume of water made available for irrigation by means of pumps has been greatly increased during the past year. This is especially true of the rice-growing sections of Louisiana and Texas and many of the fruit-growing districts of California. Many small pumps were also put up by farmers throughout the South and middle West in order to supply water for market gardens or small areas. In

some places these pumps serve the double purpose of drainage and irrigation. Water is pumped from land which is too wet and used on land which needs moisture. In California the increase in pumping has given rise to litigation regarding rights to underground supplies, and with further development there seems likelihood of both litigation and legislation to settle the questions thus created.

No large enterprises have been carried out during the year, but there has been a steady growth in all the States. The State engineer of Colorado estimates the increase in the irrigated area in that State at 200,000 acres. The State engineer of Wyoming reports for the two years ended November 30, 1902, the issue of 1324 permits for new canals, the estimated cost being \$1,638,000, and the area to be irrigated 677,000 acres. Permits were issued for enlargements of existing canals to cost \$202,000, the water to be used on 150,000 acres. The State engineer of Nebraska reports for the year 1902 the issue of fifty permits for new canals and a number of enlargements. The area to be watered from canals completed during the year is reported at 15,200 acres. The farmers of the Jordan Valley in Utah have established a pumping plant at the outlet of Utah Lake to relieve the scarcity of water in that valley. Their plans include the enlargement and extension of their canals, and the reclamation of large areas of desert land. The same activity extends to the other arid States, but statistics are not available.

The additions to irrigation literature during the year include a number of reports by State engineers and by the Agricultural and Interior Departments of the government. The Office of Experiment Stations in the Department of Agriculture is studying the engineering, legal, and social phases of irrigation, while the United States Geological Survey of the Interior Department has charge of stream measurements and the location and construction of works under the national irrigation law.

There has been a great increase in the publications on irrigation in newspapers and magazines. A few books have also been published, among which are: *Irrigation in the United States*, by F. H. Newell, T. Y. Crowell & Co., New York; *Irrigation Farming*, by Lucius Wilcox, the Orange Judd Co., New York; *Irrigation Institutions*, by Elwood Mead, the Macmillan Co., New York. The most notable development in foreign countries is the completion of the Assuan Dam (see DAMS) in the Nile by the Egyptian government. Previous to the federation of the Australian provinces, each province enacted its own irrigation laws. Since the federation, the unification of these laws and the settlement of interstate rights have proved a most perplexing matter. This is particularly true regarding the use of the Murray River which forms the boundary between the provinces of Victoria and New South Wales. The respective interests of these two provinces in this stream are now being looked into by a governmental commission. See VICTORIA.

ISHAM, EDWARD S., a prominent lawyer of Chicago, died February 17, 1902, in New York City. He was born January 15, 1836, in Bennington, Vt., graduated at Williams College in 1857, and was admitted to the bar in Vermont and Illinois. In 1858 he entered the office of Hoyne, Miller & Lewis in Chicago. The following year he formed a partnership with James L. Stark, and in 1872 went into partnership with Robert T. Lincoln, the son of President Lincoln. Since 1884, through the admission of a third partner, the firm has been known as Isham, Lincoln & Beale. In recent years his practice was confined to the higher courts, and embraced many cases of importance in constitutional law. He served for many years in the Illinois legislature, in which he was a member of the judiciary committee.

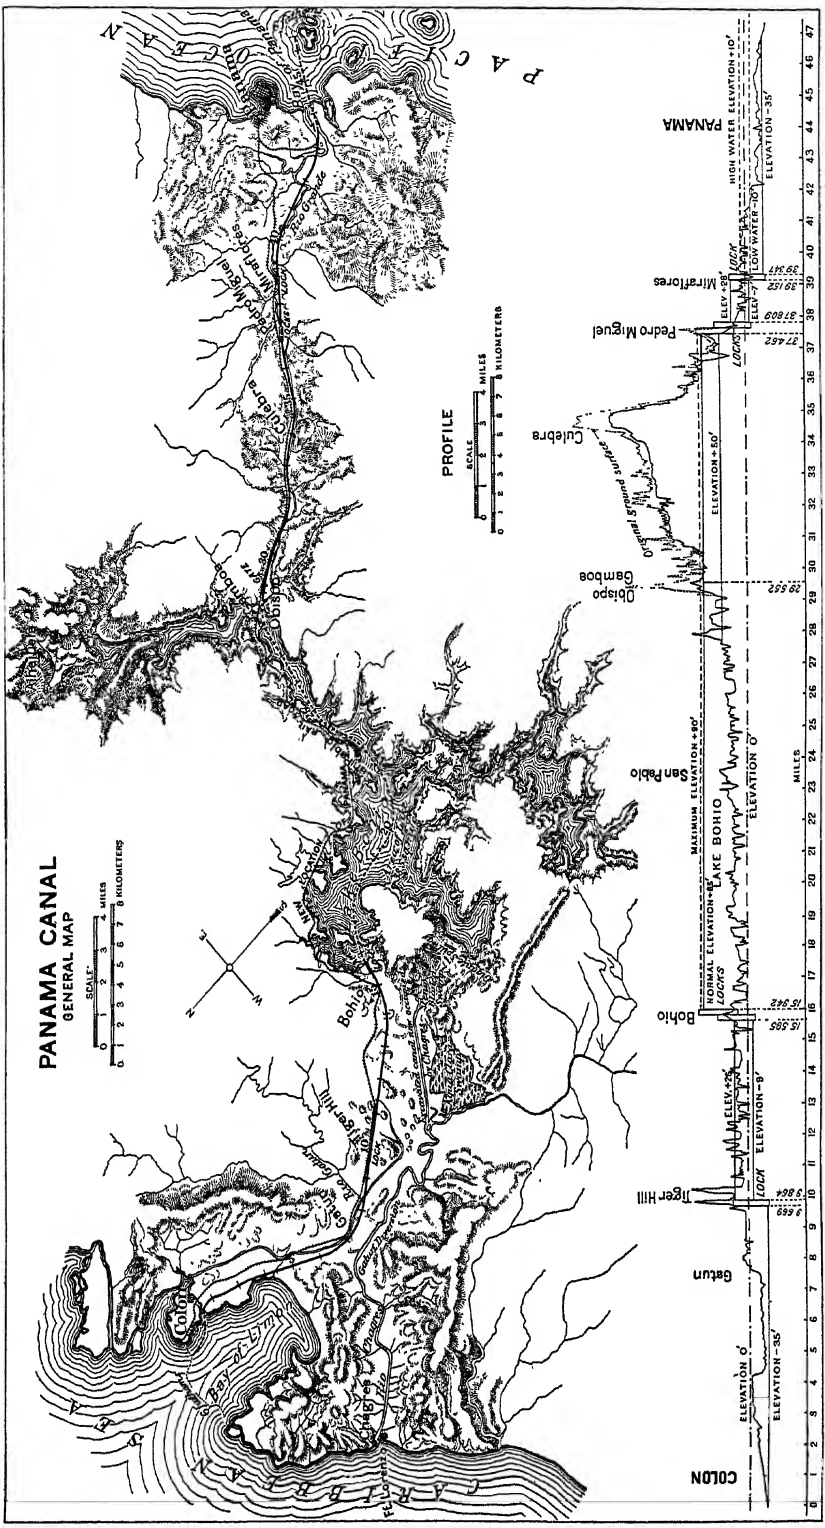

ISTHMIAN CANAL. On January 4, 1902, the Panama Canal Company offered to sell its abandoned works on the Isthmus of Panama, together with all its rights and titles to lands and harbor privileges for \$40,000,000—the valuation put upon the property by the American Canal Commission, appointed in 1901. The Panama Canal Company had previously set a price of \$100,000,000 upon their property rights—an absolutely prohibitive figure. On January 8 the House, by a vote of 308 to 2, passed a bill providing for the construction of the Nicaragua Canal at a cost of \$180,000,000. The Morris amendment, leaving the choice of route with the President, was voted down 170 to 120. The arguments in favor of the amendment were: (1) A first cost of but \$184,233,358 for the Panama Canal, as against \$189,864,062 for the Nicaragua Canal, and a saving of \$1,300,000 a year in cost of maintaining the Panama Canal according to the commission. (2) Natural harbors at Panama and Colon, while equally good harbors at the terminals of the Nicaragua Canal would cost \$5,000,000. (3) The advantage of having an alternative during the negotiations with Isthmian republics. (4) Consideration for French stockholders. The arguments for the Nicaragua route were: (1) The uselessness of the Panama route for sailing vessels. (2) The remoteness of the Panama route. (3) Distrust of the Panama lobby. (4) The need of new negotiations with Colombia for permanent concessions, and the difficulty of treating with a government likely to be overthrown at any moment. Upon receipt of the Panama Company's tender, the Canal Commission prepared a supplemental report, which they transmitted to President Roose-

velt January 20, 1902, recommending that the offer of the company be accepted. The commission estimated that the Nicaragua route is one or two days shorter for steamships between the eastern and the western coast of the United States, while the Panama route is one or two days shorter for vessels between the eastern coast of the United States and the western coast of South America. The amount of traffic by the Nicaragua Canal would not be enough greater to offset the greater cost of maintenance.

During February the attention of Congress was called to the Darien-Mandingo sea-level canal to be constructed by private capital backed by a government guarantee. It was claimed that this route is only 29½ miles long—as against 49.09 miles for the Panama and 183.66 miles for the Nicaragua Canal; good deep-water harbors exist on both sides; no curves, dams, or locks are necessary; and all difficulties of controlling flooding by rivers would be avoided. It would be necessary, however, to tunnel through the mountains for a distance of five miles, but outside the tunnel there would be no cuts deeper than 8 to 15 feet. The projectors estimated that the canal could be finished in four years for less than \$100,000,000. The Canal Commission in 1901 rejected the route as impracticable, and put the cost of construction at \$289,000,000. Neither Congress nor the country seriously considered this route. It was charged that the trans-continental railroad interests which are opposed to any canal, were backing the Panama route, simply as the most feasible way of blocking all action. It was also asserted that the franchise obtained by the French company was illegally granted by the Colombian president, and would be worthless even if the present government should be able to suppress the revolution and prolong its precarious existence for a few months until the next revolution. The deadly climate of Panama was urged as another and well-nigh unanswerable objection to that route. After due deliberation, however, the Senate agreed upon a compromise measure introduced by Senator Spooner, which was accepted by the House and approved by President Roosevelt, June 28, 1902. While this act was looked upon generally as a victory for the advocates of the Panama route, and as practically assuring that the canal would be built by that route and not across the state of Nicaragua, nevertheless it held out to the supporters of the latter route enough hope if, for any reason the negotiations with Colombia should fall through, to secure their support. As a piece of legislation satisfactory to both parties it was therefore heralded in the press as a particularly successful compromise. However, as the matter stood at the time, it was evident that the mere passage of an act authorizing the provisional construction of a canal at Panama did not by any means settle the matter, as there still remained the possibilities that the French title to the canal was invalid, that Colombia would refuse to accept the terms of the United States, or that, after all other objections had been overcome, the treaty with Colombia would be defeated in the United States Senate by the opposition of the Nicaragua advocates.

Isthmian Canal Act.—By this act the construction of an isthmian canal was authorized; by the Panama route if that should prove feasible, otherwise by the Nicaragua route. The act empowered the President, if he could obtain a satisfactory title thereto, to acquire for the United States, at a cost not exceeding \$40,000,000, all the rights, franchises, and concessions, and all the real and personal property, including at least a controlling share in the Panama Railroad Company, of the New Panama Canal Company, of France. Similarly the President was authorized to acquire for the United States from the Republic of Colombia, on such terms as he considered reasonable, perpetual control and jurisdiction over a strip of land not less than six miles wide and extending from the Caribbean Sea to the Pacific Ocean. On this strip of land the United States was to be enabled to operate the Panama Railroad, to construct, operate, and protect a canal, and to retain jurisdiction over its terminal ports. Further rights and territory, useful to the general purpose of the canal, might be obtained by the President from Colombia in his discretion. The canal to be constructed was to utilize so far as possible the work of the New Panama Canal Company, was to be of sufficient capacity for vessels of the largest existing tonnage, or of the largest tonnage that could be reasonably anticipated. Commodious terminal harbors were to be provided, safeguarded by adequate works of defense. If the President was unable to obtain title from the New Panama Canal Company, and to get the desired concessions from Colombia "within a reasonable time and upon reasonable terms" then he was authorized to secure territory from Costa Rica and Nicaragua for the construction of a canal by the Nicaragua route. This canal was to have the same specifications as the other, and was to utilize the San Juan River and Lake Nicaragua so far as they were available. For the construction of a canal, by either route, an Isthmian Canal Commission was created, to consist of seven members appointed by the President with the consent of the Senate. Of the seven members at least four were to be expert engineers, and of these four at least one was to be of the United States army and one of the navy. Ten

million dollars, besides the \$40,000,000 contingent upon acquiring the New Panama Canal Company, was appropriated for preliminary expenses, and the President was authorized, upon the final determination of the route, to enter into construction contracts aggregating \$135,000,000 additional in the case of the Panama route, and \$180,000,000 additional in case of the Nicaragua route. To meet these contracts the secretary of the Treasury was authorized to borrow \$130,000,000, issuing therefor, at not less than par, 2 per cent. bonds, redeemable in ten and payable in thirty years. The bonds were to be issued in denominations of twenty dollars or their multiples, and were to be offered as a purely popular loan, no commissions being "allowed or paid thereon." This act answered the imperative demand of the American people for a canal across the isthmus, but it threw the heavy responsibility of selecting the route upon the President and his advisers.

Title to the Panama Canal.—In accordance with the power invested in him by this act of June 28, 1902, President Roosevelt instituted inquiries into the legality of title possessed by the French Panama Canal Company, and its ability to transfer legal possession to the United States, and ordered the attorney-general to investigate the matter. Attorney-General Knox stated in an opinion given out October 25, 1902, that the new Panama Canal Company of France could give the United States title to its property and partially built canal across the isthmus in the Republic of Colombia. This opinion proceeded from the history and laws governing the new Panama Canal Company, which were virtually as follows: In 1878 a contract was entered into between the Republic of Colombia and the Civil International Inter-Oceanic Canal Company for the construction of an isthmian canal and its operation for 99 years. The lands necessary for the construction were granted by Colombia during the life of the concession, certain annual payments were to be made Colombia, the canal was to be neutral, and the concessionaire might transfer its rights, but could not cede or mortgage them to a foreign government. The concessionaire did transfer its rights in 1879 to M. Ferdinand de Lesseps, founder of the Universal Company of the Inter-oceanic Canal of Panama, commonly called the old Panama Canal Company, and this company proceeded upon the work of construction until 1888, when it became bankrupt and was in 1889 placed in the hands of a liquidator. The liquidator, under authorization of the courts, in 1894 turned over the assets of the old company, including provisionally a large majority of shares in the Panama Railroad Company, to another company called The New Panama Company; the old company in return for its assets to receive 60 per cent. of the profits from the canal. On January 9, 1902, the new Panama Canal Company offered to sell its rights and property on the isthmus, and its archives in Paris, to the United States government for the sum of \$40,000,000. This offer had been authorized by vote of the general meeting of the stockholders, subject however to future ratification by them, had been consented to by the liquidator, and the official representative (*mandataire*) of the bondholders of the old company, and had been approved by the civil tribunal of the Seine, which, under a special law of parliament in 1893 regulating the liquidation of the old company, was required to pass upon all acts of the liquidator, tending to alienate the assets of the company. On suit of one of the bondholders of the old company, asking that this approval be reversed, the civil tribunal held on July 3, 1902, that the plaintiff had no cause for action since under the law of 1893 he was represented by the *mandataire*, and that he could not question the right of the New Panama Company to sell since he had no legal relation with that company. This decision upon the same reasons was affirmed by the Court of Appeals of Paris on August 5, 1902.

Now under these ruling conditions it was queried in America whether the title given to the United States government, in case it purchased, would be valid, and to determine this a special investigation was made in Paris, first by special attorney Charles W. Russell, and later by the attorney-general in person. Negatively stated, the main questions considered, were as follows: (1) The new Panama Canal Company had not power to sell the property. (2) The liquidator of the old Panama Canal Company had not power to assent to the sale. (3) The French courts had not power, either as to the liquidator or as to the new company, to authorize the sale. (4) The property, if taken over by the United States, would be subject to the total outstanding obligations to the stockholders, bondholders, and other creditors of both companies. (5) The purchase could not validly be made under the congressional act of 1902 which authorized purchase from the New Panama Canal Company only and not from the liquidator of the old company. The reasoning and conclusions arrived at by the attorney-general as to these objections were: (1) The New Panama Canal Company is an anonymous partnership of a non-commercial kind, subject by a special law of 1893 to an act concerning commercial associations passed in 1867, and to the commercial code and customs of commerce. Such a company may, unless a third party intervenes as a prior creditor, sell its property as might any private merchant. Now the third party in this case, the old Panama Canal Company to

whom the new company had promised 60 per cent. of its anticipated profits, was also a private partnership, though outside of the law of 1867 and the commercial code and customs of commerce, and amenable only to the civil code. The old company was entirely competent to release the new company and having done so the latter could dispose of its property at will. But though the new company could thus sell its property it ought still to be shown that the "general meeting" of the stockholders of the new company had power to offer its property as it did. This power, however, follows from the by-laws of the company, made by the founders or original stockholders, which permit the general meeting to amend the by-laws in such a way as to make the sale legally binding. (2) With regard to the powers of the liquidator of the old company, it should first be noted, as stated above, that the civil tribunal of the Seine in a decision affirmed by the Supreme Court of Paris, decided that the liquidator had authority to assent to the sale. In general, however, the liquidation of non-commercial partnerships formed prior to 1893, not being specifically arranged for by law, are regulated by the courts in much the same way as if they were commercial bodies organized after 1893. A liquidator is commonly appointed *ex necessitate* because with a large number of partners unanimity of agreement is practically unattainable. Following this precedent, a liquidator was appointed by the court in 1899 for the old Panama Canal Company and was vested with extensive powers, among which was that of ceding or contributing to any new association the whole or part of the old association's assets. But if the liquidator could contribute the company's assets and thereby rather continue than dissolve the company, he could certainly perform the ordinary liquidator's duty of realizing upon the company's assets; as agreeing, for example, to the sale of the property to the New Panama Canal Company. Aside, however, from these general principles of law, the special act of the French parliament in 1893, expressly recognized and sanctioned the power of the liquidator to alienate the assets of the company and at the same time authorized the lower courts to approve or disapprove the particular measures which the liquidator might take in pursuance of this grant of power. (3) The French courts did not authorize the New Panama Canal Company to sell its property; for that company was an active, solvent concern, and needed no judicial authorization. The courts did, however, approve the liquidator's consent to the sale and to question the validity of that approval is to question the validity of the special law of 1893, under which it was made. The law has, in fact, been criticised as being in violation of fundamental rights, but it is "if anything defective in regarding too much the rights of individuals," and in any event "authority to declare a law, regularly passed and proclaimed ineffective, has not been found to exist in the French courts." (4) The objection that the United States if it took over the property would be responsible to the creditors of both the old and the new company, is found to be unsound. As relates to the creditors of the new company, the stockholders are bound by the action of their representatives in the general meeting who offered the property for sale, the company has no bondholders, and the small claims of the general creditors may be paid before the completion of the sale. So far as the old company is concerned, "it is not perceived how there could be any law or equity for subjecting a purchaser of an article sold as assets of a failing partnership to the debts of the partnership. If that were the law, there would be no purchasers of such assets, the creditors would receive no payment of their debts out of the proceeds nor the stockholders any dividend of a residue." It would not follow, however, that the property bought, as distinguished from the company bought from, might not be affected by definite liens diminishing its value. To ascertain if such were the case, an exhaustive investigation was made into all actual or possible judgments, liens, and mortgages upon the property. From this it appeared that the seemingly simple process of mortgaging the real property of the company in Colombia had never been resorted to; probably because the popularity of the enterprise in France had permitted bonds to be floated without difficulty until just before the collapse of the company and because, also, title to the Colombia lands had never been put into final form. But, if any apprehension was still felt, all danger of future litigation could be avoided by inserting in the treaty which it would be necessary to make with Colombia, a clause to the effect that the United States and the property purchased by it could not be proceeded against in the courts of Colombia without the consent of the United States. (5) The objection that Congress had authorized purchase from the new Panama Canal Company and not from the liquidator of the old, was found to be unreasonable because (1) the purchase was in fact from the new company, the liquidator merely waiving rights as to the property transferred, and because (2) even if this were not so, and the liquidator had joined with the new company as vendor, it would be contrary to frequent decisions of the Supreme Court of the United States, to hold a law abortive for a technicality, and notwithstanding its plain intent which in this case was to obtain title from the owner, whomsoever, of certain

SCENES ON THE PANAMA CANAL—(Upper) A Section of the Canal to-day
(Lower) A Cut in the Cordilleras

specified property. For these reasons the attorney-general was of opinion "that the United States would receive a good, valid, and unincumbered title" to the property offered by the new Panama Canal Company.

The Treaty with Colombia.—No sooner had the doubt about the validity of the French title been satisfactorily disposed of than a new difficulty arose in the shape of an apparent disposition on the part of Colombia, through its representative at Washington, to refuse to accept the terms offered by the United States in the treaty then pending, which provided for the surrender by Colombia of control over the territory traversed by the canal. In May, 1902, while the Isthmian Canal Bill was still before Congress, Mr. Hay, the secretary of state, sent to both Houses copies of the prospective treaties concerning the canal which had been submitted to both Colombia and Nicaragua. The stipulations in the proposed treaty between Nicaragua and the United States were as follows:

(1) Nicaragua leases in perpetuity to the United States the exclusive right to build and operate a canal through its territory and the United States shall guarantee the sovereignty, independence, and territorial integrity of the Republic of Nicaragua.

(2) A strip three miles on each side of the route selected shall be known as the canal district, and areas of lands and waters within that district shall pass into the possession, use, and control of the United States, without cost or charge. Damages arising from the building of the canal shall be ascertained by a joint commission and their awards shall be paid by the United States.

(3) The sovereignty of Nicaragua shall continue over the canal district, but the United States may enforce peace and order by the use of its forces.

(4) Free ports shall be established at the terminals of the canal and no discrimination shall be made as to tolls.

(5) The canal shall be opened to all nations, shall never be blockaded, war vessels of a belligerent shall not remain in the canal more than twenty-four hours, shall not revictual in the canal, nor shall a belligerent disembark troops or munitions of war in the canal.

(6) The United States shall pay and discharge Nicaragua from all liability on account of claims of citizens of the United States arising prior to the signing of the treaty.

(7) The United States shall pay \$6,000,000 and an annual rental of \$25,000 as compensation for the privileges granted.

The treaty with Colombia as submitted by Secretary Hay provided:

(1) That the government of Colombia authorizes the New Panama Canal Company to sell its rights to the United States.

(2) The United States shall have the exclusive right to construct and operate the canal.

(3) The United States shall have a zone five kilometres wide for the canal, for a period of 100 years, with the privilege of renewal, the zone to be neutral territory guaranteed by the United States, a joint commission created by the United States and Colombia to enforce sanitary and police regulations.

(4) The sovereignty of Colombia to be maintained over the territory of the canal.

(5) Lighthouses, ports, and other aids to navigation to be constructed by the United States, also hospitals, and necessary aqueducts and drainage works in Panama and Colon.

(6) Colombia will not cede or lease to any foreign government any of its islands or its harbors that might interfere with the use or the safety of the canal and to enable Colombia to carry out this stipulation the United States shall give to Colombia the material support that may be necessary.

(7) Damages arising from the construction of the canal shall be appraised by a joint commission, to be paid by the United States alone.

(8) The ports at either end of the canal shall be free, and dues in the canal equal for all nations.

(9) No taxes shall be imposed on the property used in constructing the canal.

(10) The canal shall be neutral in perpetuity.

(11) Forces necessary to protect the canal shall be provided by Colombia, but if she cannot effectively do so, she may call on the United States to do so.

(12) The United States shall begin work on the canal in two years after the exchange of ratifications of the treaty.

(13) For any privileges granted the United States shall pay Colombia \$7,000,000, and after fourteen years a reasonable annuity, to be fixed by arbitration if necessary.

(14) This concession shall lapse if in five years the United States shall not have begun the construction of the canal nor completed it within the period allowed (twenty-four years).

Public opinion in the United States was strongly opposed to the building of a

canal through foreign territory, and the press loudly demanded the purchase outright of a strip six miles wide on each side of the canal, or better yet, the acquisition of the whole state of Panama. But even the liberal terms proposed by Secretary Hay were not sufficient to satisfy the representative of Colombia. On November 25, Señor Concha, Colombian minister at Washington, informed Secretary Hay that he could not accept, on behalf of Colombia, the terms offered by the United States. It appeared that the concessions granted to the French canal company were to have expired in 1904, but were subsequently extended to 1910. It was rumored that Colombia intended to declare the extension void, and either construct the canal herself or take possession of the canal property and sell it to the highest bidder. Negotiations were broken off for the time, and attention was fixed upon the Nicaragua route, but the governments of Nicaragua and of Costa Rica were disposed to take advantage of the circumstances, and announced that the existing treaties between them and the United States would not be renewed upon expiration. It was generally believed that Señor Concha was not sincere in his opposition, and intended to hold up the whole project for his own profit. Later he was recalled by his government because of his attitude in the affair. Negotiations were then renewed with Señor Herrera, chargé d'affaires of Colombia at Washington, but at the end of the year, the matter was still unsettled. Colombia had finally consented to the lease of a neutral zone on the terms proposed by the United States. It was also arranged that the Panama Railroad, which, under existing agreements, would become the property of Colombia after sixty years, should revert to the United States at the expiration of that term. The point of disagreement was the question of payment. It was agreed that the annuity, instead of being increased at periods of fourteen years, should be fixed at the rate determined upon in the treaty, but the United States was unwilling to pay more than \$10,000,000 down and an annuity of \$100,000 or \$125,000, while Colombia demanded \$600,000 annuity. Again charges of corrupt lobbying by the transcontinental railroads, to defeat any canal, were rife. The railroad across the Isthmus of Tehuantepec is a very important factor in the situation, as when its terminal harbors are improved, it will be a convenient route between the eastern and western seaports of the United States. The sentiment of the country was decidedly against submitting to any obstructive device on the part of the Isthmian republics even though the canal should be delayed several months.

ITALY, a constitutional monarchy of southern Europe comprising the Apennine Peninsula, and the islands of Sicily and Sardinia. The capital is Rome.

Area and Population.—The aggregate area is 110,674 square miles, and the population, according to the final results of the census of February 10, 1901, was 32,475,253, an increase of over 14 per cent. since 1881. Racially the population is remarkably homogeneous, the only elements of importance beside the Italian, being the Albanian, French, and Greek. The populations of the principal cities (1901) were: Naples, 563,731; Milan, 491,460; Rome, 463,000; Turin, 335,639; Palermo, 310,352; Genoa, 234,800; Florence, 204,950; Bologna, 152,009; Venice, 151,841. The inhabitants are almost entirely adherents of the Roman Catholic religion, which is nominally the state religion, but complete freedom of worship prevails. Public schools of every grade are maintained by the state, the provinces, and the communes, attendance in the primary grades being nominally compulsory. Hitherto the educational system has been neither well organized nor well regulated, but there has been decided improvement in the last year.

Government.—The present constitution of Italy is an expansion of the Sardinian fundamental statute of 1848. By its provisions the executive power is vested in the sovereign, by whom it is exercised through a cabinet of responsible ministers. The legislative authority is vested jointly in the king and a parliament, consisting of two chambers, a senate and a chamber of deputies. The senate, containing 348 members in 1901, consists of the adult princes of the royal house and an unlimited number of members named by the crown. The chamber of deputies is composed of 508 members elected for five years by what is practically universal suffrage. The king has power to dissolve the parliament, but is required to convoke it annually. All money bills must originate in the lower chamber. The ruling sovereign is King Victor Emmanuel II., who succeeded to the throne on the death of his father, Humbert I., July 29, 1900. The ministry in 1902 was constituted as follows: Premier, without portfolio, Zanardelli; interior, Giolitti; foreign affairs, Prinetti; treasury, di Broglio; finance, Carcano; justice and ecclesiastical affairs, Cocca-Ortu; war, Poina di San Martino (later General Ottolenghi); marine, Morin; commerce, industry, and agriculture, Baccelli; public instruction, Nasi; public works, Giusso; posts and telegraphs, Galimberti.

Army and Navy.—The army of Italy, recruited by a system of conscription, consists of the permanent regular army and the mobile and territorial militias. Personal military service is obligatory on all able-bodied citizens between the ages of

twenty and thirty-nine. The terms of service differ for different categories from two to five years with the colors, and from fourteen to seventeen years in the reserve or in the militia. In 1902 the army on a war footing numbered 3,323,446 officers and men, divided as follows: Officers (all categories), 36,342; permanent army, 756,771, of whom only 264,516 were serving with the colors; mobile militia, 307,696; territorial militia, 2,222,637. The Italian navy, which is considered of great effectiveness, consisted in 1902 of 2 first-class battleships, 3 second-class battleships, 8 armored cruisers, 4 third-class battleships, 12 protected cruisers, and a large number of torpedo gunboats, destroyers, and small torpedo boats. In addition there are two first-class battleships and several armored and protected cruisers in process of construction, and it is proposed to begin work on three battleships of the first class in 1903. The programme of naval construction will entail an expenditure, by the year 1912, of 389,000,000 lire.

Finance.—The monetary standard is gold, and the unit of value the lira, worth 19.3 cents. The principal sources of revenue are direct and indirect taxes, state enterprises, and monopolies. The budget estimates for the year ending June 30, 1902, placed the revenues at 1,811,924,509 lire and the expenditure at 1,790,959,779 lire. For that year the estimated revenues from the various sources were as follows: Income tax, 290,715,000 lire; customs, 211,050,000 lire; tobacco monopoly, 201,000,000; excise, 103,000,000; land tax, 100,840,000; and house tax, 89,400,000. The principal items of expenditure, according to the same budget were: Public debt, 660,111,901 lire; army, 268,953,132; navy, 122,816,540; instruction, 49,111,699; public works, 92,327,725. The budget for the fiscal year ending June 30, 1903, set the revenues at 1,825,668,501 lire and the expenditure at 1,812,363,541 lire, of which 170,831,011 lire were extraordinary. The national debt amounted, in 1900, to 12,645,289,334 lire; the amortization for the year 1902 was only 2,492,830 lire. A bond issue of new $3\frac{1}{2}$ per cent. stock to the value of 100,000,000 lire at .96, intended to replace part of the floating treasury debt was announced in June, 1902.

Production and Industry.—Over 70 per cent. of the area of Italy is productive, and more than three-fifths of the laboring population is engaged in agriculture, but methods of cultivation are very antiquated. The principal products are wheat, maize, barley, rice, wine, olive-oil, tobacco, and fruits. The wheat crop in 1901 was estimated at 52,000,000 hectolitres (one hectolitre = 2.838 bushels), as compared with 45,030,000 hectolitres in 1900. Other figures for production, for the year 1900 were: Maize, 30,400,000 hectolitres; rice, 5,950,000 hectolitres; wine, 29,900,000 hectolitres (one liquid hectolitre = 26.417 gallons), as compared with 32,500,000 hectolitres in 1899; olive oil, 1,493,000 hectolitres, an increase from 870,000 hectolitres in 1899. Silk culture is a growing industry, being most extensively carried on in Piedmont and Lombardy. The annual production of silk cocoons averages 50,500,000 kilogrammes, and of silk, 4,470,000 kilogrammes (one kilogramme = 2.2046 pounds). Sheep-raising is of considerable importance. The output of raw-sugar factories and refineries, in 1901, was estimated at 55,000 metric tons, an increase from 7960 metric tons in 1899. The average yield from forest products (including chestnuts) is estimated at 88,000,000 lire annually. Italy is rich in minerals, the total value of such products in 1900 reaching 85,060,002 lire, as compared with 91,392,468 lire in 1899. The value of the output of the principal minerals in 1900 in lire was: Sulphur, 41,701,381; zinc, 16,408,481; lead, 7,238,965; iron, 4,585,522; salt, graphite, petroleum, etc., 4,174,853; mineral fuel, 3,542,355; and copper, 3,169,842. The number of mine laborers in 1900 was 67,748. The annual output of the marble quarries averages nearly 33,000,000 lire in value.

Commerce and Communications.—Foreign trade is in a flourishing condition, both imports and exports showing a steady annual increase, the former having increased from 1,191,599,000 lire in 1897 to 1,718,489,000 in 1901, and the latter from 1,091,734,000 lire to 1,374,458 in the same period. The imports include food-stuffs, textiles, coal, iron, and machinery. Silk is by far the most important article of export, the value of its exportation showing an increase in value from 349,061,500 lire in 1900, to 433,000,000 lire in 1901. Other items of export in 1901 with their values in lire were: Silk tissues, 75,500,000; cotton tissues, 53,000,000; eggs, 47,900,000; olive oil, 45,700,000 (31,935,708 lire in 1900); sulphur, 41,200,000; wood and straw manufactures, 39,700,000; and wine, 38,700,000. The principal countries furnishing imports to Italy in 1901 in order of importance were: Great Britain, 279,400,000 lire; United States, 234,300,000; Germany, 205,600,000; followed by France, Austria-Hungary, and Russia. The exports go largely to Germany, Switzerland, France, Great Britain, United States, and Austria-Hungary, in the order named. The total length of railways in operation in Italy in 1900 was 0810 miles. A greater part of the lines are owned by the state but operated by private companies.

HISTORY.

The Cabinet Crisis.—The king opened parliament in person on February 20, 1902. Nothing in the speech from the throne was important except a suggestion for a

modification of Italian divorce laws in order to bring them more into conformity with the divorce laws of other European countries. This statement aroused the resentment of some of the more ardent Roman Catholics, and led to the withdrawal from the cabinet of the minister of public works, Count Giusso, whose conscience refused to allow him to remain longer identified officially with a government that looked with favor or leniency upon a doctrine so strongly at variance with the tenets of the Catholic Church. On the day after the opening, the government attempted to bring about the election of Signor Villa as president of the chamber, but found its purpose unexpectedly blocked, several attempts being frustrated by a strong opposition, united for the time being, who insisted on voting blank ballots. The opposition, it was discovered, was composed largely of Socialists who were dissatisfied with the government's position toward labor and hoped to bring it to terms, and of deputies from southern Italy, where the church influence is particularly strong. The latter opposed the government because of its attitude regarding divorce. Premier Zanardelli and his colleagues immediately resigned, but the king feeling that failure to elect the government candidate was not an actual defeat in the parliamentary sense, refused to accept the resignations. By the time the chamber convened again, the government by effecting a settlement of the threatened railway strike had won back the support of the Socialists, and with a majority of 92 votes had no difficulty in electing Signor Biancheri president of the chamber, as well as naming the other officers of that body from the ranks of the ministerial supporters.

The Threatened Railway Strike.—The disagreement between the Italian railroads and their employees, which had been causing trouble for a year or more, reached a critical stage early in March, 1902. The Italian railways, most of which are owned by the state, are operated by private companies under a stipulation that the control shall revert to the state whenever the companies are unable to guarantee a continuation of service. The railway employees have long demanded better pay, arranged on a regular progressive scale, shorter hours of labor, and a reorganization of their service on a regular bureaucratic basis. In January, 1902, they sent an ultimatum to the companies embodying these demands. The companies appealed to the government, which at first adopted a strict policy. Official proclamations were posted notifying the employees that all were public officials and that failure to discharge their duties would render them liable to penalties under the penal code. Another move was the placing under martial law of some 24,000 railway workmen liable to military service. On February 10 the companies agreed to add about 1,700,000 lire to their annual pay roll, but still the employees were not satisfied. Thereupon military reserves to the number of 55,000 were called out, and the minister of war assumed control of the telegraph system. At this juncture occurred the government defeat in the chamber, attributed partly to the Socialists, who were dissatisfied with the government's attitude toward the railway employees. At once the government adopted more conciliatory methods. After considerable negotiating an agreement was reached for a temporary settlement to hold until the lapsing of the greater part of the companies' leases in 1905. By this settlement the government agreed to three annual installments aggregating about 33,000,000 lire toward a total of something over 42,000,000 lire demanded by the employees as a provisional concession, the companies agreeing to pay the balance. By this arrangement the strike was averted but there was an understanding that the demand for the reorganization of the service on a bureaucratic basis would be given attention at some time in the near future.
